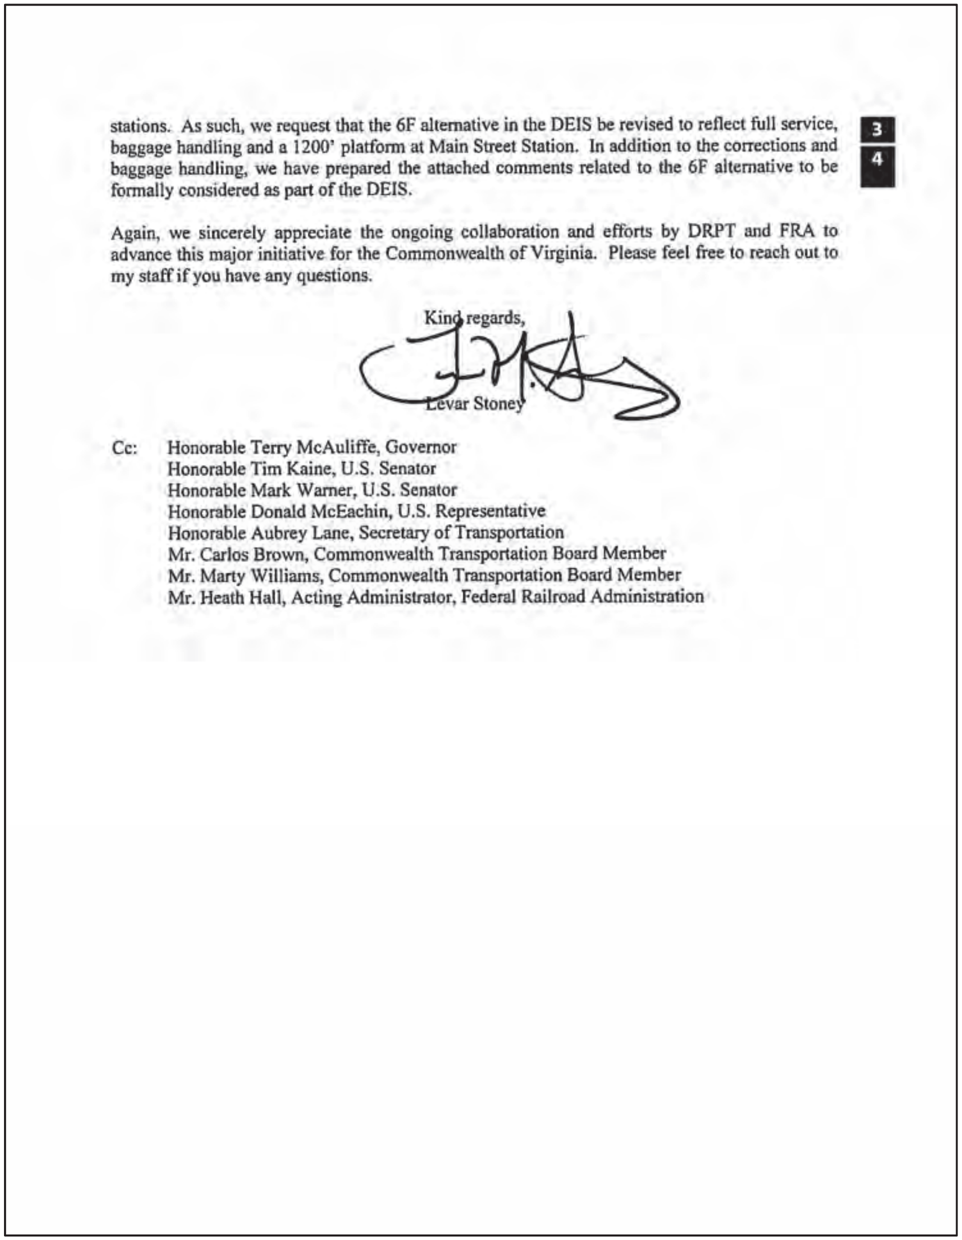
include the Interstate Corridor and Long Distance service at Main Street Station. In addition, we
formally request that DRPT and the FRA include baggage handling and the necessary 1200' 3
platform in the Service Development Plan and the next phase of the process that includes 30%
design and engineering. The Service Development Plan will provide the most accurate information
regarding any operational impacts from adding baggage service. Deciding not to accommodate
the service at this point in the process, may unnecessarily eliminate a valuable amenity for our
residents, businesses and tourists and create confusion between available services at our Region's

900 East Broad Street, Suite 201 • Richmond, Virginia 23219 • (804) 646-7970

CITY OF RICHMOND

1. DRPT notes the City's recommendation of Build Alternative 6F: Full Service (Staples Mill Road Station and Main Street Station), which has been selected as the Preferred Alternative for inclusion in the Final EIS.
2. DRPT agrees that an incorrect summary of Build Alternative 6F with regard to service at Main Street Station was provided in the "Recommended Preferred Alternative" section of the Draft EIS Executive Summary (note that the full detailed descriptions provided in Chapters 2 and 7 of the Draft EIS were correct). The Draft Executive Summary text has been corrected; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS. Additionally, DRPT has ensure that all descriptions of Alternative 6F are correct throughout the Final EIS.
3. The City provided detailed comments regarding 1,200-foot platforms on the west side of Main Street Station in their attachment; refer to DRPT-numbered statements #10 through #15 for response.



stations. As such, we request that the 6F alternative in the DEIS be revised to reflect full service, baggage handling and a 1200' platform at Main Street Station. In addition to the corrections and baggage handling, we have prepared the attached comments related to the 6F alternative to be formally considered as part of the DEIS. 3 4

Again, we sincerely appreciate the ongoing collaboration and efforts by DRPT and FRA to advance this major initiative for the Commonwealth of Virginia. Please feel free to reach out to my staff if you have any questions.

Kind regards,

Levar Stoney

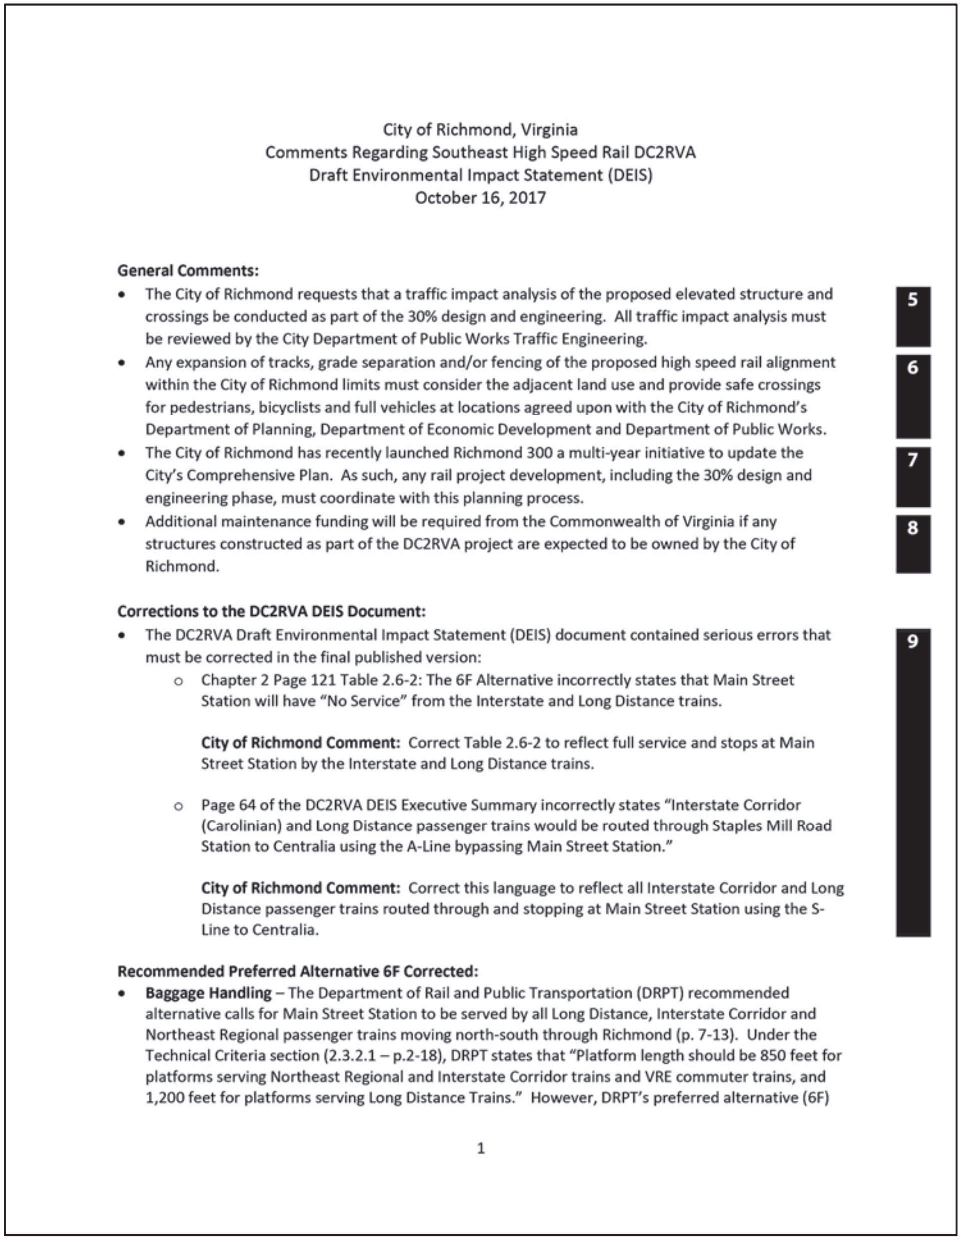
4. DRPT responded to the City's attached comments; refer to DRPT-numbered statements #5 through #36 below



City of Richmond, Virginia
Comments Regarding Southeast High Speed Rail DC2RVA
Draft Environmental Impact Statement (DEIS)
October 16, 2017

General Comments:

- The City of Richmond requests that a traffic impact analysis of the proposed elevated structure and crossings be conducted as part of the 30% design and engineering. All traffic impact analysis must be reviewed by the City Department of Public Works Traffic Engineering. 5
- Any expansion of tracks, grade separation and/or fencing of the proposed high speed rail alignment within the City of Richmond limits must consider the adjacent land use and provide safe crossings for pedestrians, bicyclists and full vehicles at locations agreed upon with the City of Richmond's Department of Planning, Department of Economic Development and Department of Public Works. 6
- The City of Richmond has recently launched Richmond 300 a multi-year initiative to update the City's Comprehensive Plan. As such, any rail project development, including the 30% design and engineering phase, must coordinate with this planning process. 7
- Additional maintenance funding will be required from the Commonwealth of Virginia if any structures constructed as part of the DC2RVA project are expected to be owned by the City of Richmond. 8

Corrections to the DC2RVA DEIS Document:

- The DC2RVA Draft Environmental Impact Statement (DEIS) document contained serious errors that must be corrected in the final published version: 9
    - Chapter 2 Page 121 Table 2.6-2: The 6F Alternative incorrectly states that Main Street Station will have "No Service" from the Interstate and Long Distance trains.

      City of Richmond Comment: Correct Table 2.6-2 to reflect full service and stops at Main Street Station by the Interstate and Long Distance trains.

    - Page 64 of the DC2RVA DEIS Executive Summary incorrectly states "Interstate Corridor (Carolinian) and Long Distance passenger trains would be routed through Staples Mill Road Station to Centralia using the A-Line bypassing Main Street Station."

      City of Richmond Comment: Correct this language to reflect all Interstate Corridor and Long Distance passenger trains routed through and stopping at Main Street Station using the S-Line to Centralia.

Recommended Preferred Alternative 6F Corrected:

- **Baggage Handling** – The Department of Rail and Public Transportation (DRPT) recommended alternative calls for Main Street Station to be served by all Long Distance, Interstate Corridor and Northeast Regional passenger trains moving north-south through Richmond (p. 7-13). Under the Technical Criteria section (2.3.2.1 – p.2-18), DRPT states that "Platform length should be 850 feet for platforms serving Northeast Regional and Interstate Corridor trains and VRE commuter trains, and 1,200 feet for platforms serving Long Distance Trains." However, DRPT's preferred alternative (6F)

1

CITY OF RICHMOND (continued)

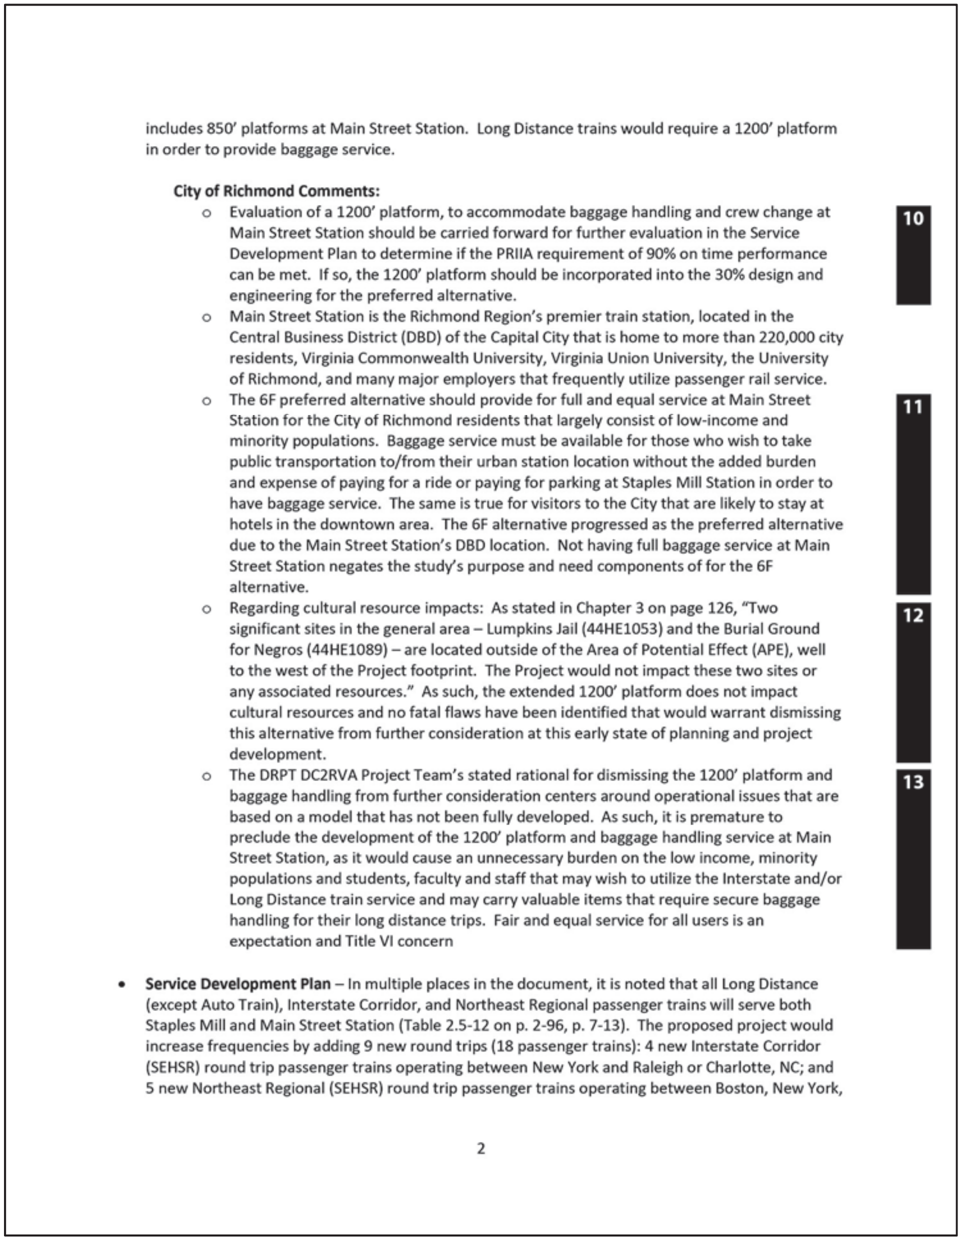
5. The Draft EIS includes a traffic queuing analysis at all at-grade crossings (see Section 4.15.2); the analyses provided are sufficient for the conceptual engineering upon which the Draft EIS analyses are based. Additional review of traffic data to update traffic conditions will be performed for all at-grade crossings, including those recommended for grade separation, as part of final design after funding becomes available and a construction schedule is established.

6. and 7. Comment noted. Land use, comprehensive planning, and land use compatibility of the Preferred Alternative is discussed in Section 5.11 of the Final EIS and bicycle and pedestrian safety is provided in Section 5.18 of the Final EIS, which has been expanded since the Draft EIS. DRPT will coordinate with the City during final design, after funding becomes available and a construction schedule is established, for all work within the City.

8. The DC2RVA Project includes improving track and other rail infrastructure on existing CSXT right-of-way, and while ownership and responsibility for maintenance of proposed Project improvements has not been determined, DRPT anticipates the track and rail infrastructure will be owned and maintained by CSXT. Station improvements, including platforms and parking facilities, would likely be owned and maintained by Amtrak and/or the locality, or other stakeholder.

9. The Build Alternative 6F and Build Alternative 6G rows in Draft EIS Table 2.6-2 were inadvertently switched; the data showing for Build Alternative 6F in the table is appropriate and accurate for Build Alternative 6G, and vice versa. This correction has been made in the Final EIS; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

   In regard to the City's comment on the summary of Alternative 6F within the Draft EIS, refer to DRPT-numbered statement #2.



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. **10**
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. The same is true for visitors to the City that are likely to stay at hotels in the downtown area. The 6F alternative progressed as the preferred alternative due to the Main Street Station's DBD location. Not having full baggage service at Main Street Station negates the study's purpose and need components of for the 6F alternative. **11**
- Regarding cultural resource impacts: As stated in Chapter 3 on page 126, "Two significant sites in the general area – Lumpkins Jail (44HE1053) and the Burial Ground for Negros (44HE1089) – are located outside of the Area of Potential Effect (APE), well to the west of the Project footprint. The Project would not impact these two sites or any associated resources." As such, the extended 1200' platform does not impact cultural resources and no fatal flaws have been identified that would warrant dismissing this alternative from further consideration at this early state of planning and project development. **12**
- The DRPT DC2RVA Project Team's stated rational for dismissing the 1200' platform and baggage handling from further consideration centers around operational issues that are based on a model that has not been fully developed. As such, it is premature to preclude the development of the 1200' platform and baggage handling service at Main Street Station, as it would cause an unnecessary burden on the low income, minority populations and students, faculty and staff that may wish to utilize the Interstate and/or Long Distance train service and may carry valuable items that require secure baggage handling for their long distance trips. Fair and equal service for all users is an expectation and Title VI concern **13**

- **Service Development Plan** – In multiple places in the document, it is noted that all Long Distance (except Auto Train), Interstate Corridor, and Northeast Regional passenger trains will serve both Staples Mill and Main Street Station (Table 2.5-12 on p. 2-96, p. 7-13). The proposed project would increase frequencies by adding 9 new round trips (18 passenger trains): 4 new Interstate Corridor (SEHSR) round trip passenger trains operating between New York and Raleigh or Charlotte, NC; and 5 new Northeast Regional (SEHSR) round trip passenger trains operating between Boston, New York,

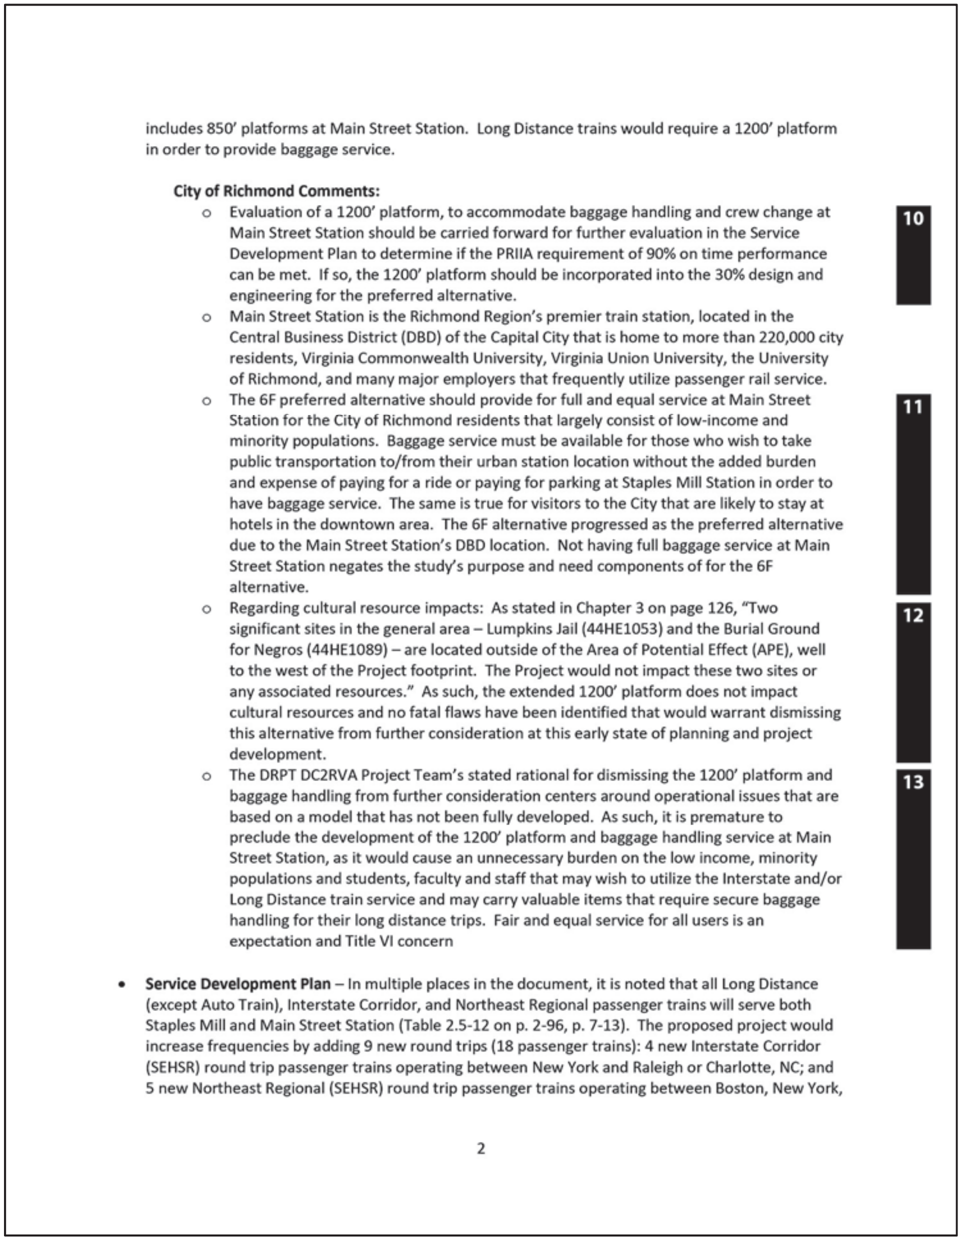
2

CITY OF RICHMOND (continued)

10. through 15. To streamline answers to the City's many concerns at Main Street Station as part of the Preferred Alternative 6F, DRPT has provided a summary explanation for the selection of 6F as the Preferred alternative, followed by response to five topic areas, below:

The DC2RVA Project will add a second track on each side of Main Street Station using the existing elevated rail trestles/viaducts, which currently have one operating track on each side where two tracks previously existed. The two tracks on both east and west sides of the station will be used by both freight and passenger services. The Project will also add two low-level platforms on each side of the station (a total of four platforms). Platforms on the east side of the station will extend 850 feet by 15 feet wide. Platforms on the west side of the station will extend 950 feet by 15 feet wide. The east and west-side platforms adjacent to the station (the "inside" platforms) will incorporate the platforms built into the renovated train shed and extend them north on new structures parallel to the existing track viaduct. These platforms will be accessible from the train shed. The "outside" east and west-side platforms will be built on new structures adjacent to the existing east and west viaducts. Elevators and staircases will provide access to the outside platforms from ground level. The Project will also add a walkway attached to both sides of the western viaduct, extending approximately 200 feet north and south from the new platform ends. The walkways will provide crew the ability to safely enter/exit rail cars that extend beyond the platforms when a passenger train longer than 850 feet is stopped at the station. DRPT will coordinate with the City of Richmond to develop a parking plan for Main Street Station's future intercity passenger needs in conjunction with the City's plans for its property around Main Street Station and other development within Shockoe Valley.

(Responses are continued on next page)



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. 10
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. The same is true for visitors to the City that are likely to stay at hotels in the downtown area. The 6F alternative progressed as the preferred alternative due to the Main Street Station's DBD location. Not having full baggage service at Main Street Station negates the study's purpose and need components of for the 6F alternative. 11
- Regarding cultural resource impacts: As stated in Chapter 3 on page 126, "Two significant sites in the general area – Lumpkins Jail (44HE1053) and the Burial Ground for Negros (44HE1089) – are located outside of the Area of Potential Effect (APE), well to the west of the Project footprint. The Project would not impact these two sites or any associated resources." As such, the extended 1200' platform does not impact cultural resources and no fatal flaws have been identified that would warrant dismissing this alternative from further consideration at this early state of planning and project development. 12
- The DRPT DC2RVA Project Team's stated rational for dismissing the 1200' platform and baggage handling from further consideration centers around operational issues that are based on a model that has not been fully developed. As such, it is premature to preclude the development of the 1200' platform and baggage handling service at Main Street Station, as it would cause an unnecessary burden on the low income, minority populations and students, faculty and staff that may wish to utilize the Interstate and/or Long Distance train service and may carry valuable items that require secure baggage handling for their long distance trips. Fair and equal service for all users is an expectation and Title VI concern 13

- **Service Development Plan** – In multiple places in the document, it is noted that all Long Distance (except Auto Train), Interstate Corridor, and Northeast Regional passenger trains will serve both Staples Mill and Main Street Station (Table 2.5-12 on p. 2-96, p. 7-13). The proposed project would increase frequencies by adding 9 new round trips (18 passenger trains): 4 new Interstate Corridor (SEHSR) round trip passenger trains operating between New York and Raleigh or Charlotte, NC; and 5 new Northeast Regional (SEHSR) round trip passenger trains operating between Boston, New York,

2

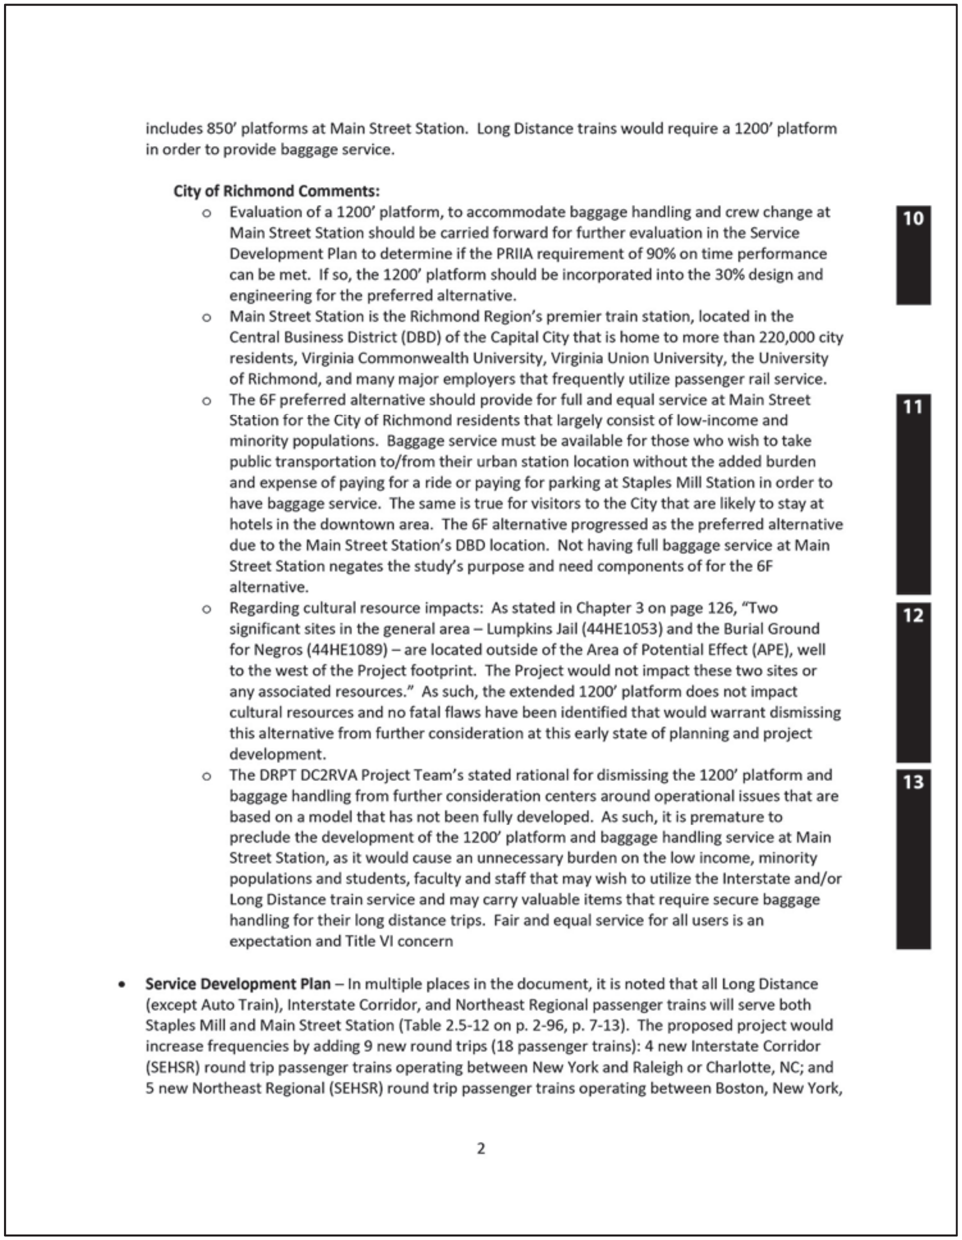
CITY OF RICHMOND (continued)

DRPT considered and dismissed adding a third track on the west side of the station due to site constraints and potential impacts to cultural resources in the area. DRPT also considered and dismissed making the west side platforms 1,200 feet long in keeping with the Project's Basis of Design to fully accommodate long-distance trains, opting instead for a reduced platform length of 950 feet plus an extended walkway, owing to site constraints and to minimize potential impacts to cultural resources. Chapter 4 of the Final EIS clarifies that while Main Street Station site constraints and concerns over potential impacts to cultural resources limit the number of tracks and length of platforms proposed for the station, future passenger service amenities to be provided at the station, such as checked baggage service, are not precluded. Amenities to be provided at each station for a particular passenger service will be determined through coordination between Amtrak, the City of Richmond, and other station stakeholders, and are not included as part of the DC2RVA Project. DRPT has assumed that Amtrak's scheduled crew changes in the Richmond area, which currently occur at Staples Mill Road Station, would continue to occur at Staples Mill Road Station under this alternative. DRPT also included a parking deck on the east side of Main Street Station in the Draft EIS; this parking deck has been dismissed from consideration in lieu of coordinating with the City to develop a Main Street Station parking plan when future service is implemented.

Site Constraints at Main Street Station

Historically, Main Street Station was served by two tracks on the west and two tracks on the east, all on elevated railroad trestle/viaduct. Currently, there is only one track operating on each side of the station on the existing viaducts. DRPT considered adding one or more main tracks on the west side of the station, and determined that one additional track could be added to the viaduct which was constructed for and previously supported two tracks. Any additional track would need to be on new structure and located approximately 35 feet west of the existing rail viaduct to accommodate an island platform of 24 feet width at the station. Site constraints that preclude adding a third track on the west side include:

(Responses are continued on next page)



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. **10**
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. The same is true for visitors to the City that are likely to stay at hotels in the downtown area. The 6F alternative progressed as the preferred alternative due to the Main Street Station's DBD location. Not having full baggage service at Main Street Station negates the study's purpose and need components of for the 6F alternative. **11**
- Regarding cultural resource impacts: As stated in Chapter 3 on page 126, "Two significant sites in the general area – Lumpkins Jail (44HE1053) and the Burial Ground for Negros (44HE1089) – are located outside of the Area of Potential Effect (APE), well to the west of the Project footprint. 2

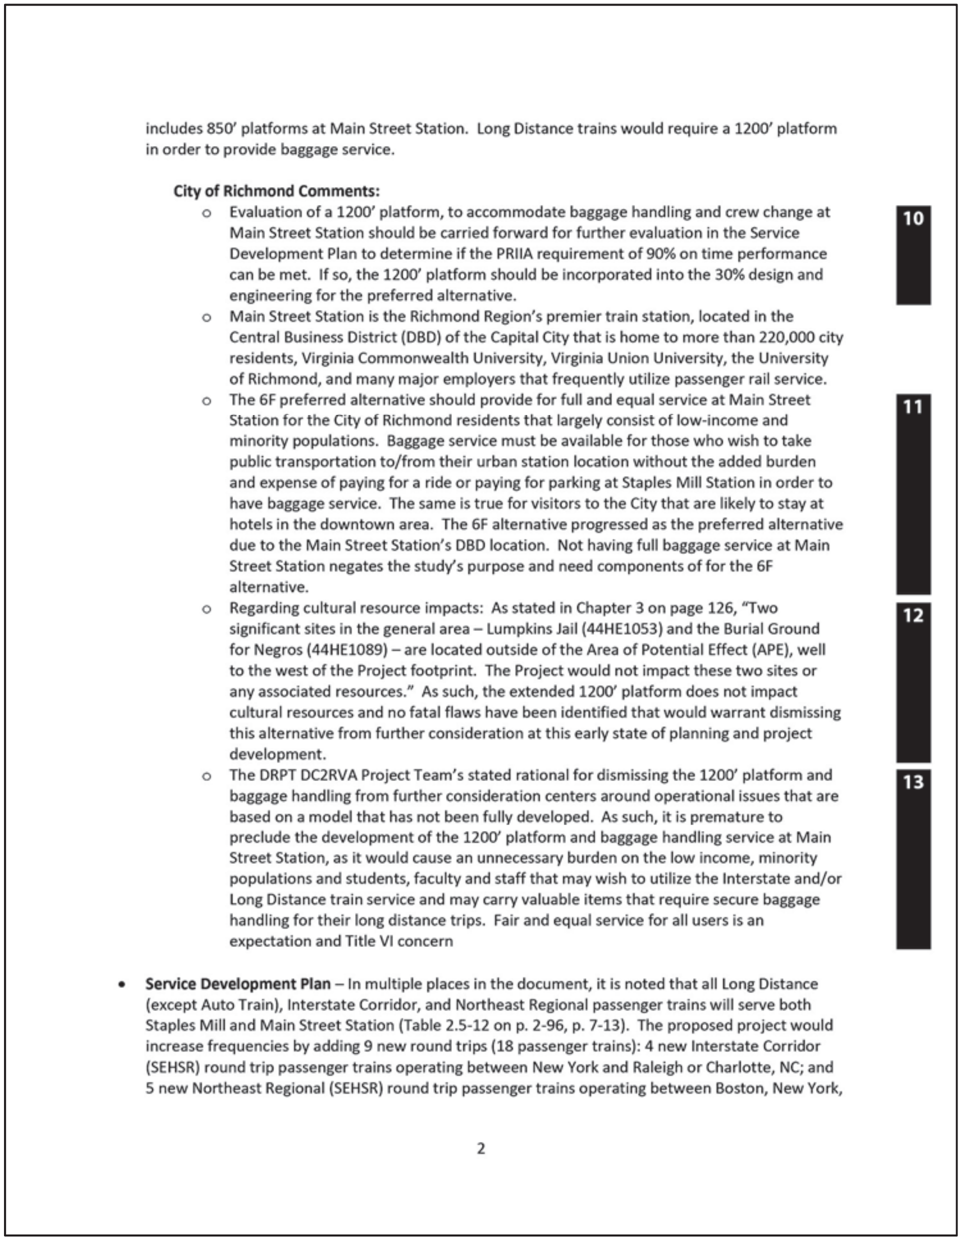
CITY OF RICHMOND (continued)

- The viaduct on the west side of the station threads between two piers (located at the southwest corner of the station building adjacent to East Main Street) supporting I-95 elevated above the viaduct. These and multiple other piers adjacent to the viaduct just south of the station preclude adding an additional track.
- Approximately 1,100 feet south of the station, the viaduct passes through the middle tier of the "triple crossing", an iconic grade-separated rail crossing of three rail lines. The existing viaduct opening is sized for only two tracks, and would not allow a third track without replacing the triple crossing structure.
- Approximately 500 feet north of the renovated train shed, the rail viaducts pass over E. Broad Street. The vertical clearance for Broad Street beneath the rail viaducts is 13 feet-8 inches, which is less than the VDOT standard of 16 feet-6 inches. Broad Street also slopes upward west of the rail viaduct to climb over I-95. Adding a third track across Broad Street 35 feet west of the existing west viaduct would compound the roadway vertical clearance limitations.

DC2RVA's Basis of Design, following Amtrak's Station Program and Planning Guidelines (2013), calls for 1,200 feet long platforms for stations servicing Amtrak's Long Distance passenger trains and 850 feet long platforms for stations serving only Regional passenger trains. The Basis of Design matches the length of the platforms to the length of the train consists, with the goal of allowing direct access from the entire train – locomotive, passenger cars, etc. – to the platform with a single stop. Matching the platform length to the train consist optimizes passenger access, and allows crew members to exit the train safely at the station if needed. DRPT considered adding two 1,200 feet long platforms on the west side of the station that would accommodate the full length of Long Distance trains. However, DRPT determined that two 1,200 feet platforms were not practical on the west side due to physical site constraints and potential impacts to cultural resources. Site constraints that precluded extending the platforms to 1,200 feet are similar to those affecting adding a third track, and include:

(Responses are continued on next page)



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. 10
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.

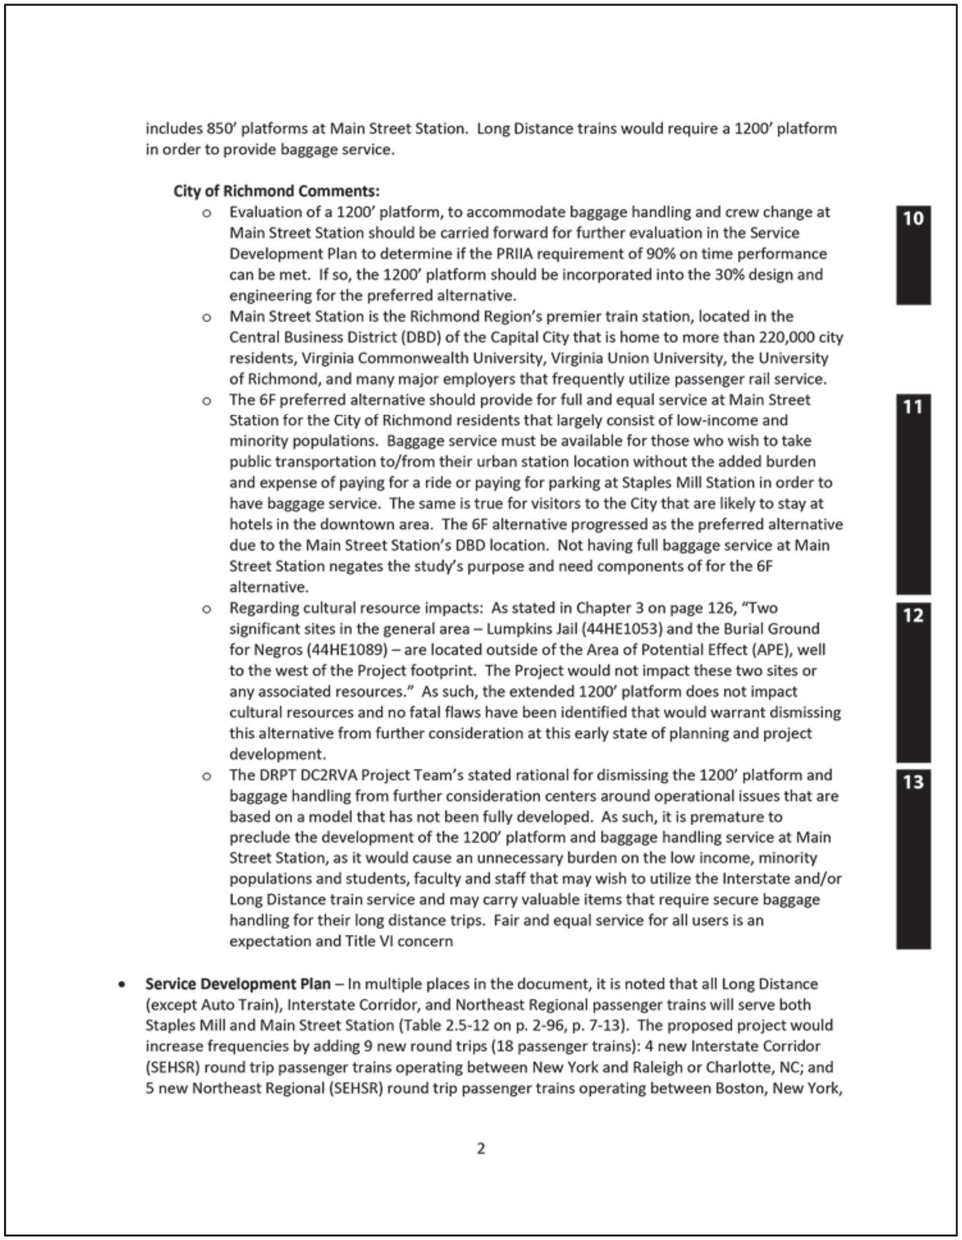
2

CITY OF RICHMOND (continued)

- The viaduct on the west side of the station threads between two piers (located at the southwest corner of the station building adjacent to East Main Street) supporting I-95 elevated above the viaduct. These piers physically prevent the west side platforms from extending south.
- Approximately 500 feet north of the renovated train shed, the viaducts pass over E. Broad Street. The vertical clearance for Broad Street beneath the rail viaducts is 13 feet-8 inches, which is less than the VDOT standard of 16 feet-6 inches. Broad Street also slopes upward west of the rail viaducts to climb over I-95. Adding a platform across Broad Street on the west would compound the roadway clearance limitations in order to maintain access to an extended platform.
- The existing rail trestle bridge over Broad Street is an approximately 75 feet thru-truss girder span that prevents access to the tracks from a platform over Broad Street – thus any platform extending north from the station across Broad Street would have an approximately 75 feet gap with no access to the train.

A platform length of 950 feet is the maximum that can be added on the west side without conflict with either the I-95 piers at the southern end, or vertical clearance and track access over Broad Street at the northern end. The use of walkways along the track viaducts extending 200 feet in each direction from the ends of the platform allows crew members to safely exit the train at the station if necessary.

(Responses are continued on next page)



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. 10
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. CITY OF RICHMOND (continued)

Concerns for Potential Impacts to Cultural Resources at Main Street Station

Multiple comments received by DRPT and FRA on the Draft EIS cited concerns over potential impacts from the Project to cultural resources in the Shockoe Bottom and Shockoe Valley area around Main Street Station. This includes comments from consulting parties (including the City of Richmond) and other groups and individuals with a vested interest in this area. The City of Richmond as a consulting party has received copies of all 22 technical reports produced on the corridor, associated correspondence, and coordination, and have attended meetings and telephone calls regarding cultural resource issues. The City will continue to be informed of all cultural resource tasks throughout the duration of the Project.

Comments received from all parties regarding this area cite both known architectural and archaeological resources in the area, as well as resources that may be in the area but are not yet identified or clearly defined. Of particular concern to many is the past history of Shockoe Bottom as a slave trading center, the proximity to Lumpkins Jail (Devil's Half-Acre) and the Burial Ground, and the Project's potential effects on "sacred ground". There is also concern that the Project could interfere with development of a memorial to the slave trading history of this area. While the Project footprint does not impact any known archaeological or historic site adjacent to Main Street Station associated with the slave trade, DRPT and FRA determined that minimizing the footprint in this area would reduce any potential impacts to the cultural resources concerns noted above, such as minimizing the platform length to reduce subsurface impacts in this area and eliminating the proposed parking deck. Additionally, at the request of several consulting parties, Lumpkins Jail site was added to the list of historic properties. The DHR determined that the Project will have no adverse effect on the site as no impacts will occur as part of the Project. However, a commitment to create a historic context on the Shockoe Bottom area and the slave trade is included in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS).

includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- 10 Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative.
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- 11 The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. The same is true for visitors to the City that are likely to stay at hotels in the downtown area. The 6F alternative progressed as the preferred alternative due to the Main Street Station's DBD location. Not having full baggage service at Main Street Station negates the study's purpose and need components of for the 6F alternative.
- 12 Regarding cultural resource impacts: As stated in Chapter 3 on page 126, "Two significant sites in the general area – Lumpkins Jail (44HE1053) and the Burial Ground for Negros (44HE1089) – are located outside of the Area of Potential Effect (APE), well to the west of the Project footprint. The Project would not impact these two sites or any associated resources." As such, the extended 1200' platform does not impact cultural resources and no fatal flaws have been identified that would warrant dismissing this alternative from further consideration at this early state of planning and project development.
- 13 The DRPT DC2RVA Project Team's stated rational for dismissing the 1200' platform and baggage handling from further consideration centers around operational issues that are based on a model that has not been fully developed. As such, it is premature to preclude the development of the 1200' platform and baggage handling service at Main Street Station, as it would cause an unnecessary burden on the low income, minority populations and students, faculty and staff that may wish to utilize the Interstate and/or Long Distance train service and may carry valuable items that require secure baggage handling for their long distance trips. Fair and equal service for all users is an expectation and Title VI concern

- **Service Development Plan** – In multiple places in the document, it is noted that all Long Distance (except Auto Train), Interstate Corridor, and Northeast Regional passenger trains will serve both Staples Mill and Main Street Station (Table 2.5-12 on p. 2-96, p. 7-13). The proposed project would increase frequencies by adding 9 new round trips (18 passenger trains): 4 new Interstate Corridor (SEHSR) round trip passenger trains operating between New York and Raleigh or Charlotte, NC; and 5 new Northeast Regional (SEHSR) round trip passenger trains operating between Boston, New York,

2

CITY OF RICHMOND (continued)

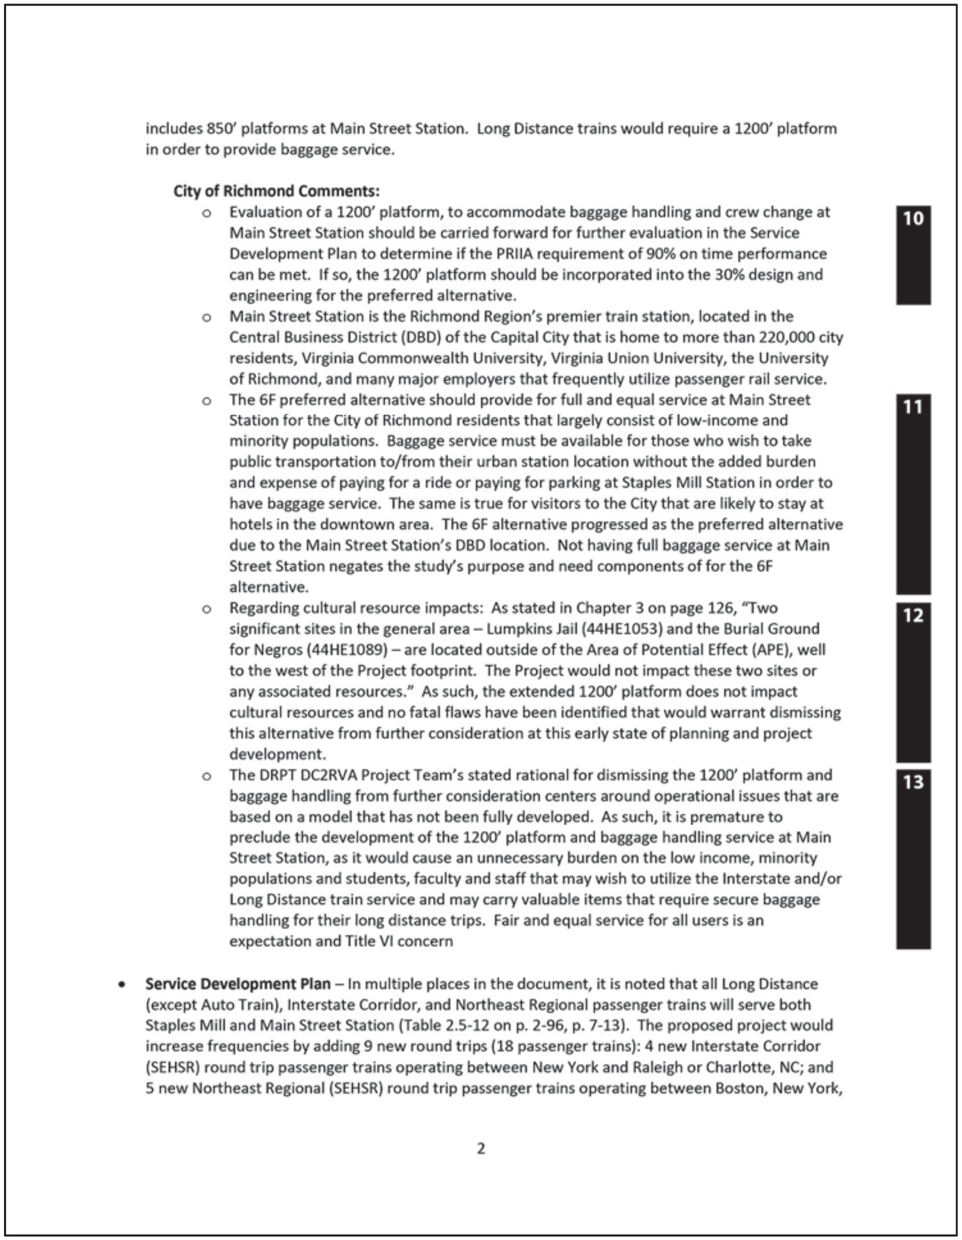
Sections 3.1, 5.13.1, 5.13.2, 5.13.3, 5.20.1.3, 6.5.3, 6.6.1, and 6.7 of the Final EIS provides further discussion of the Project's effects to cultural resources in the Shockoe Bottom.

Station Amenities

Amenities to be provided at each station for a particular passenger service will be determined prior to the inception of service through coordination between Amtrak, the station owner/operator, and other stakeholders, and are not included as part of the DC2RVA Project. DRPT has applied Amtrak's Station Program and Planning Guidelines (2013) to determine the general size or footprint of each station building based on 2045 ridership projections for the recommended preferred alternative. Each station is sized to accommodate various crew, passenger and service amenities based on the projected train service and ridership. While the potential cost of the station is included within the DC2RVA Project, the determination of the actual size, design and layout of each station, and the staffing and configuration of station and service amenities, including parking, is not part of the DC2RVA Project.

All of Amtrak's passenger cars have room for passengers to carry on and stow a limited number of bags. In addition, Amtrak typically provides checked baggage service with its Long Distance service, and may also provide checked baggage service with Interstate Corridor and some Regional trains as determined by Amtrak, its state funding partners, and other stakeholders. The provision of checked baggage service at Main Street Station is not precluded by the proposed platform sizes. In the current Amtrak timetable, ten (five round-trip) of the 18 (nine round-trip) trains that serve Richmond (Staples Mill Road Station) have checked baggage service, including: the two Northeast Regional (Virginia-supported) trains (one round-trip) that operate overnight on the Northeast Corridor and extend to Newport News (#66/67) and eight (four round-trip) trains that extend south of Virginia (Silver Star, Silver Meteor, Palmetto and Carolinian). The other four Northeast Regional (Virginia-supported) trains that serve Richmond, Newport News and Norfolk do not have baggage service.

(Responses are continued on next page)



includes 850' platforms at Main Street Station. Long Distance trains would require a 1200' platform in order to provide baggage service.

City of Richmond Comments:

- Evaluation of a 1200' platform, to accommodate baggage handling and crew change at Main Street Station should be carried forward for further evaluation in the Service Development Plan to determine if the PRIIA requirement of 90% on time performance can be met. If so, the 1200' platform should be incorporated into the 30% design and engineering for the preferred alternative. 10
- Main Street Station is the Richmond Region's premier train station, located in the Central Business District (DBD) of the Capital City that is home to more than 220,000 city residents, Virginia Commonwealth University, Virginia Union University, the University of Richmond, and many major employers that frequently utilize passenger rail service.
- The 6F preferred alternative should provide for full and equal service at Main Street Station for the City of Richmond residents that largely consist of low-income and minority populations. Baggage service must be available for those who wish to take public transportation to/from their urban station location without the added burden and expense of paying for a ride or paying for parking at Staples Mill Station in order to have baggage service. The same is true for visitors to the City that are likely to stay at hotels in the downtown area. The 6F alternative progressed as the preferred alternative due to the Main Street Station's DBD location. Not having full baggage service at Main Street Station negates the study's purpose and need components of for the 6F alternative. 11
- Regarding cultural resource impacts: As stated in Chapter 3 on page 126, "Two significant sites in the general area – Lumpkins Jail (44HE1053) and the Burial Ground for Negros (44HE1089) – are located outside of the Area of Potential Effect (APE), well to the west of the Project footprint. The Project would not impact these two sites or any associated resources." As such, the extended 1200' platform does not impact cultural resources and no fatal flaws have been identified that would warrant dismissing this alternative from further consideration at this early state of planning and project development. 12
- The DRPT DC2RVA Project Team's stated rational for dismissing the 1200' platform and baggage handling from further consideration centers around operational issues that are based on a model that has not been fully developed. As such, it is premature to preclude the development of the 1200' platform and baggage handling service at Main Street Station, as it would cause an unnecessary burden on the low income, minority populations and students, faculty and staff that may wish to utilize the Interstate and/or Long Distance train service and may carry valuable items that require secure baggage handling for their long distance trips. Fair and equal service for all users is an expectation and Title VI concern 13

- **Service Development Plan** – In multiple places in the document, it is noted that all Long Distance (except Auto Train), Interstate Corridor, and Northeast Regional passenger trains will serve both Staples Mill and Main Street Station (Table 2.5-12 on p. 2-96, p. 7-13). The proposed project would increase frequencies by adding 9 new round trips (18 passenger trains): 4 new Interstate Corridor (SEHSR) round trip passenger trains operating between New York and Raleigh or Charlotte, NC; and 5 new Northeast Regional (SEHSR) round trip passenger trains operating between Boston, New York,

2

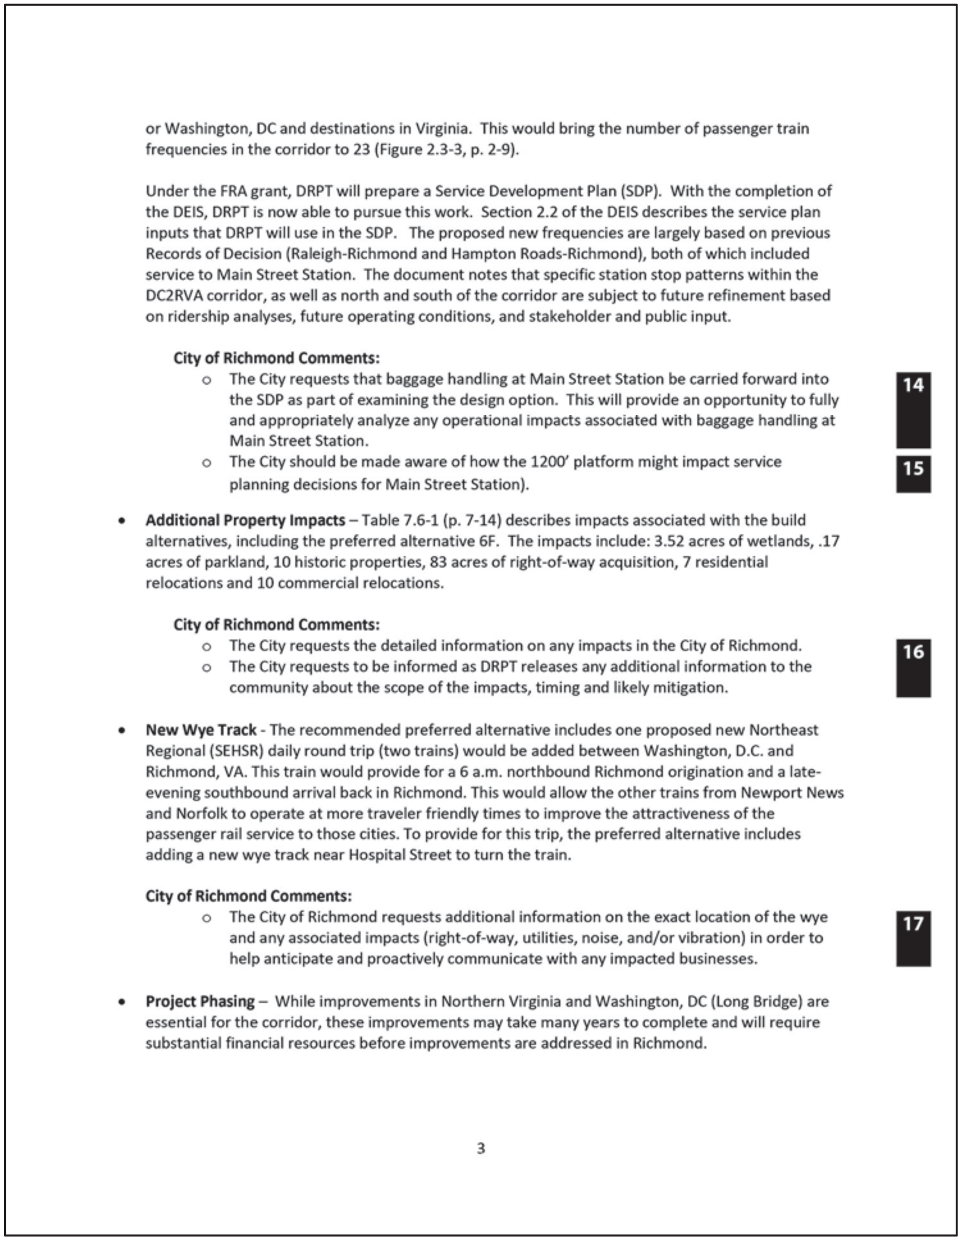
CITY OF RICHMOND (continued)

In the future, when the additional passenger service frequencies proposed by the DC2RVA Project are added to Main Street Station, the provision of checked baggage service will be determined in coordination between Amtrak, its state funding partners, the City of Richmond, and other station stakeholders.

Simulation Model / Service Development Plan

The City stated that it was premature to preclude development of 1,200-foot platforms and checked baggage handling based on the simulations modeling, and requested that these options be carried forward in the Service Development Plan. Although DRPT recognizes that a 1,200-foot platform length is preferred for stations served by Long Distance trains due to their greater length, DRPT has chosen a 950 feet platform length for the west side of Main Street Station due to site constraints which restrict longer platforms and to avoid/reduce potential impacts to cultural resources from longer platforms. DRPT has proposed to extend walkways along the existing track viaduct to accommodate safe crew movements between train and station in lieu of longer platforms. DRPT has also chosen an 850 feet platform length for the east side in keeping with the Project's Basis of Design for the level of service. The proposed 950 feet and 850 feet platforms serve the Project's Purpose and Need with less impacts and less cost than the longer 1,200-foot platforms, and do not preclude checked baggage service at the station. DRPT's computerized operations simulation modeling described above and in the Draft EIS was conducted to inform the comparison of Project alternatives. Subsequent operations simulation modeling reported in the Final EIS validates that the infrastructure proposed in the preferred alternative meets service performance goals defined in the Purpose and Need; refer to Section 3.2 of the Final EIS for details.

(Responses are continued on next page)



or Washington, DC and destinations in Virginia. This would bring the number of passenger train frequencies in the corridor to 23 (Figure 2.3-3, p. 2-9).

Under the FRA grant, DRPT will prepare a Service Development Plan (SDP). With the completion of the DEIS, DRPT is now able to pursue this work. Section 2.2 of the DEIS describes the service plan inputs that DRPT will use in the SDP. The proposed new frequencies are largely based on previous Records of Decision (Raleigh-Richmond and Hampton Roads-Richmond), both of which included service to Main Street Station. The document notes that specific station stop patterns within the DC2RVA corridor, as well as north and south of the corridor are subject to future refinement based on ridership analyses, future operating conditions, and stakeholder and public input.

City of Richmond Comments:

- ○ The City requests that baggage handling at Main Street Station be carried forward into the SDP as part of examining the design option. This will provide an opportunity to fully and appropriately analyze any operational impacts associated with baggage handling at Main Street Station. 14
- ○ The City should be made aware of how the 1200' platform might impact service planning decisions for Main Street Station). 15

- **Additional Property Impacts** – Table 7.6-1 (p. 7-14) describes impacts associated with the build alternatives, including the preferred alternative 6F. The impacts include: 3.52 acres of wetlands, .17 acres of parkland, 10 historic properties, 83 acres of right-of-way acquisition, 7 residential relocations and 10 commercial relocations.

City of Richmond Comments:

- ○ The City requests the detailed information on any impacts in the City of Richmond. 16
- ○ The City requests to be informed as DRPT releases any additional information to the community about the scope of the impacts, timing and likely mitigation.

- **New Wye Track** - The recommended preferred alternative includes one proposed new Northeast Regional (SEHSR) daily round trip (two trains) would be added between Washington, D.C. and Richmond, VA. This train would provide for a 6 a.m. northbound Richmond origination and a late-evening southbound arrival back in Richmond. This would allow the other trains from Newport News and Norfolk to operate at more traveler friendly times to improve the attractiveness of the passenger rail service to those cities. To provide for this trip, the preferred alternative includes adding a new wye track near Hospital Street to turn the train.

City of Richmond Comments:

- ○ The City of Richmond requests additional information on the exact location of the wye and any associated impacts (right-of-way, utilities, noise, and/or vibration) in order to help anticipate and proactively communicate with any impacted businesses. 17

- **Project Phasing** – While improvements in Northern Virginia and Washington, DC (Long Bridge) are essential for the corridor, these improvements may take many years to complete and will require substantial financial resources before improvements are addressed in Richmond.

3

CITY OF RICHMOND (continued)

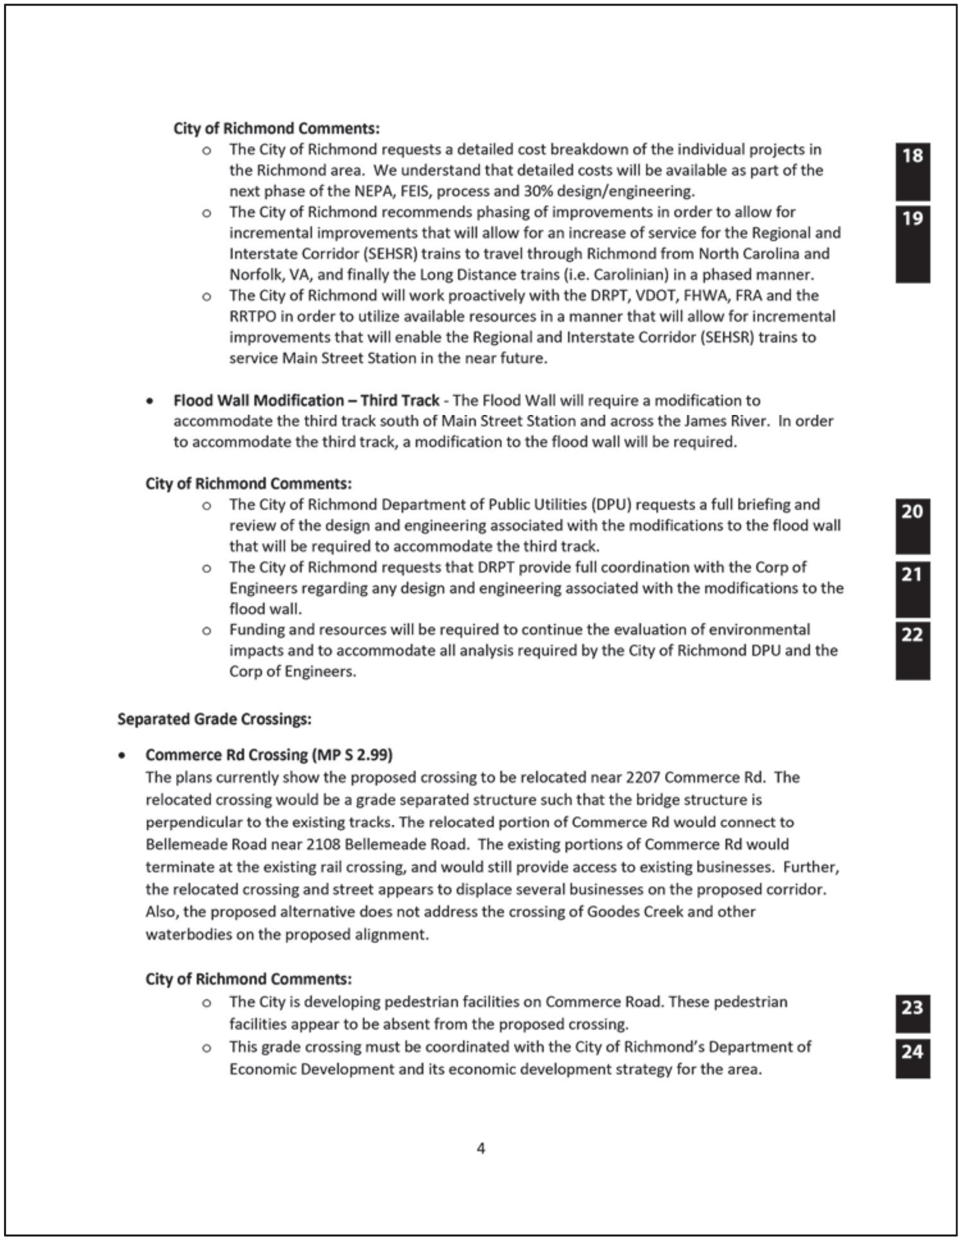
Title VI & Environmental Justice

As noted above, Alternative 6F would provide increased levels of train service to all users at both Main Street Station and Staples Mill Road Station. Section 4.3.6 of the Final EIS clarifies that while Main Street Station site constraints and concerns over potential impacts to cultural resources limit the number of tracks and length of platforms proposed for the station, future passenger service amenities to be provided at the station, such as checked baggage service, are not precluded. Amenities to be provided at each station for a particular passenger service will be determined through coordination between Amtrak, the City of Richmond, and other station stakeholders when the service is implemented, and are not included as part of the DC2RVA Project.

16. Chapter 5 of the Final EIS provides potential Project impacts of the Preferred Alternative in the City of Richmond.

    DRPT has met with the City and its adjacent localities, including Hanover County, Henrico County, and Chesterfield County, plus the Richmond Area Metropolitan Planning Organization on several occasions throughout the development of the Draft EIS. DRPT commits to coordinate with the City during final design, after funding becomes available and a construction schedule is established, for work within the City.

17. The location of the proposed wye has been modified since the Draft EIS, in coordination with FRA, DRPT, CSXT, and the City of Richmond. Section 4.4.6 of the Final EIS summarizes the location of the proposed wye, with further details on the rationale provided in Appendix J of the Final EIS.



City of Richmond Comments:

- The City of Richmond requests a detailed cost breakdown of the individual projects in the Richmond area. We understand that detailed costs will be available as part of the next phase of the NEPA, FEIS, process and 30% design/engineering. 18
- The City of Richmond recommends phasing of improvements in order to allow for incremental improvements that will allow for an increase of service for the Regional and Interstate Corridor (SEHSR) trains to travel through Richmond from North Carolina and Norfolk, VA, and finally the Long Distance trains (i.e. Carolinian) in a phased manner. 19
- The City of Richmond will work proactively with the DRPT, VDOT, FHWA, FRA and the RRTPO in order to utilize available resources in a manner that will allow for incremental improvements that will enable the Regional and Interstate Corridor (SEHSR) trains to service Main Street Station in the near future.

- **Flood Wall Modification – Third Track** - The Flood Wall will require a modification to accommodate the third track south of Main Street Station and across the James River. In order to accommodate the third track, a modification to the flood wall will be required.

City of Richmond Comments:

- The City of Richmond Department of Public Utilities (DPU) requests a full briefing and review of the design and engineering associated with the modifications to the flood wall that will be required to accommodate the third track. 20
- The City of Richmond requests that DRPT provide full coordination with the Corp of Engineers regarding any design and engineering associated with the modifications to the flood wall. 21
- Funding and resources will be required to continue the evaluation of environmental impacts and to accommodate all analysis required by the City of Richmond DPU and the Corp of Engineers. 22

Separated Grade Crossings:

- **Commerce Rd Crossing (MP S 2.99)**
  The plans currently show the proposed crossing to be relocated near 2207 Commerce Rd. The relocated crossing would be a grade separated structure such that the bridge structure is perpendicular to the existing tracks. The relocated portion of Commerce Rd would connect to Bellemeade Road near 2108 Bellemeade Road. The existing portions of Commerce Rd would terminate at the existing rail crossing, and would still provide access to existing businesses. Further, the relocated crossing and street appears to displace several businesses on the proposed corridor. Also, the proposed alternative does not address the crossing of Goodes Creek and other waterbodies on the proposed alignment.

City of Richmond Comments:

- The City is developing pedestrian facilities on Commerce Road. These pedestrian facilities appear to be absent from the proposed crossing. 23
- This grade crossing must be coordinated with the City of Richmond's Department of Economic Development and its economic development strategy for the area. 24

4

CITY OF RICHMOND (continued)

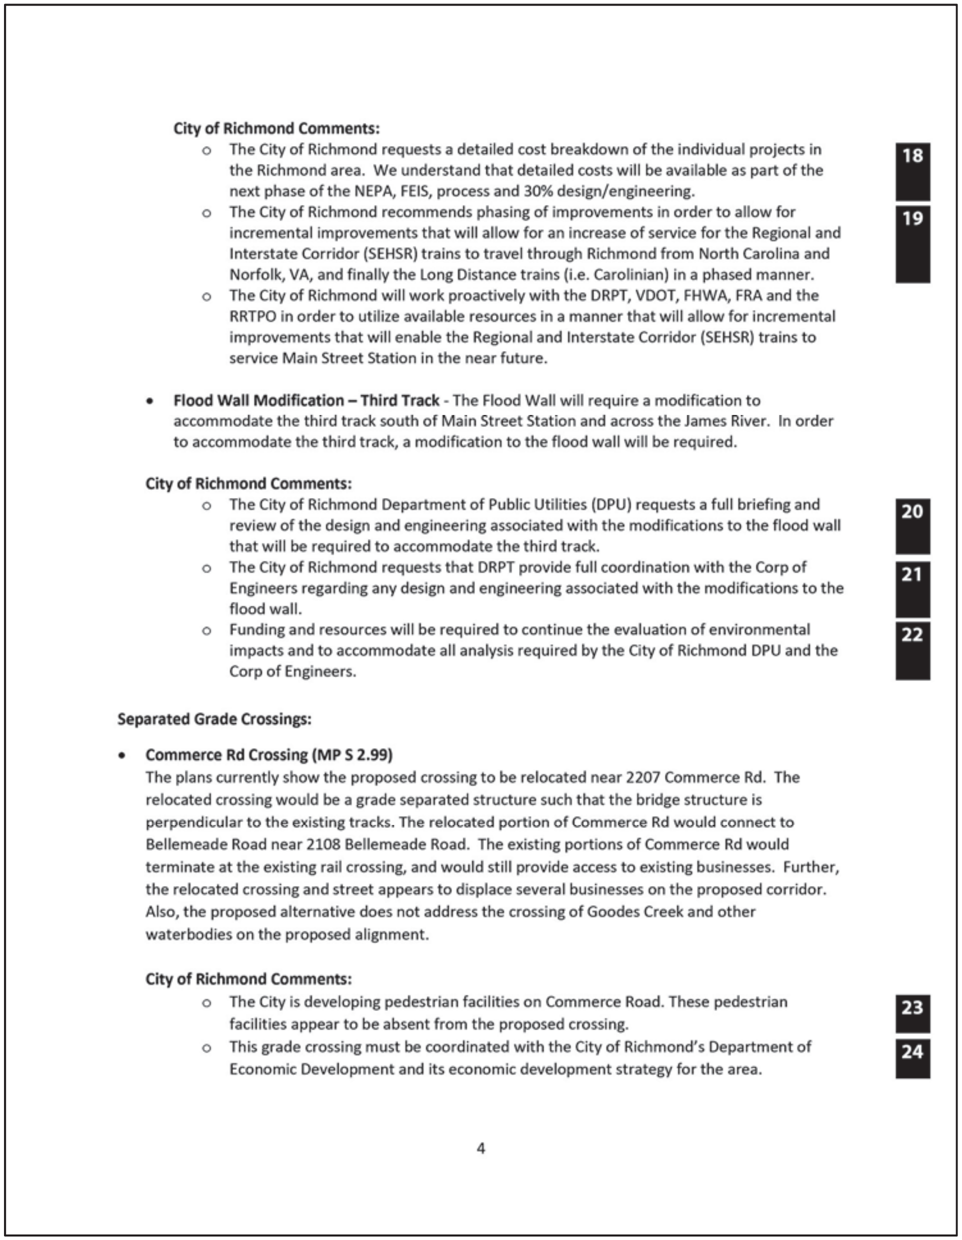
18. and 19. As the City states, more detailed cost estimates will be developed at each phase of the Project. DRPT anticipates that the DC2RVA Project will be implemented incrementally, as funding becomes available, for phasing improvements and for increasing passenger rail service. While a Project implementation plan would be developed as part of the Corridor Service Development Plan for the Project, final design and construction of would be contingent on funding availability. Refer to Chapter 7 of the Final EIS for full summary of these future steps of the Project.

20. DRPT has met with the City on several occasions throughout the development of the Draft and Final EIS. DRPT commits to coordinate with the City during final design, after funding becomes available and a construction schedule is established, for work within the City.

21. DRPT has met and coordinated with the US Army Corps of Engineers (USACE) on several occasions throughout the development of the Draft and Final EIS. DRPT commits to coordinate with the City and other stakeholders during final design, after funding becomes available and a construction schedule is established, for work within the City. Coordination with the USACE would be undertaken, as appropriate, during the final design phase should any modifications to the flood wall become necessary.

22. Funding for the current DC2RVA Tier II EIS is from an FRA grant with the Commonwealth of Virginia and CSXT railroad providing the local match to the grant. At the conclusion of the Tier II EIS process, the goal is to have successfully completed the NEPA process to meet federal requirements and qualify for federal funding for the DC2RVA Project. DRPT anticipates the DC2RVA Project will be implemented incrementally, as funding becomes available. A construction timeline will be established as funding becomes available in the future.

(Responses are continued on next page)



City of Richmond Comments:

- The City of Richmond requests a detailed cost breakdown of the individual projects in the Richmond area. We understand that detailed costs will be available as part of the next phase of the NEPA, FEIS, process and 30% design/engineering. 18
- The City of Richmond recommends phasing of improvements in order to allow for incremental improvements that will allow for an increase of service for the Regional and Interstate Corridor (SEHSR) trains to travel through Richmond from North Carolina and Norfolk, VA, and finally the Long Distance trains (i.e. Carolinian) in a phased manner. 19
- The City of Richmond will work proactively with the DRPT, VDOT, FHWA, FRA and the RRTPO in order to utilize available resources in a manner that will allow for incremental improvements that will enable the Regional and Interstate Corridor (SEHSR) trains to service Main Street Station in the near future.

- **Flood Wall Modification – Third Track** - The Flood Wall will require a modification to accommodate the third track south of Main Street Station and across the James River. In order to accommodate the third track, a modification to the flood wall will be required.

City of Richmond Comments:

- The City of Richmond Department of Public Utilities (DPU) requests a full briefing and review of the design and engineering associated with the modifications to the flood wall that will be required to accommodate the third track. 20
- The City of Richmond requests that DRPT provide full coordination with the Corp of Engineers regarding any design and engineering associated with the modifications to the flood wall. 21
- Funding and resources will be required to continue the evaluation of environmental impacts and to accommodate all analysis required by the City of Richmond DPU and the Corp of Engineers. 22

Separated Grade Crossings:

- **Commerce Rd Crossing (MP S 2.99)**

  The plans currently show the proposed crossing to be relocated near 2207 Commerce Rd. The relocated crossing would be a grade separated structure such that the bridge structure is perpendicular to the existing tracks. The relocated portion of Commerce Rd would connect to Bellemeade Road near 2108 Bellemeade Road. The existing portions of Commerce Rd would terminate at the existing rail crossing, and would still provide access to existing businesses. Further, the relocated crossing and street appears to displace several businesses on the proposed corridor. Also, the proposed alternative does not address the crossing of Goodes Creek and other waterbodies on the proposed alignment.

City of Richmond Comments:

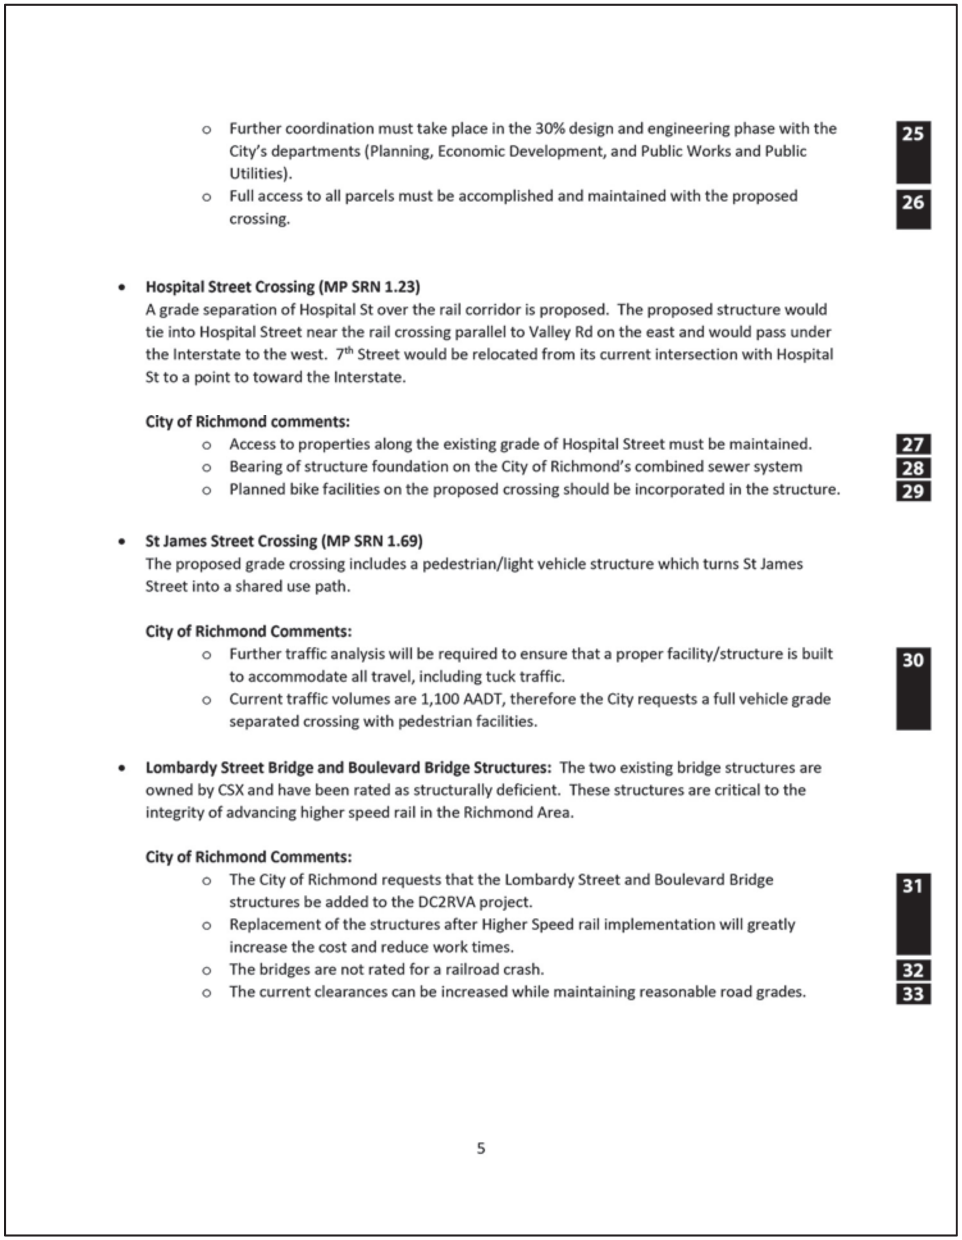
- The City is developing pedestrian facilities on Commerce Road. These pedestrian facilities appear to be absent from the proposed crossing. 23
- This grade crossing must be coordinated with the City of Richmond's Department of Economic Development and its economic development strategy for the area. 24

4

CITY OF RICHMOND (continued)

23. DRPT has met with the City on several occasions throughout the development of the Draft and Final EIS. Conceptual designs of Commerce Road do not preclude the development of pedestrian facilities. Pedestrian facilities may be incorporated in the final design of Commerce Road. DRPT commits to coordinate with the City during final design, after funding becomes available and a construction schedule is established, for work within the City.

24. and 25. DRPT commits to coordinate with the City during final design, after funding becomes available and a construction schedule is established, for work within the City.



- Further coordination must take place in the 30% design and engineering phase with the City's departments (Planning, Economic Development, and Public Works and Public Utilities). 25
- Full access to all parcels must be accomplished and maintained with the proposed crossing. 26

- **Hospital Street Crossing (MP SRN 1.23)**
  A grade separation of Hospital St over the rail corridor is proposed. The proposed structure would tie into Hospital Street near the rail crossing parallel to Valley Rd on the east and would pass under the Interstate to the west. 7th Street would be relocated from its current intersection with Hospital St to a point to toward the Interstate.

  City of Richmond comments:
  - Access to properties along the existing grade of Hospital Street must be maintained. 27
  - Bearing of structure foundation on the City of Richmond's combined sewer system 28
  - Planned bike facilities on the proposed crossing should be incorporated in the structure. 29

- **St James Street Crossing (MP SRN 1.69)**
  The proposed grade crossing includes a pedestrian/light vehicle structure which turns St James Street into a shared use path.

  City of Richmond Comments:
  - Further traffic analysis will be required to ensure that a proper facility/structure is built to accommodate all travel, including tuck traffic. 30
  - Current traffic volumes are 1,100 AADT, therefore the City requests a full vehicle grade separated crossing with pedestrian facilities.

- **Lombardy Street Bridge and Boulevard Bridge Structures:** The two existing bridge structures are owned by CSX and have been rated as structurally deficient. These structures are critical to the integrity of advancing higher speed rail in the Richmond Area.

  City of Richmond Comments:
  - The City of Richmond requests that the Lombardy Street and Boulevard Bridge structures be added to the DC2RVA project. 31
  - Replacement of the structures after Higher Speed rail implementation will greatly increase the cost and reduce work times.
  - The bridges are not rated for a railroad crash. 32
  - The current clearances can be increased while maintaining reasonable road grades. 33

5

CITY OF RICHMOND (continued)

(Response to comment 25 on previous page)

26. and 27. The conceptual designs for improvements considered in the Draft and Final EIS include maintaining parcel access or indicating impacts to parcels where access is realigned, relocated, or removed. Additional review of parcel access will be performed for all recommended grade separations, including studies for frontage roads, as part of the final design, after funding becomes available and this phase of the incremental improvements are scheduled.

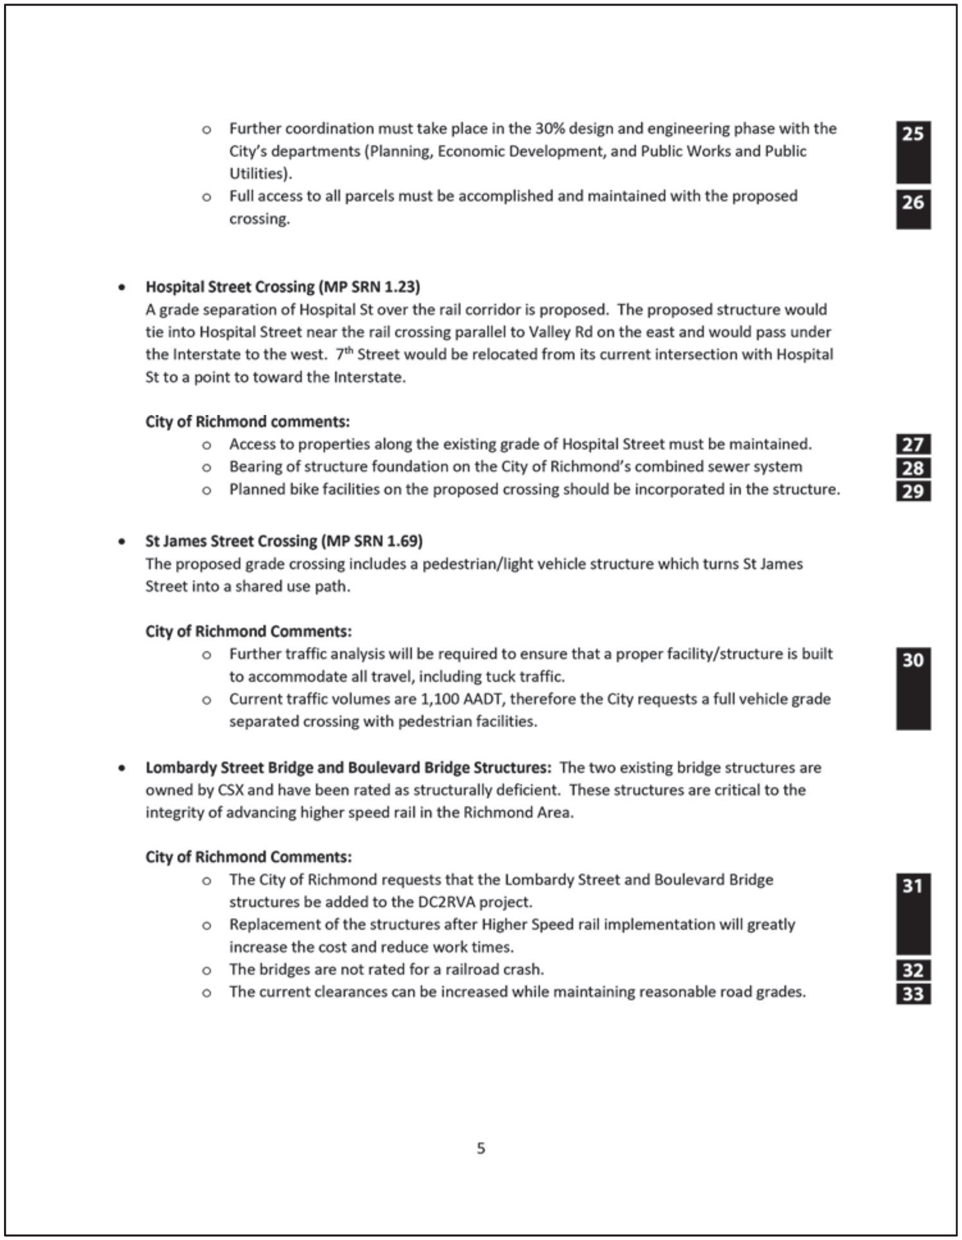
28. Additional subsurface investigations and structural analyses will be performed for all proposed structures as part of final design, after funding becomes available and incremental improvements are scheduled.

29. The Preferred Alternative maintains existing bicycle and pedestrian facilities (provided in-kind, i.e., to the same level of existing treatment) throughout the Project corridor. The conceptual design of Hospital Street was based on existing conditions at the time of development, and do not preclude future development of bike facilities. Bike facilities may be incorporated in the final design of Hospital Street, after funding becomes available and this phase of the incremental improvements are scheduled.

30. The Draft EIS includes a traffic queuing analysis at all grade crossings (see Section 4.15.2); the analyses provided are sufficient for the level of conceptual engineering level completed for environmental analysis. FHWA criteria indicates that the crossing does not meet the threshold to consider a grade separation. Additionally, there is an existing grade separation within one mile of this crossing with good connectivity through the existing roadway network, making this crossing a candidate for closure. DC2RVA conceptual designs do not preclude the construction of a full grade separation with automobile, pedestrian, and truck access by the City.

    Additional review of traffic data to update traffic conditions will be performed for at-grade crossings, including those recommended for grade separation, as part of final design after funding becomes available and a construction schedule can be established.

(Responses are continued on next page)



- Further coordination must take place in the 30% design and engineering phase with the City's departments (Planning, Economic Development, and Public Works and Public Utilities). 25
- Full access to all parcels must be accomplished and maintained with the proposed crossing. 26

- **Hospital Street Crossing (MP SRN 1.23)**
  A grade separation of Hospital St over the rail corridor is proposed. The proposed structure would tie into Hospital Street near the rail crossing parallel to Valley Rd on the east and would pass under the Interstate to the west. 7th Street would be relocated from its current intersection with Hospital St to a point to toward the Interstate.

  City of Richmond comments:
  - Access to properties along the existing grade of Hospital Street must be maintained. 27
  - Bearing of structure foundation on the City of Richmond's combined sewer system 28
  - Planned bike facilities on the proposed crossing should be incorporated in the structure. 29

- **St James Street Crossing (MP SRN 1.69)**
  The proposed grade crossing includes a pedestrian/light vehicle structure which turns St James Street into a shared use path.

  City of Richmond Comments:
  - Further traffic analysis will be required to ensure that a proper facility/structure is built to accommodate all travel, including tuck traffic. 30
  - Current traffic volumes are 1,100 AADT, therefore the City requests a full vehicle grade separated crossing with pedestrian facilities.

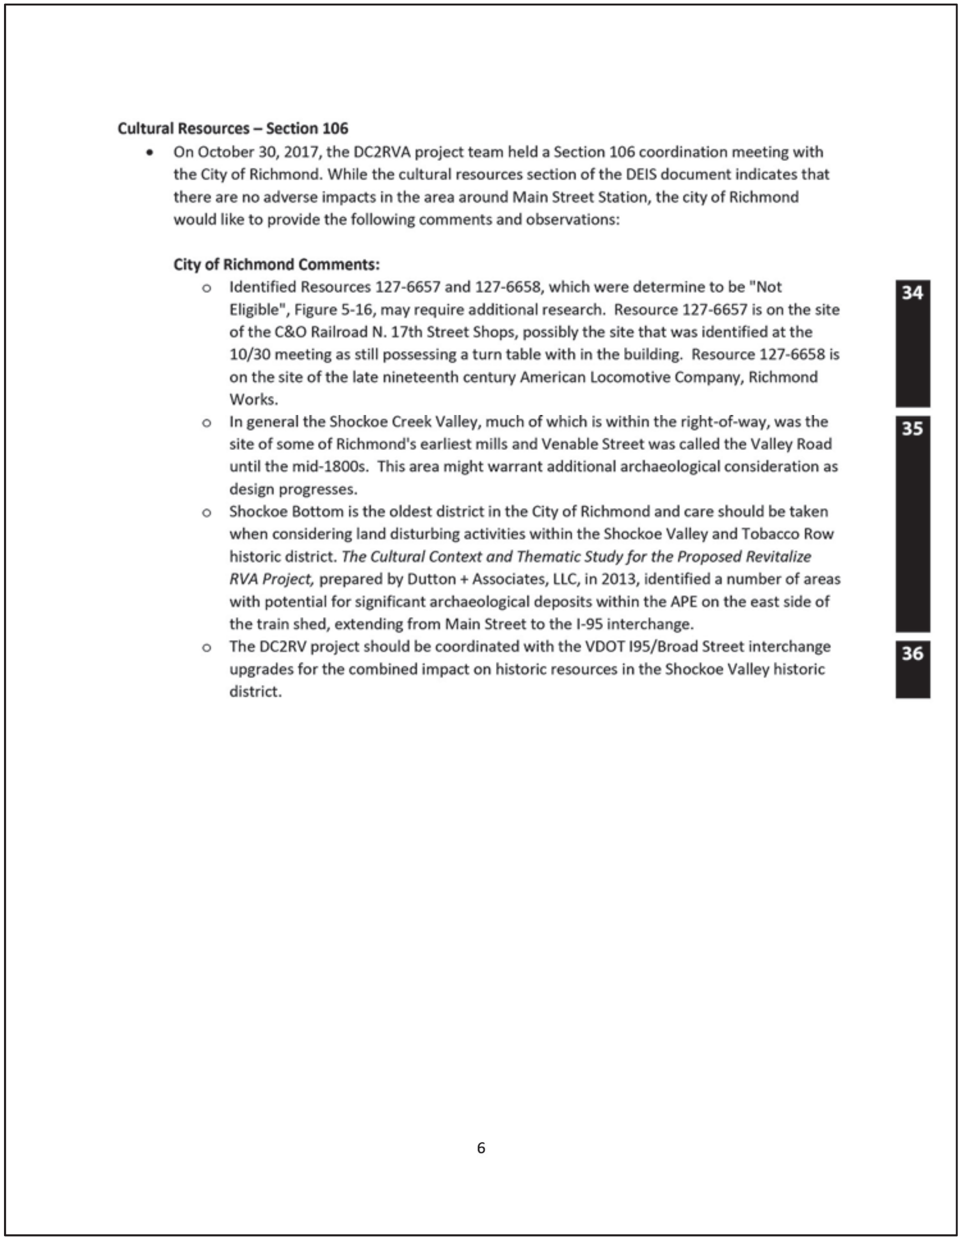
- **Lombardy Street Bridge and Boulevard Bridge Structures:** The two existing bridge structures are owned by CSX and have been rated as structurally deficient. These structures are critical to the integrity of advancing higher speed rail in the Richmond Area.

  City of Richmond Comments:
  - The City of Richmond requests that the Lombardy Street and Boulevard Bridge structures be added to the DC2RVA project. 31
  - Replacement of the structures after Higher Speed rail implementation will greatly increase the cost and reduce work times.
  - The bridges are not rated for a railroad crash. 32
  - The current clearances can be increased while maintaining reasonable road grades. 33

5

CITY OF RICHMOND (continued)

31. to 33. DRPT considered existing track clearances and requirements for protecting existing structures where proposed improvements do not impact the existing infrastructure. The existing Lombardy Street Bridge and Boulevard Bridge do not require rehabilitation or replacement to fulfill the Purpose and Need for the DC2RVA Project. DC2RVA conceptual designs do not preclude rehabilitation or replacement of the Lombardy Street Bridge or the Boulevard Bridge by the City or CSXT. The need for crash walls to protect existing bridge piers will be determined during final design.



Cultural Resources – Section 106

- On October 30, 2017, the DC2RVA project team held a Section 106 coordination meeting with the City of Richmond. While the cultural resources section of the DEIS document indicates that there are no adverse impacts in the area around Main Street Station, the city of Richmond would like to provide the following comments and observations:

  City of Richmond Comments:

  34
  - Identified Resources 127-6657 and 127-6658, which were determine to be "Not Eligible", Figure 5-16, may require additional research. Resource 127-6657 is on the site of the C&O Railroad N. 17th Street Shops, possibly the site that was identified at the 10/30 meeting as still possessing a turn table with in the building. Resource 127-6658 is on the site of the late nineteenth century American Locomotive Company, Richmond Works.

  35
  - In general the Shockoe Creek Valley, much of which is within the right-of-way, was the site of some of Richmond's earliest mills and Venable Street was called the Valley Road until the mid-1800s. This area might warrant additional archaeological consideration as design progresses.
  - Shockoe Bottom is the oldest district in the City of Richmond and care should be taken when considering land disturbing activities within the Shockoe Valley and Tobacco Row historic district. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project*, prepared by Dutton + Associates, LLC, in 2013, identified a number of areas with potential for significant archaeological deposits within the APE on the east side of the train shed, extending from Main Street to the I-95 interchange.

  36
  - The DC2RV project should be coordinated with the VDOT I95/Broad Street interchange upgrades for the combined impact on historic resources in the Shockoe Valley historic district.

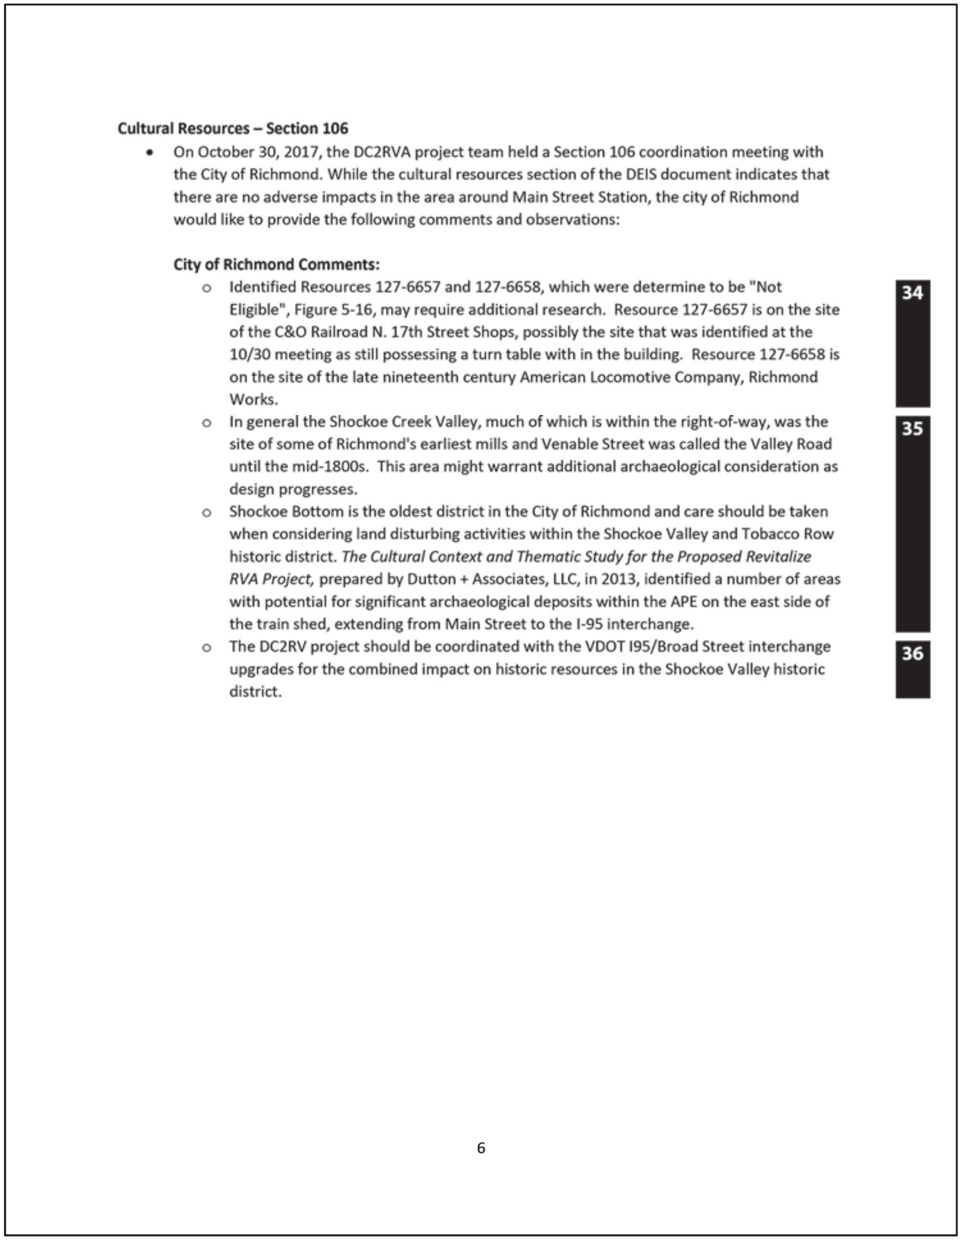
6

CITY OF RICHMOND (continued)

34. The Project requires compliance with the National Historic Preservation Act of 1966, requiring that project plans take into consideration potential effects on historic properties. Resources 127-6657 and 127-6658 were preliminarily recorded during architectural studies associated with the Project in 2016, and the building was the subject of additional investigation in 2017/2018. In addition, the parcel was studied for potentially intact archaeological remains in 2018. Upon review of the data, DHR determined that these resources are not individually eligible for the National Register of Historic Places. As such, they are not listed as a historic property in the Final EIS. However, properties were noted during the planning process, and DRPT removed the need for modifications to this property by eliminating planned construction for a wye in this area; refer to Appendix J of the Final EIS for details on the revised Richmond area turning wye and service yard location that is part of the Preferred Alternative, which is also summarized in Section 4.6 of the Final EIS. Technical reports detailing cultural resource studies can be found in Appendix D of the Final EIS.

35. The FRA and DRPT fully understand the sensitivity and significance of the Shockoe Bottom area, and in particular the area slated for the Memorial Park. DRPT reviewed prior studies that recorded and evaluated archaeological and architectural properties in this area have been ongoing since 2006. Resources in Shockoe Bottom including the proposed Memorial Park area are discussed in Chapters 3, 5, and 6 of the Final EIS and within several reports in Appendix D (cultural resource technical reports). Throughout the studies and agency and public consultation, the historic places located in this area have been taken into consideration during Project planning. This includes Lumpkins Jail/Devil's Half Acre and the Burial Ground, among others. The Project does not impact the known boundaries of these sites. At the request of several consulting parties, Lumpkins Jail site was added to the list of historic properties. The DHR determined that the Project will have no adverse effect on the site as no impacts will occur as part of the Project. The history of Shockoe Bottom and the slave trade are included in the Section 106 Draft Memorandum of Agreement to mitigate adverse effects on historic properties (Appendix K of the Final EIS).

(Responses are continued on next page)



Cultural Resources – Section 106

- On October 30, 2017, the DC2RVA project team held a Section 106 coordination meeting with the City of Richmond. While the cultural resources section of the DEIS document indicates that there are no adverse impacts in the area around Main Street Station, the city of Richmond would like to provide the following comments and observations:

  City of Richmond Comments:

  - 34 Identified Resources 127-6657 and 127-6658, which were determine to be "Not Eligible", Figure 5-16, may require additional research. Resource 127-6657 is on the site of the C&O Railroad N. 17th Street Shops, possibly the site that was identified at the 10/30 meeting as still possessing a turn table with in the building. Resource 127-6658 is on the site of the late nineteenth century American Locomotive Company, Richmond Works.
  - 35 In general the Shockoe Creek Valley, much of which is within the right-of-way, was the site of some of Richmond's earliest mills and Venable Street was called the Valley Road until the mid-1800s. This area might warrant additional archaeological consideration as design progresses.
  - Shockoe Bottom is the oldest district in the City of Richmond and care should be taken when considering land disturbing activities within the Shockoe Valley and Tobacco Row historic district. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project*, prepared by Dutton + Associates, LLC, in 2013, identified a number of areas with potential for significant archaeological deposits within the APE on the east side of the train shed, extending from Main Street to the I-95 interchange.
  - 36 The DC2RV project should be coordinated with the VDOT I95/Broad Street interchange upgrades for the combined impact on historic resources in the Shockoe Valley historic district.

6

CITY OF RICHMOND (continued)

36. Potential construction elements of the I-95/Broad Street Interchange Improvements and VDOT studies on historic resources in Shockoe Valley associated with this undertaking were taken into consideration as background data and to assure consistent methodologies and resource evaluations. Chapter 3 of the Final EIS includes the results of the background review completed as part of the Project including details on the Shockoe Bottom area and I-95 street improvements as they relate to the current Project area. Additionally, the referenced project has been added to the indirect and cumulative effects section, both in terms of potential impacts on land use and historic properties; refer to Section 5.20 of the Final EIS.

    DRPT has defined the scope of improvements proposed for the DC2RVA Project, including Main Street Station, to include the minimum amount of infrastructure required to deliver the service improvements proposed under the Project. This includes the removal of the proposed parking structure at Main Street Station in the Final EIS; instead of the parking structure, DRPT will work with the City to develop a parking plan for Main Street Station that is incorporated into City plans for Shockoe Bottom and Downtown Richmond.

APPENDIX B4

RESPONSES TO SECTION 106 CONSULTING PARTY COMMENTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix B4

RESPONSES TO SECTION 106 CONSULTING PARTY COMMENTS

This Appendix Section B4 provides detailed responses to Section 106 Consulting Party letters, presented in the below order:

- National Trust for Historic Preservation B-306
- Civil War Trust B-313
- Hanover County Historical Commission B-315
- Historic Richmond B-317
- City of Alexandria – Planning and Zoning B-324

Additionally, Appendix E of the Final EIS details the comments and coordination for the Section 106 process.

Re: Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement & Section 4(f) Evaluation

Dear Federal Railroad Administration and DC2RVA Project Team:

On behalf of the National Trust for Historic Preservation, this letter serves as a comment on the Tier II Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation for the Washington, D.C. to Richmond High Speed Rail Project (Project).

The National Trust is a privately funded nonprofit organization chartered by Congress in 1949 to facilitate public participation in the preservation of our nation's heritage, and to further the historic preservation policy of the United States. *See* 54 U.S.C. § 312102(a). With more than one million members and supporters around the country, the National Trust works to protect significant historic sites and to advocate historic preservation as a fundamental value in programs and policies at all levels of government. In addition, the National Trust has been designated by Congress as a member of the Advisory Council on Historic Preservation, which is responsible for working with federal agencies to implement compliance with Section 106 of the National Historic Preservation Act (NHPA). *Id.* §§ 304101(8), 304108(a). In this case, the National Trust is participating as a consulting party in connection with the agency's ongoing review under Section 106. The National Trust also has a long-standing track record of advocacy to enforce compliance with Section 4(f) of the Department of Transportation Act, 49 U.S.C. § 303(c).

Potential Impacts to Shockoe Bottom are Not Adequately Considered. 1

For several years, the National Trust has been advocating for greater public awareness, commemoration and protection of the Shockoe Bottom area in Richmond. Shockoe Bottom was the center of Richmond's slave trade and played a pivotal role during the peak years of the nation's interstate slave trade. Slave-trade auction houses, offices, slave jails, and residences of the most prominent slave traders were scattered throughout Shockoe Bottom, a creek valley flowing into the James River. Today much of Shockoe Bottom has been razed and paved over. Nevertheless, archaeological remains endure, and Shockoe Bottom should be memorialized as sacred ground associated with suffering, injustice, and resistance to slavery.

NATIONAL TRUST FOR HISTORIC PRESERVATION

Subsequent to NTHP's submittal of comments on the Draft EIS in this November 7, 2017 letter, DRPT met with the NTHP for three additional meetings as well as corresponded through over a dozen emails to share additional data on the Preferred Alternative, final list of historic properties, Project effect, and development of the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS). The NTHP submitted a formal reply letter to the final roster of historic properties and effect on July 20, 2018, and the DRPT sent a written reply to their concerns on September 4, 2018. Additional comments were subsequently received from the NTHP on December 21, 2018. Copies of all correspondence including letters and minutes of meetings are provided in Appendix E of the Final EIS.

1. Alternative 6F (Full Service Staples Mill Road/Main Street Station) has been selected as the Preferred Alternative in Area 6 through Richmond. As defined in Section 4.3.6 of the Final EIS, the Preferred Alternative in Area 6 provides full service to two stations in Richmond, one serving downtown Richmond at Main Street Station and a second serving suburban Richmond at Staples Mill Road. As the downtown station, Main Street Station will provide convenient access to the residential, commercial and recreational resources in Richmond's Central Business District (CBD) and historic Shockoe Bottom. Sections 5.13 and 6.4 of the Final EIS discusses the potential impacts to registered historic sites near Main Street Station, including the aforementioned resources in Shockoe Bottom. Chapter 4.3.6 of the Final EIS further describes the infrastructure improvements proposed near Main Street Station in Area 6. Through review and investigation of historic records as reflected in Section 3.1, consultation with numerous agencies and consulting parties, and in comments received from the public and your agency, DRPT has reduced the facilities proposed for construction at Main Street Station to the minimum infrastructure necessary to deliver the service proposed in the DC2RVA Project. This includes a reduction in the design length of the platforms on the east and west sides of the station to remain south of East Broad Street, and to the minimum width feasible to support the forecasted level of ridership and services provided at the station.

Re: Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement & Section 4(f) Evaluation

Dear Federal Railroad Administration and DC2RVA Project Team:

On behalf of the National Trust for Historic Preservation, this letter serves as a comment on the Tier II Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation for the Washington, D.C. to Richmond High Speed Rail Project (Project).

The National Trust is a privately funded nonprofit organization chartered by Congress in 1949 to facilitate public participation in the preservation of our nation's heritage, and to further the historic preservation policy of the United States. *See* 54 U.S.C. § 312102(a). With more than one million members and supporters around the country, the National Trust works to protect significant historic sites and to advocate historic preservation as a fundamental value in programs and policies at all levels of government. In addition, the National Trust has been designated by Congress as a member of the Advisory Council on Historic Preservation, which is responsible for working with federal agencies to implement compliance with Section 106 of the National Historic Preservation Act (NHPA). *Id.* §§ 304101(8), 304108(a). In this case, the National Trust is participating as a consulting party in connection with the agency's ongoing review under Section 106. The National Trust also has a long-standing track record of advocacy to enforce compliance with Section 4(f) of the Department of Transportation Act, 49 U.S.C. § 303(c).

Potential Impacts to Shockoe Bottom are Not Adequately Considered. 1

For several years, the National Trust has been advocating for greater public awareness, commemoration and protection of the Shockoe Bottom area in Richmond. Shockoe Bottom was the center of Richmond's slave trade and played a pivotal role during the peak years of the nation's interstate slave trade. Slave-trade auction houses, offices, slave jails, and residences of the most prominent slave traders were scattered throughout Shockoe Bottom, a creek valley flowing into the James River. Today much of Shockoe Bottom has been razed and paved over. Nevertheless, archaeological remains endure, and Shockoe Bottom should be memorialized as sacred ground associated with suffering, injustice, and resistance to slavery.

The Watergate Office Building 2600 Virginia Avenue NW Suite 1100 Washington, DC 20037
E law@savingplaces.org P 202.588.6035 F 202.588.6272 www.PreservationNation.org

NATIONAL TRUST FOR HISTORIC PRESERVATION (continued)

The provision of a two-station alternative in Richmond allows for a distribution of ridership, parking and automobile traffic among the stations. Therefore, this minimizes the infrastructure required and potential impacts associated with Main Street Station. Additionally, DRPT has relocated the proposed construction of a maintenance and servicing facility at the former CSXT Brown Street Yard and a turning wye track at Hospital Street to a site near Bellwood Yard south of Richmond (see Section 4.3 and Appendix J of the Final EIS for additional detail) and removed a multistory parking deck in this area.

Throughout the Project and as highlighted by the avoidance efforts described above, FRA and DRPT understand the sensitivity and cultural significance of the Shockoe Bottom area. The Project, as currently designed, does not impact the known boundaries of identified archaeological sites. Based on consulting party feedback, the Lumpkins Jail/Devil's Half Acre site and the Graveyard for Free People of Color and Slaves, located north of Shockoe Bottom, have been added to the list of historic properties and carefully evaluated for impacts. FRA determined, and the DHR concurred, that the Project would have no adverse effect on these sites; however, FRA and DRPT recognize that unrecorded archaeological sites likely exist in the general Project vicinity and all efforts were made to minimize the limits of disturbance in this area due to the high probability for such unrecorded sites. Based on evaluations of historic properties in this area, resources associated with the antebellum occupation of this area, including the slave trade, are being avoided. However, several postbellum sites, buildings, and districts will be impacted. This includes sites 44HE1095, 44HE1097, and 44HE1098 (turn of the century warehouses). DRPT is fully committed to conducting full archaeological studies on these three sites in any area where disturbance cannot be avoided. In addition, three above-ground historic properties will be affected by the Project: the Shockoe Valley and Tobacco Row Historic District, Main Street Station, and the Seaboard Air Line Railroad.

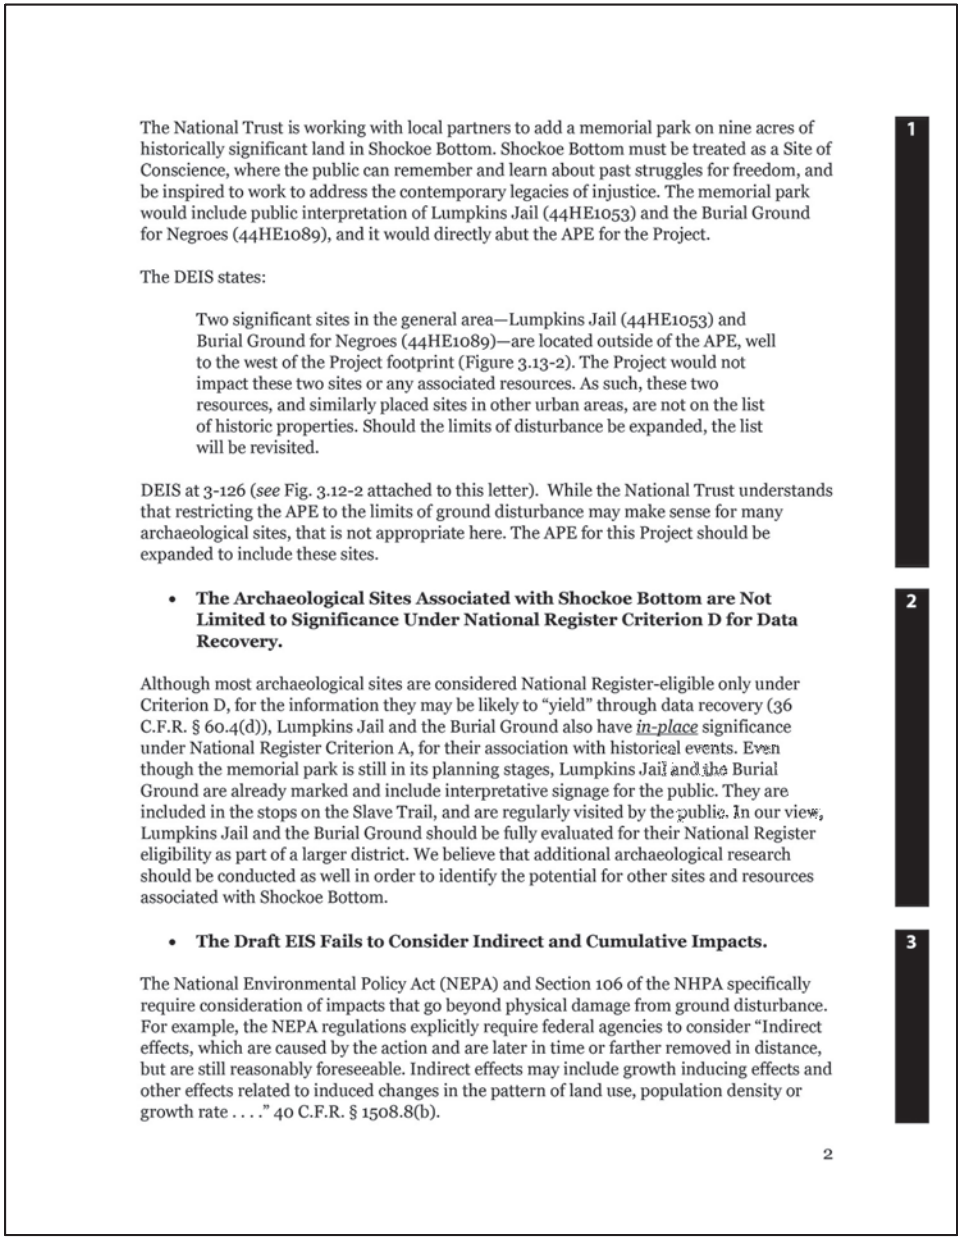
E law@savingplaces.org P 202.588.6035 F 202.588.6272 www.PreservationNation.org

NATIONAL TRUST FOR HISTORIC PRESERVATION (continued)

Although the Project will result in an impact to these resources, the use of the area and station as a railroad terminal is consistent with the use of the existing and former passenger rail facilities at this location, thus further preserving the historic context in the area. Section 3.1.4 of the Final EIS provides an expanded discussion of the Main Street Station / Shockoe Bottom area, including comments and concerns from the Draft EIS related to historic context, history of the area, summary of previous cultural studies and summary of all work to-date including ongoing work since the issuance of the Draft EIS, the avoidance analysis, and future studies.

Regarding archaeological study outside of the limits of disturbance, however, DRPT has discussed the issue extensively with DHR and ACHP, and they haves concluded that preservation in place is the priority, as archaeology can be a destructive science. As such, general archaeological protocol to avoid archaeological deposits will be employed during Project implementation, and areas outside of the limits of disturbance will not be the subject of additional excavation as part of the identification and evaluation studies. The Section 106 Draft Memorandum of Agreement (MOA), which is Appendix K of the Final EIS, outlining stipulations to mitigate adverse effects, has been developed based on feedback from consulting parties, property owners, and involved agencies and include a roster of tasks to be completed on all adversely affected resources, such as public interpretation, additional research, National Register documentation, archaeological data recovery, and more. This includes adverse effects to the Shockoe Valley and Tobacco Row Historic District and sites associated with the slave trade that are contributing elements to this district, including Lumpkins Jail/Devil's Half Acre.



1 The National Trust is working with local partners to add a memorial park on nine acres of historically significant land in Shockoe Bottom. Shockoe Bottom must be treated as a Site of Conscience, where the public can remember and learn about past struggles for freedom, and be inspired to work to address the contemporary legacies of injustice. The memorial park would include public interpretation of Lumpkins Jail (44HE1053) and the Burial Ground for Negroes (44HE1089), and it would directly abut the APE for the Project.

The DEIS states:

> Two significant sites in the general area—Lumpkins Jail (44HE1053) and Burial Ground for Negroes (44HE1089)—are located outside of the APE, well to the west of the Project footprint (Figure 3.13-2). The Project would not impact these two sites or any associated resources. As such, these two resources, and similarly placed sites in other urban areas, are not on the list of historic properties. Should the limits of disturbance be expanded, the list will be revisited.

DEIS at 3-126 (*see* Fig. 3.12-2 attached to this letter). While the National Trust understands that restricting the APE to the limits of ground disturbance may make sense for many archaeological sites, that is not appropriate here. The APE for this Project should be expanded to include these sites.

2
- **The Archaeological Sites Associated with Shockoe Bottom are Not Limited to Significance Under National Register Criterion D for Data Recovery.**

Although most archaeological sites are considered National Register-eligible only under Criterion D, for the information they may be likely to "yield" through data recovery (36 C.F.R. § 60.4(d)), Lumpkins Jail and the Burial Ground also have *in-place* significance under National Register Criterion A, for their association with historical events. Even though the memorial park is still in its planning stages, Lumpkins Jail and the Burial Ground are already marked and include interpretative signage for the public. They are included in the stops on the Slave Trail, and are regularly visited by the public. In our view, Lumpkins Jail and the Burial Ground should be fully evaluated for their National Register eligibility as part of a larger district. We believe that additional archaeological research should be conducted as well in order to identify the potential for other sites and resources associated with Shockoe Bottom.

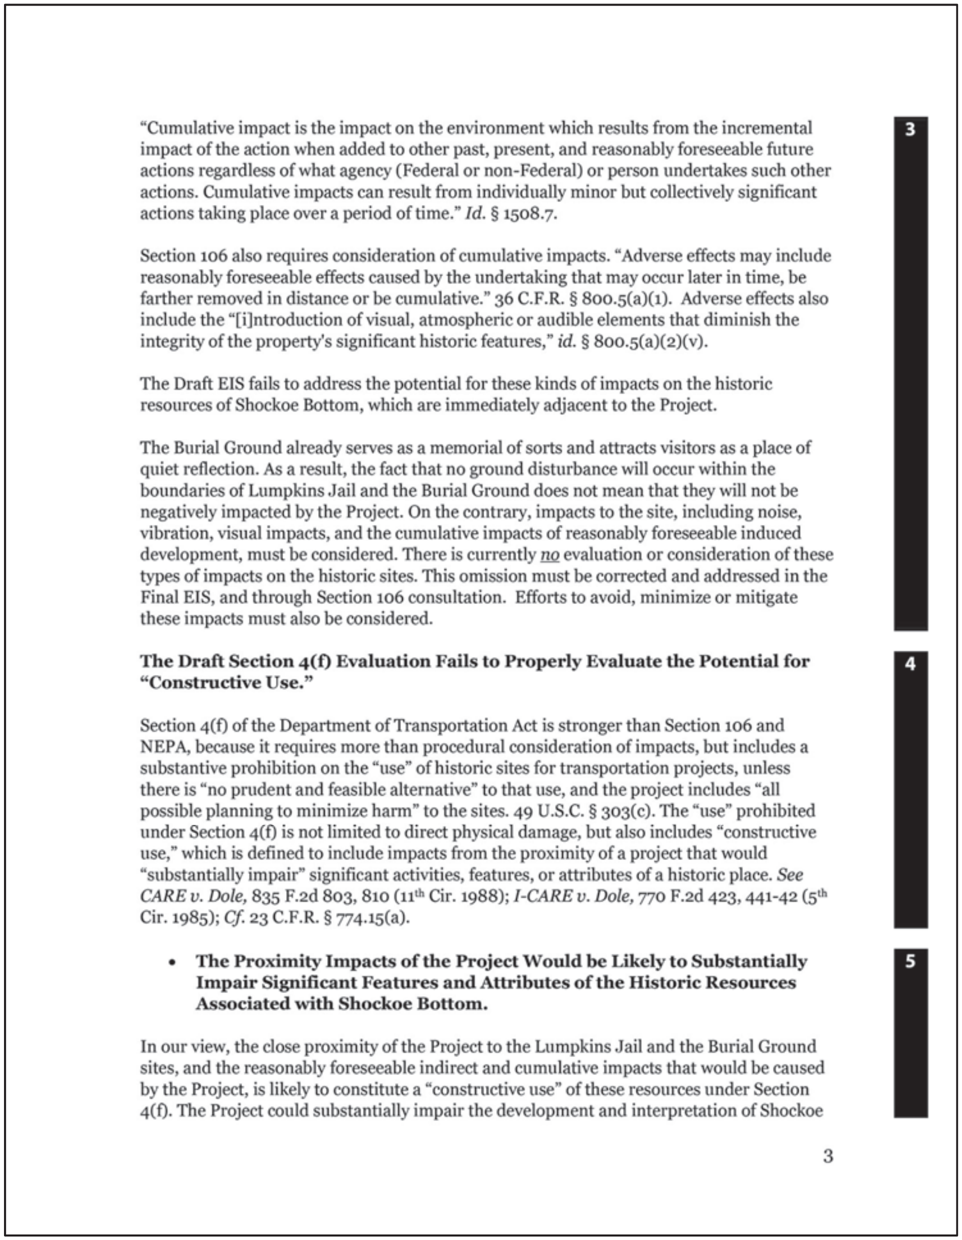
3
- **The Draft EIS Fails to Consider Indirect and Cumulative Impacts.**

The National Environmental Policy Act (NEPA) and Section 106 of the NHPA specifically require consideration of impacts that go beyond physical damage from ground disturbance. For example, the NEPA regulations explicitly require federal agencies to consider "Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate . . . ." 40 C.F.R. § 1508.8(b).

NATIONAL TRUST FOR HISTORIC PRESERVATION (continued)

(Response to comment 1 on pages B-306 through B-308)

2. DRPT concurs with the National Trust for Historic Preservation's comment and, as mentioned above in DRPT response #1, preservation in place of these resources is paramount. These resources will be avoided during Project construction.
3. Final EIS Section 5.20 addresses indirect and cumulative impacts, including potential impacts on historic properties, from the Preferred Alternative. Data was also distributed to all consulting parties via email and in person meetings (see Appendix E of the Final EIS). Based on comments received from the National Trust and similar comments from others, expanded discussion of potential indirect and cumulative effects on historic resources in Shockoe Bottom is included in Section 3.1 of the Final EIS.



3 "Cumulative impact is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." *Id.* § 1508.7.

Section 106 also requires consideration of cumulative impacts. "Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative." 36 C.F.R. § 800.5(a)(1). Adverse effects also include the "[i]ntroduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features," *id.* § 800.5(a)(2)(v).

The Draft EIS fails to address the potential for these kinds of impacts on the historic resources of Shockoe Bottom, which are immediately adjacent to the Project.

The Burial Ground already serves as a memorial of sorts and attracts visitors as a place of quiet reflection. As a result, the fact that no ground disturbance will occur within the boundaries of Lumpkins Jail and the Burial Ground does not mean that they will not be negatively impacted by the Project. On the contrary, impacts to the site, including noise, vibration, visual impacts, and the cumulative impacts of reasonably foreseeable induced development, must be considered. There is currently *no* evaluation or consideration of these types of impacts on the historic sites. This omission must be corrected and addressed in the Final EIS, and through Section 106 consultation. Efforts to avoid, minimize or mitigate these impacts must also be considered.

4 **The Draft Section 4(f) Evaluation Fails to Properly Evaluate the Potential for "Constructive Use."**

Section 4(f) of the Department of Transportation Act is stronger than Section 106 and NEPA, because it requires more than procedural consideration of impacts, but includes a substantive prohibition on the "use" of historic sites for transportation projects, unless there is "no prudent and feasible alternative" to that use, and the project includes "all possible planning to minimize harm" to the sites. 49 U.S.C. § 303(c). The "use" prohibited under Section 4(f) is not limited to direct physical damage, but also includes "constructive use," which is defined to include impacts from the proximity of a project that would "substantially impair" significant activities, features, or attributes of a historic place. *See CARE v. Dole*, 835 F.2d 803, 810 (11th Cir. 1988); *I-CARE v. Dole*, 770 F.2d 423, 441-42 (5th Cir. 1985); *Cf.* 23 C.F.R. § 774.15(a).

5
- **The Proximity Impacts of the Project Would be Likely to Substantially Impair Significant Features and Attributes of the Historic Resources Associated with Shockoe Bottom.**

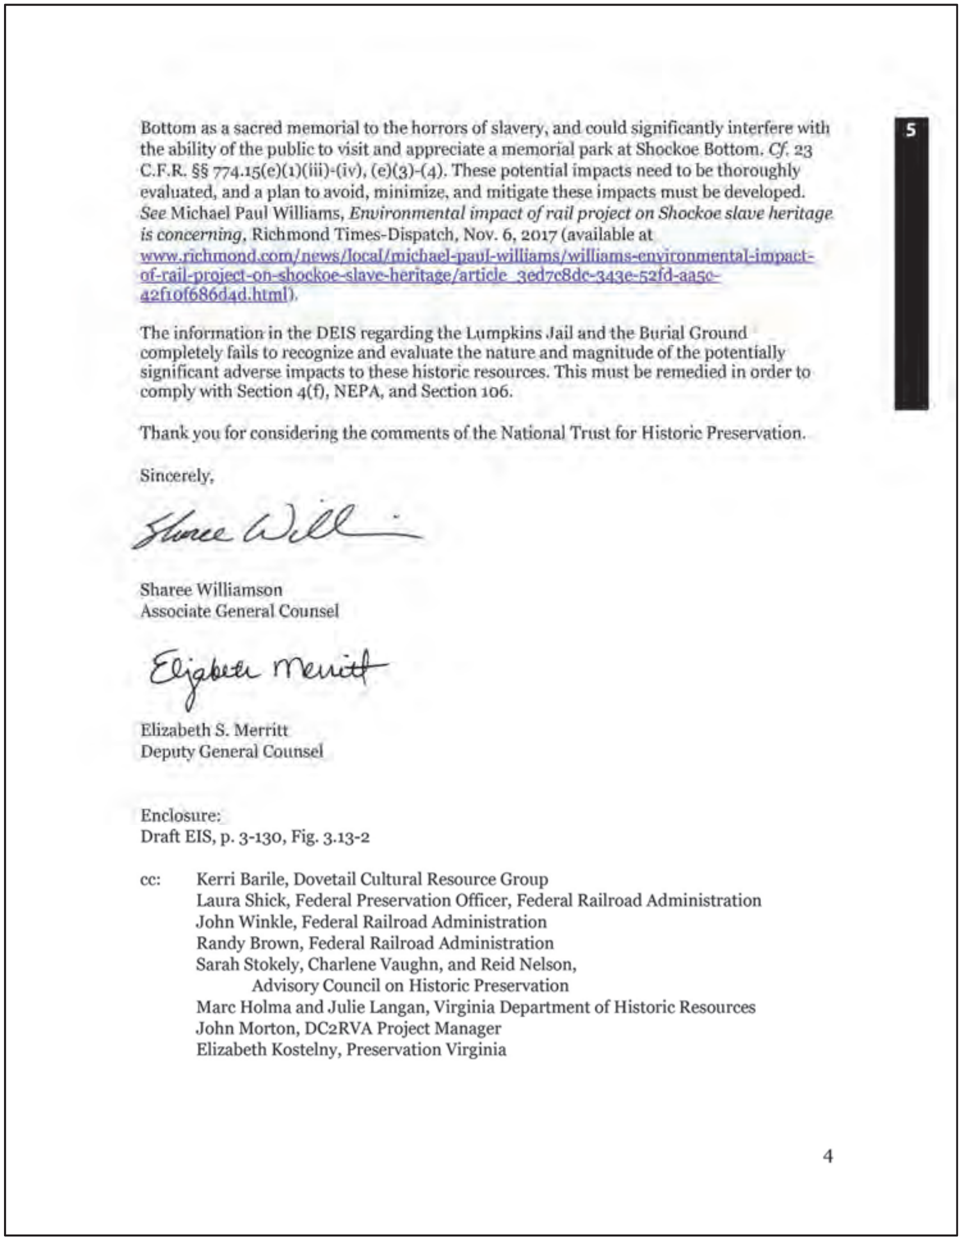
In our view, the close proximity of the Project to the Lumpkins Jail and the Burial Ground sites, and the reasonably foreseeable indirect and cumulative impacts that would be caused by the Project, is likely to constitute a "constructive use" of these resources under Section 4(f). The Project could substantially impair the development and interpretation of Shockoe

NATIONAL TRUST FOR HISTORIC PRESERVATION (continued)

(Response to comment 3 on previous page)

4. An expanded discussion of potential impacts to Shockoe Bottom historic properties is included in Section 3.1 of the Final EIS, including an evaluation of the applicability of constructive use under Section 4(f).

5. DRPT conducted additional review of prior studies on this area to ensure that the history is known prior to obtaining final effect determinations; as stated in DRPT response #1. Expanded discussion of the Main Street Station / Shockoe Bottom area, including details on all historical research conducted to date is presented in Final EIS Section 3.1.4. In addition, an examination on 4(f) use is presented in Final EIS Chapter 6.5 through 6.7. There are no constructive uses associated with the DC2RVA Project Final Section 4(f) Evaluation.



Bottom as a sacred memorial to the horrors of slavery, and could significantly interfere with the ability of the public to visit and appreciate a memorial park at Shockoe Bottom. *Cf.* 23 C.F.R. §§ 774.15(e)(1)(iii)-(iv), (e)(3)-(4). These potential impacts need to be thoroughly evaluated, and a plan to avoid, minimize, and mitigate these impacts must be developed. *See* Michael Paul Williams, *Environmental impact of rail project on Shockoe slave heritage is concerning*, Richmond Times-Dispatch, Nov. 6, 2017 (available at www.richmond.com/news/local/michael-paul-williams/williams-environmental-impact-of-rail-project-on-shockoe-slave-heritage/article_3ed7c8dc-343e-52fd-aa5c-42f10f686d4d.html).

The information in the DEIS regarding the Lumpkins Jail and the Burial Ground completely fails to recognize and evaluate the nature and magnitude of the potentially significant adverse impacts to these historic resources. This must be remedied in order to comply with Section 4(f), NEPA, and Section 106.

5

Thank you for considering the comments of the National Trust for Historic Preservation.

Sincerely,

Emily Stock
Manager of Rail Planning
Virginia Department of Rail and Public Transportation
600 East Main Street
Suite 2102
Richmond, VA 23219

Dear Ms. Stock:

I am writing on behalf of the Civil War Trust ("the Trust"), the nation's premier nonprofit organization devoted to the preservation of America's hallowed battlegrounds. Although primarily focused on the protection of Civil War battlefields, through its Campaign 1776 initiative, the Trust also seeks to save the battlefields connected to the Revolutionary War and War of 1812. To date, the Trust has preserved more than 47,000 acres of battlefield land in 24 states, including 24,615 acres in the Commonwealth of Virginia.

In comments which the Trust sent to your attention on June 22, 2015, we commended the team behind the Washington, D.C., to Richmond Southeast High Speed Rail (DC2RVA) project for the appropriately careful way in which potential impacts to battlefields and related resources were being considered from the project's outset. In the formal description of the project's four-stage alternatives development screening process, for instance, prominently noted at the time was the fact that the first stage of the process would identify "fatal flaws" in proposed rail alignment options — with adverse effects to "historic resources listed in or eligible for the National Register of Historic Places" as well as "federal, state or local parks" specifically cited as examples of such flaws.

Recently, the Trust received a copy of the DC2RVA Tier II Draft Environmental Impact Statement (Draft EIS), and — on October 24, 2017 — representatives of the Trust had the opportunity to connect directly with Dr. Kerri Barile and members of the DC2RVA team writ large for a detailed breakdown of the findings of the Draft EIS centered specifically on battlefield resources. We were pleased to find that, as succinctly stated on pg. 4-155 of the Draft EIS, "Based on preliminary dialogues with DHR [the Virginia Department of Historic Resources], the Project would have No Adverse Effect on any of the 11 battlefields within the APE [Area of Potential Effects]."

Equally as encouraging to the Trust was, and is, the forward-looking commitment to maintaining the historic integrity of Virginia's battlefields that the DC2RVA team reaffirms clearly within the Draft EIS, also on pg. 4-155: "As Project plans are confirmed, the work would be evaluated to assure that character-defining features of the battlefields in general, and contributing elements specifically, are not altered or diminished during the Project." This is consistent with the commitment made by the DC2RVA team during the project's public debut. 1

1156 15th Street NW, Suite 900, Washington, DC 20005 | Phone 202-367-1861 | Fax 202-367-1865 | info@civilwar.org

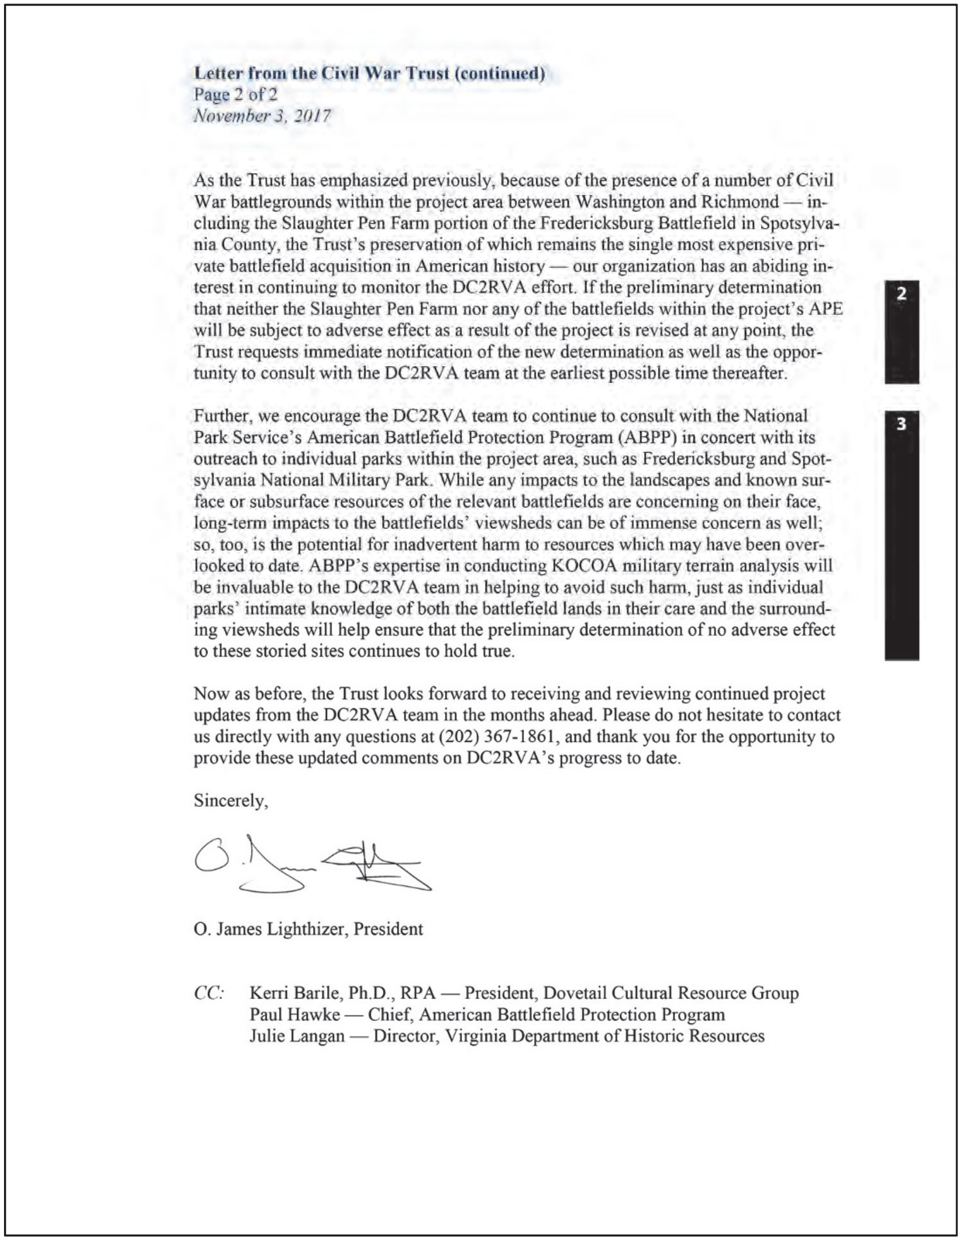
Civilwar.org

CIVIL WAR TRUST

1. DRPT confirms that by selecting a Preferred Alternative that generally remains within the existing CSXT right-of-way through Central Virginia, the Project will not alter or diminish the character-defining features of the battlefields in general and contributing elements specifically.



Letter from the Civil War Trust (continued)
Page 2 of 2
November 3, 2017

2 As the Trust has emphasized previously, because of the presence of a number of Civil War battlegrounds within the project area between Washington and Richmond — including the Slaughter Pen Farm portion of the Fredericksburg Battlefield in Spotsylvania County, the Trust's preservation of which remains the single most expensive private battlefield acquisition in American history — our organization has an abiding interest in continuing to monitor the DC2RVA effort. If the preliminary determination that neither the Slaughter Pen Farm nor any of the battlefields within the project's APE will be subject to adverse effect as a result of the project is revised at any point, the Trust requests immediate notification of the new determination as well as the opportunity to consult with the DC2RVA team at the earliest possible time thereafter.

3 Further, we encourage the DC2RVA team to continue to consult with the National Park Service's American Battlefield Protection Program (ABPP) in concert with its outreach to individual parks within the project area, such as Fredericksburg and Spotsylvania National Military Park. While any impacts to the landscapes and known surface or subsurface resources of the relevant battlefields are concerning on their face, long-term impacts to the battlefields' viewsheds can be of immense concern as well; so, too, is the potential for inadvertent harm to resources which may have been overlooked to date. ABPP's expertise in conducting KOCOA military terrain analysis will be invaluable to the DC2RVA team in helping to avoid such harm, just as individual parks' intimate knowledge of both the battlefield lands in their care and the surrounding viewsheds will help ensure that the preliminary determination of no adverse effect to these storied sites continues to hold true.

Now as before, the Trust looks forward to receiving and reviewing continued project updates from the DC2RVA team in the months ahead. Please do not hesitate to contact us directly with any questions at (202) 367-1861, and thank you for the opportunity to provide these updated comments on DC2RVA's progress to date.

Sincerely,

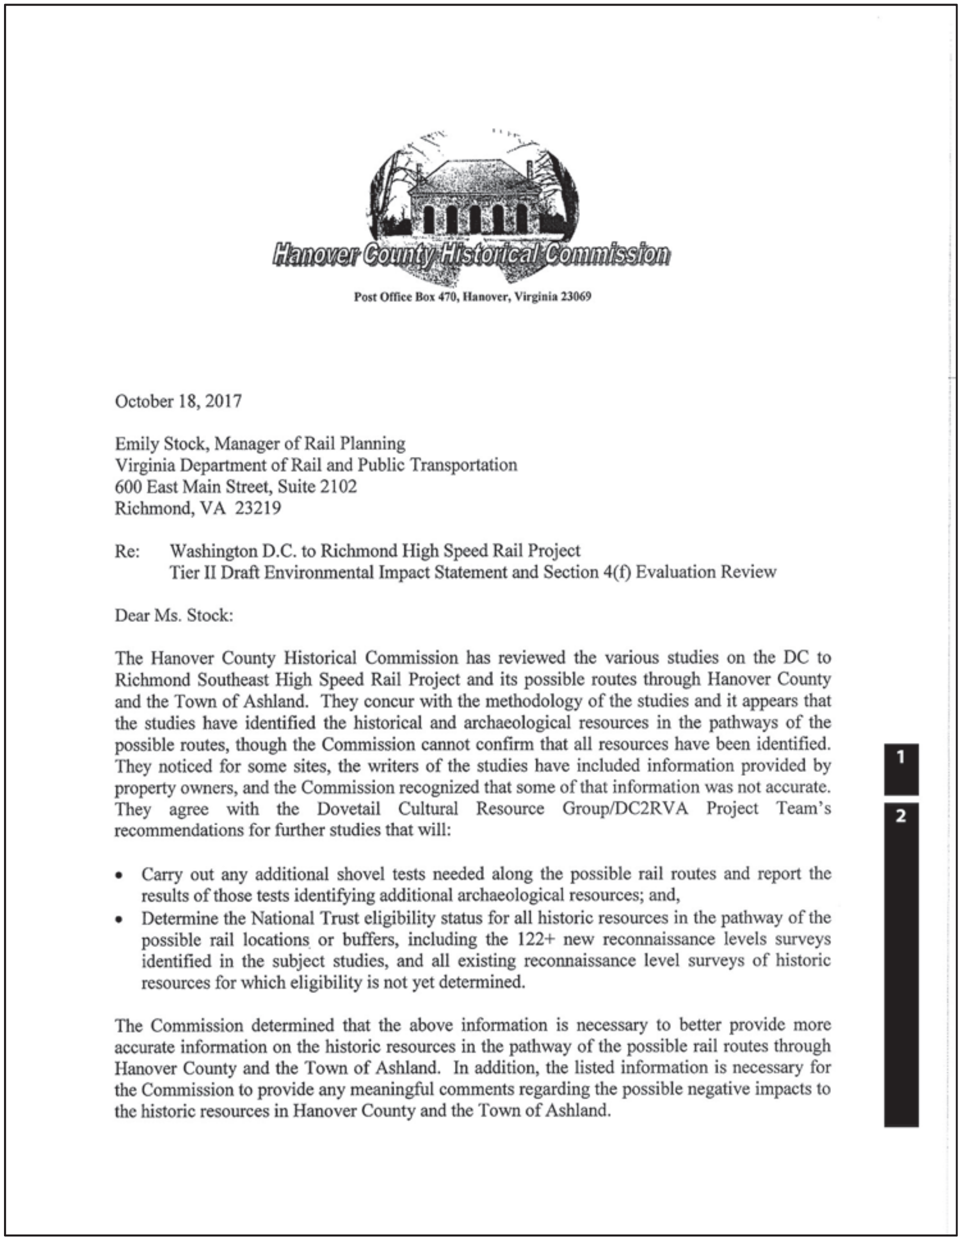
O. James Lighthizer, President

CC: Kerri Barile, Ph.D., RPA — President, Dovetail Cultural Resource Group
Paul Hawke — Chief, American Battlefield Protection Program
Julie Langan — Director, Virginia Department of Historic Resources

CIVIL WAR TRUST (continued)

2. DRPT is committed to an open and continual dialogue with all consulting parties, including the National Park Service's American Battlefield Protection Program ABPP and the Civil War Trust, during the entire Project process. This includes final design, after incremental improvements are scheduled and funding is established. Modifications to the list of historic properties and effect determinations have been disseminated upon receipt, followed by additional meetings and dialogues on the ensuing results.

3. DRPT will continue its ongoing dialogues with all consulting parties, including the ABPP and Fredericksburg and Spotsylvania National Military Park (FSNMP), to assure that all historic properties are thoroughly considered during final design in a manner consistent with DHR guidelines and Section 106 of the National Historic Preservation Act. At a meeting with DRPT on February 13, 2018, the DHR determined that KOCOA analysis is not needed to determine Project Section 106 effects.



Hanover County Historical Commission

Post Office Box 470, Hanover, Virginia 23069

October 18, 2017

Emily Stock, Manager of Rail Planning
Virginia Department of Rail and Public Transportation
600 East Main Street, Suite 2102
Richmond, VA 23219

Re: Washington D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation Review

Dear Ms. Stock:

The Hanover County Historical Commission has reviewed the various studies on the DC to Richmond Southeast High Speed Rail Project and its possible routes through Hanover County and the Town of Ashland. They concur with the methodology of the studies and it appears that the studies have identified the historical and archaeological resources in the pathways of the possible routes, though the Commission cannot confirm that all resources have been identified. 1 They noticed for some sites, the writers of the studies have included information provided by property owners, and the Commission recognized that some of that information was not accurate. 2 They agree with the Dovetail Cultural Resource Group/DC2RVA Project Team's recommendations for further studies that will:

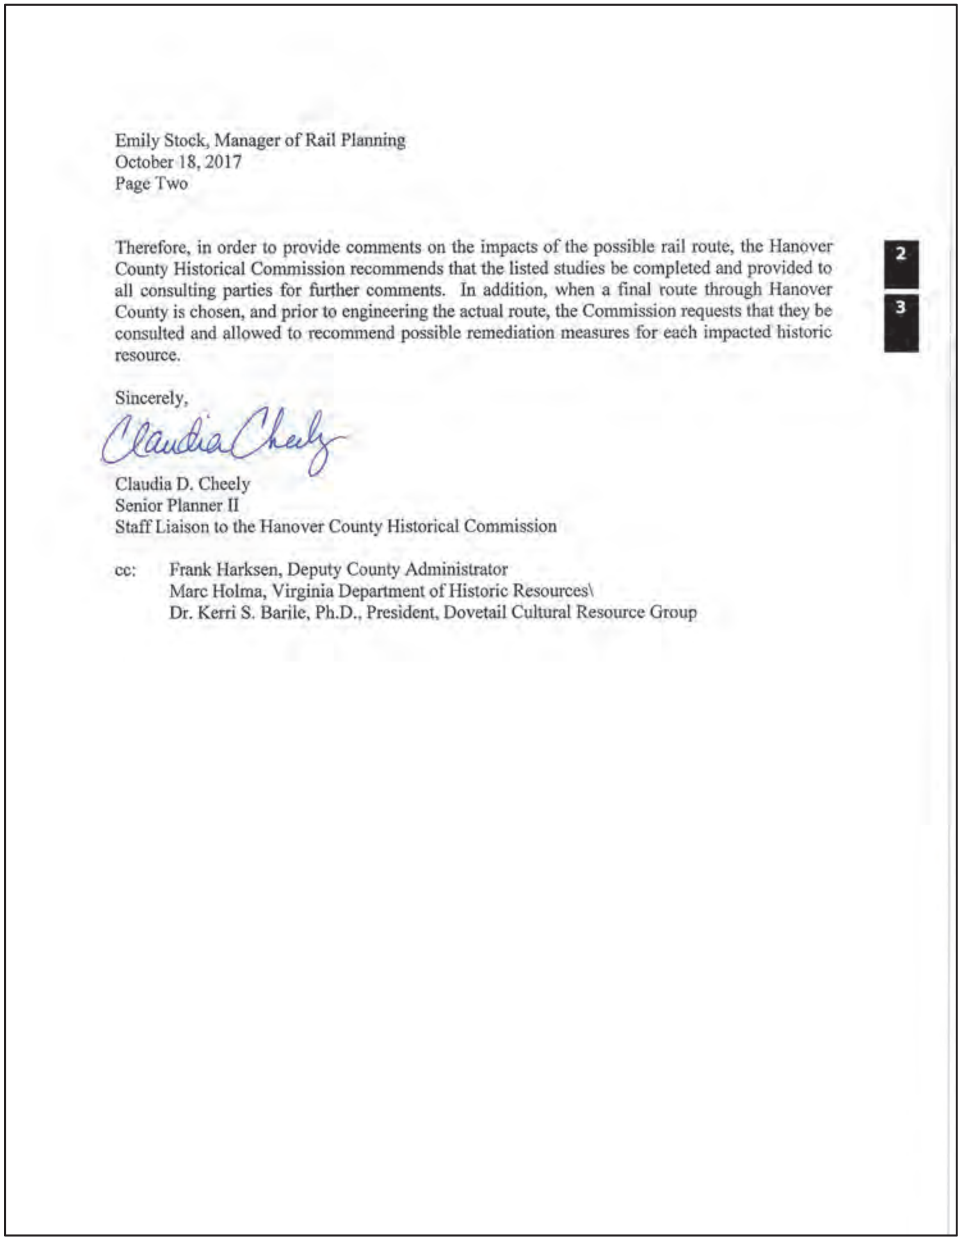
- Carry out any additional shovel tests needed along the possible rail routes and report the results of those tests identifying additional archaeological resources; and,
- Determine the National Trust eligibility status for all historic resources in the pathway of the possible rail locations or buffers, including the 122+ new reconnaissance levels surveys identified in the subject studies, and all existing reconnaissance level surveys of historic resources for which eligibility is not yet determined.

The Commission determined that the above information is necessary to better provide more accurate information on the historic resources in the pathway of the possible rail routes through Hanover County and the Town of Ashland. In addition, the listed information is necessary for the Commission to provide any meaningful comments regarding the possible negative impacts to the historic resources in Hanover County and the Town of Ashland.

HANOVER COUNTY HISTORICAL COMMISSION

1. and 2. DRPT conducted additional studies, including an archaeological survey, architectural survey, and an intensive-level architectural study along with all applicable archival research and contextual reviews, prior to the Final EIS, based on the Commonwealth Transportation Board's recommendation of the Preferred Alternative. Appendix D of the Final EIS presents the resultant updated cultural resources reports. The additional studies included obtaining eligibility determinations for all buildings, districts, objects, structures, and sites within the Project Area of Potential Effects. All work complied with Section 106 of the National Historic Preservation Act and studies were coordinated with the County and the Department of Historic Resources (DHR). Information on any resource deemed a historic property was shared with the Hanover County Historical Commission to verify that character-defining features and notable contextual elements were included as applicable. The Final EIS defines Alternative 5A (Maintain Two Tracks through Town) as the Preferred Alternative in Area 5 through Ashland. Alternative 5A provides the railroad and roadway infrastructure required to support the railroad operations proposed in the DC2RVA Project. As presented in Section 5.13 of the Final EIS, Alternative 5A is expected to affect zero historic properties in downtown Ashland, as no additional infrastructure would be constructed within the Town of Ashland or outside of the CSXT railroad right-of-way through Hanover County. The exception to this includes the construction of new highway-rail grade separations where Vaughan Road (Archie Cannon Drive) and Ashcake Road cross the railroad to the north and south. There are no historic properties in the area of potential effects at the Ashcake Road intersection. There is one historic property at the Vaughan Road (Archie Cannon Drive) intersection: the Berkleytown Historic District. The FRA has determined, and the DHR concurred, that the Project will have an adverse effect and a Section 4(f) use of this resource. Stipulations to mitigate the adverse effect are set forth in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS).

(Responses are continued on next page)



Emily Stock, Manager of Rail Planning
October 18, 2017
Page Two

Therefore, in order to provide comments on the impacts of the possible rail route, the Hanover County Historical Commission recommends that the listed studies be completed and provided to all consulting parties for further comments. In addition, when a final route through Hanover County is chosen, and prior to engineering the actual route, the Commission requests that they be consulted and allowed to recommend possible remediation measures for each impacted historic resource.

Dr. Kerri S. Barile, Ph.D., President, Dovetail Cultural Resource Group

HANOVER COUNTY HISTORICAL COMMISSION (continued)

Outside of Ashland, there are two additional historic properties within Hanover County—the Doswell Historic District and the Doswell Depot and Tower. The FRA has determined that the Project will have an adverse effect and a Section 4(f) use of both resources, and the impacts will be mitigated through the Section 106 process. See Chapter 5 and 6 of the Final EIS for details.

3. All consulting parties to the Section 106 process, including the Hanover County Historical Commission, will continue to be informed of all steps in the cultural resource process, such as stipulations set forth in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS), and upcoming meetings.

RE: Washington, D.C. to Richmond Southeast High Speed Rail Project
Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation
Comments regarding Alternative Area 6: Richmond

Dear Ms. Stock,

Historic Richmond is a consulting party for the Washington, DC to Richmond Southeast High Speed Rail (DC2RVA Project). We thank you for providing the Executive Summary of the Tier II Draft Economic Impact Statement (EIS) along with an electronic copy of the Draft EIS. We are following up on the Draft EIS to provide our preliminary comments regarding the Build Alternatives in Area 6: Richmond. **Historic Richmond supports bringing full service to Main Street Station as presented in Build Alternative 6F, Full Service: Staples Mill Road / Main Street Stations.**

Historic Richmond is a non-profit dedicated to preserving Richmond's distinctive historic character, sparking revitalization, and championing our past and future architectural legacy.

Main Street Station was designed by the Philadelphia firm of Wilson, Harris and Richards. Construction began in 1900 and was completed a year later. It is a Beaux Arts masterpiece, heavily influenced by French Renaissance architecture with a bit of German flair. The building is distinguished by its gold Pompeiian brick, steep terra cotta roof, numerous dormers, an ornate 110-foot clock tower, and terra cotta decoration. The Train Shed to the rear is the largest intact train shed in the United States. In 1970, the Main Street Station was listed on the National Register of Historic Places and, in 1976, it was elevated to a National Historic Landmark.

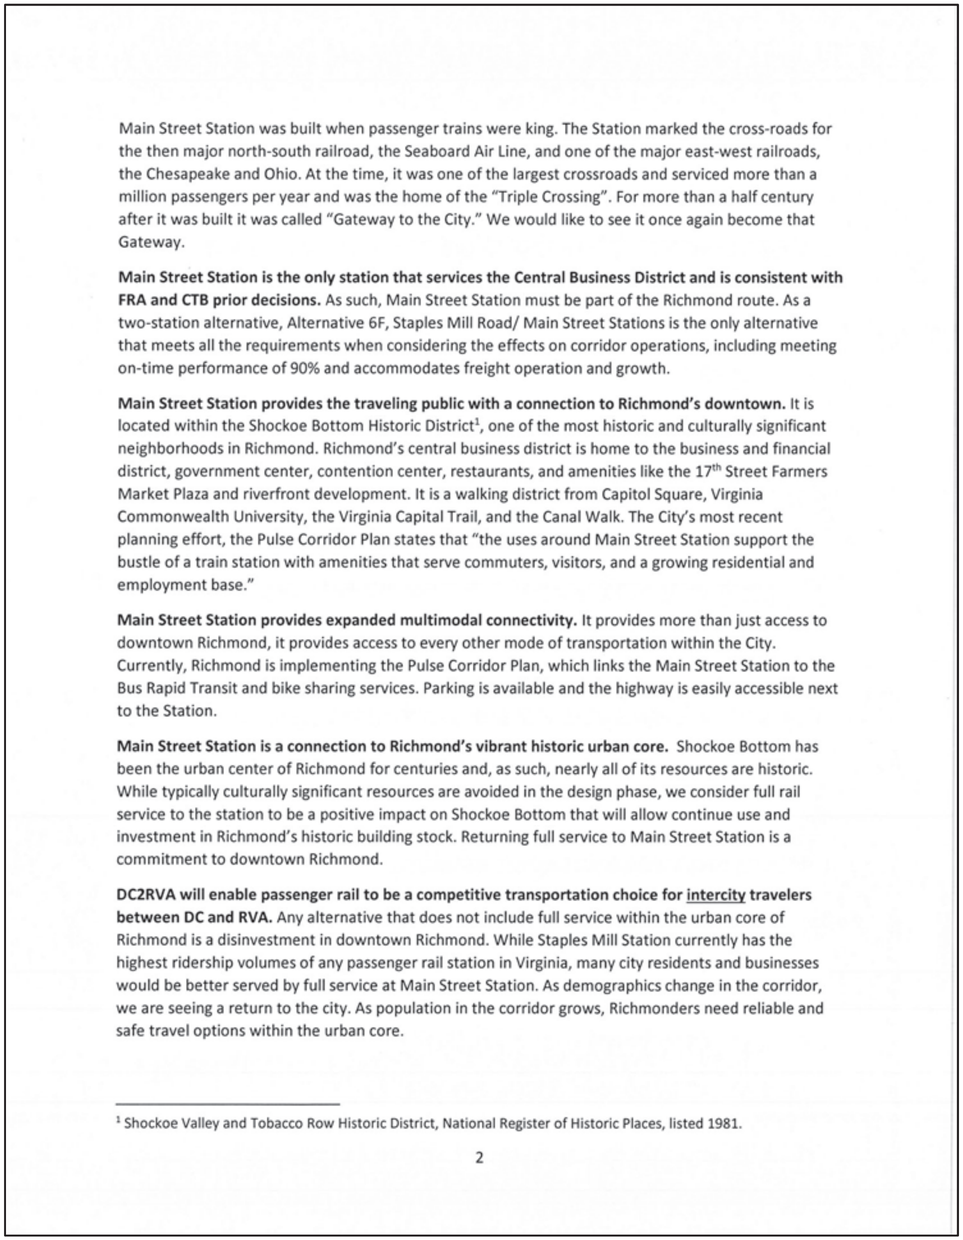
Building on history

HISTORIC RICHMOND

(No comments on this page)

HISTORIC RICHMOND (continued)

(No comments on this page)



Main Street Station was built when passenger trains were king. The Station marked the cross-roads for the then major north-south railroad, the Seaboard Air Line, and one of the major east-west railroads, the Chesapeake and Ohio. At the time, it was one of the largest crossroads and serviced more than a million passengers per year and was the home of the "Triple Crossing". For more than a half century after it was built it was called "Gateway to the City." We would like to see it once again become that Gateway.

Main Street Station is the only station that services the Central Business District and is consistent with FRA and CTB prior decisions. As such, Main Street Station must be part of the Richmond route. As a two-station alternative, Alternative 6F, Staples Mill Road/ Main Street Stations is the only alternative that meets all the requirements when considering the effects on corridor operations, including meeting on-time performance of 90% and accommodates freight operation and growth.

Main Street Station provides the traveling public with a connection to Richmond's downtown. It is located within the Shockoe Bottom Historic District[1], one of the most historic and culturally significant neighborhoods in Richmond. Richmond's central business district is home to the business and financial district, government center, contention center, restaurants, and amenities like the 17th Street Farmers Market Plaza and riverfront development. It is a walking district from Capitol Square, Virginia Commonwealth University, the Virginia Capital Trail, and the Canal Walk. The City's most recent planning effort, the Pulse Corridor Plan states that "the uses around Main Street Station support the bustle of a train station with amenities that serve commuters, visitors, and a growing residential and employment base."

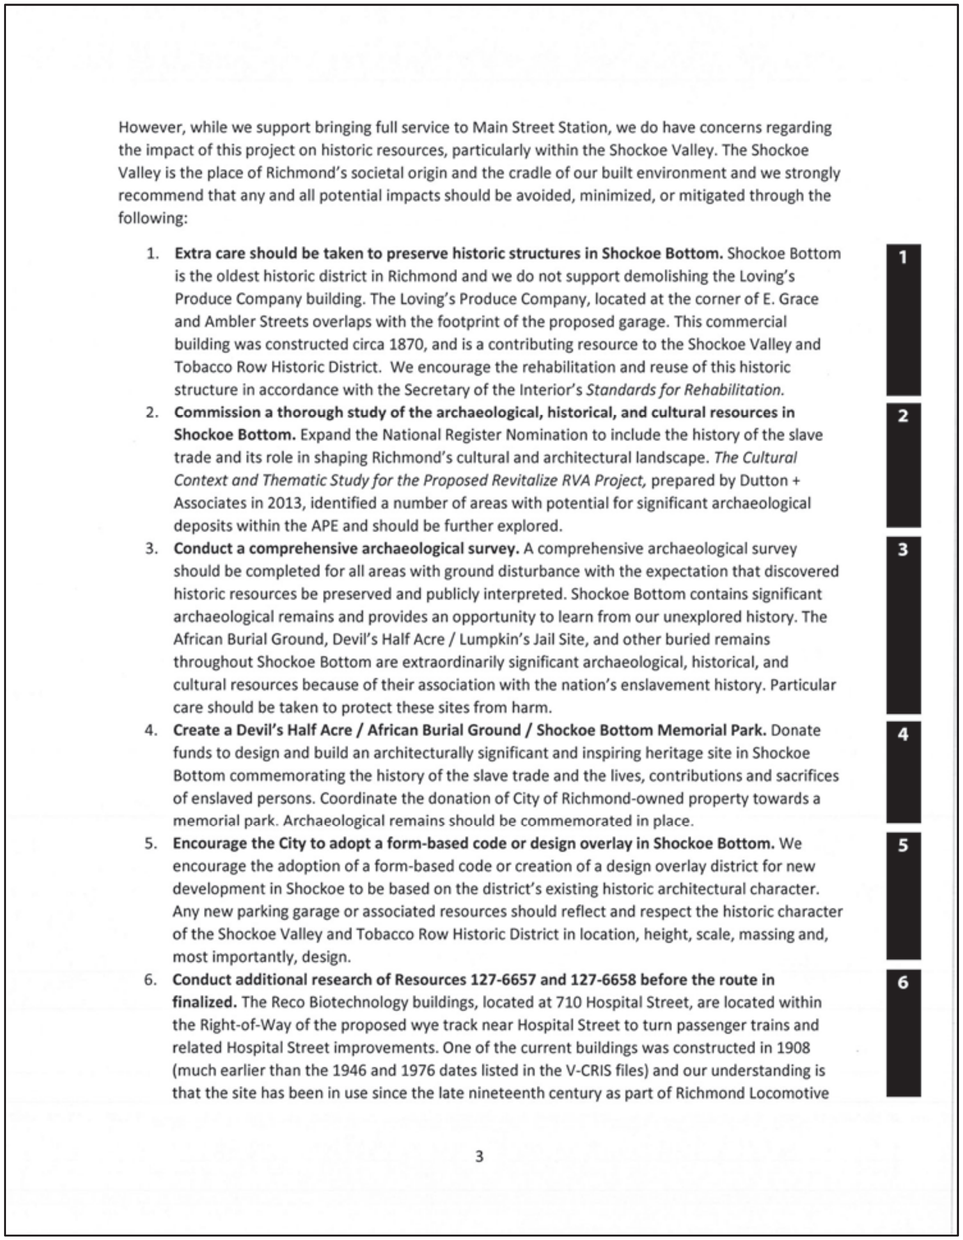
Main Street Station provides expanded multimodal connectivity. It provides more than just access to downtown Richmond, it provides access to every other mode of transportation within the City. Currently, Richmond is implementing the Pulse Corridor Plan, which links the Main Street Station to the Bus Rapid Transit and bike sharing services. Parking is available and the highway is easily accessible next to the Station.

Main Street Station is a connection to Richmond's vibrant historic urban core. Shockoe Bottom has been the urban center of Richmond for centuries and, as such, nearly all of its resources are historic. While typically culturally significant resources are avoided in the design phase, we consider full rail service to the station to be a positive impact on Shockoe Bottom that will allow continue use and investment in Richmond's historic building stock. Returning full service to Main Street Station is a commitment to downtown Richmond.

DC2RVA will enable passenger rail to be a competitive transportation choice for intercity travelers between DC and RVA. Any alternative that does not include full service within the urban core of Richmond is a disinvestment in downtown Richmond. While Staples Mill Station currently has the highest ridership volumes of any passenger rail station in Virginia, many city residents and businesses would be better served by full service at Main Street Station. As demographics change in the corridor, we are seeing a return to the city. As population in the corridor grows, Richmonders need reliable and safe travel options within the urban core.

---

[1] Shockoe Valley and Tobacco Row Historic District, National Register of Historic Places, listed 1981.



However, while we support bringing full service to Main Street Station, we do have concerns regarding the impact of this project on historic resources, particularly within the Shockoe Valley. The Shockoe Valley is the place of Richmond's societal origin and the cradle of our built environment and we strongly recommend that any and all potential impacts should be avoided, minimized, or mitigated through the following:

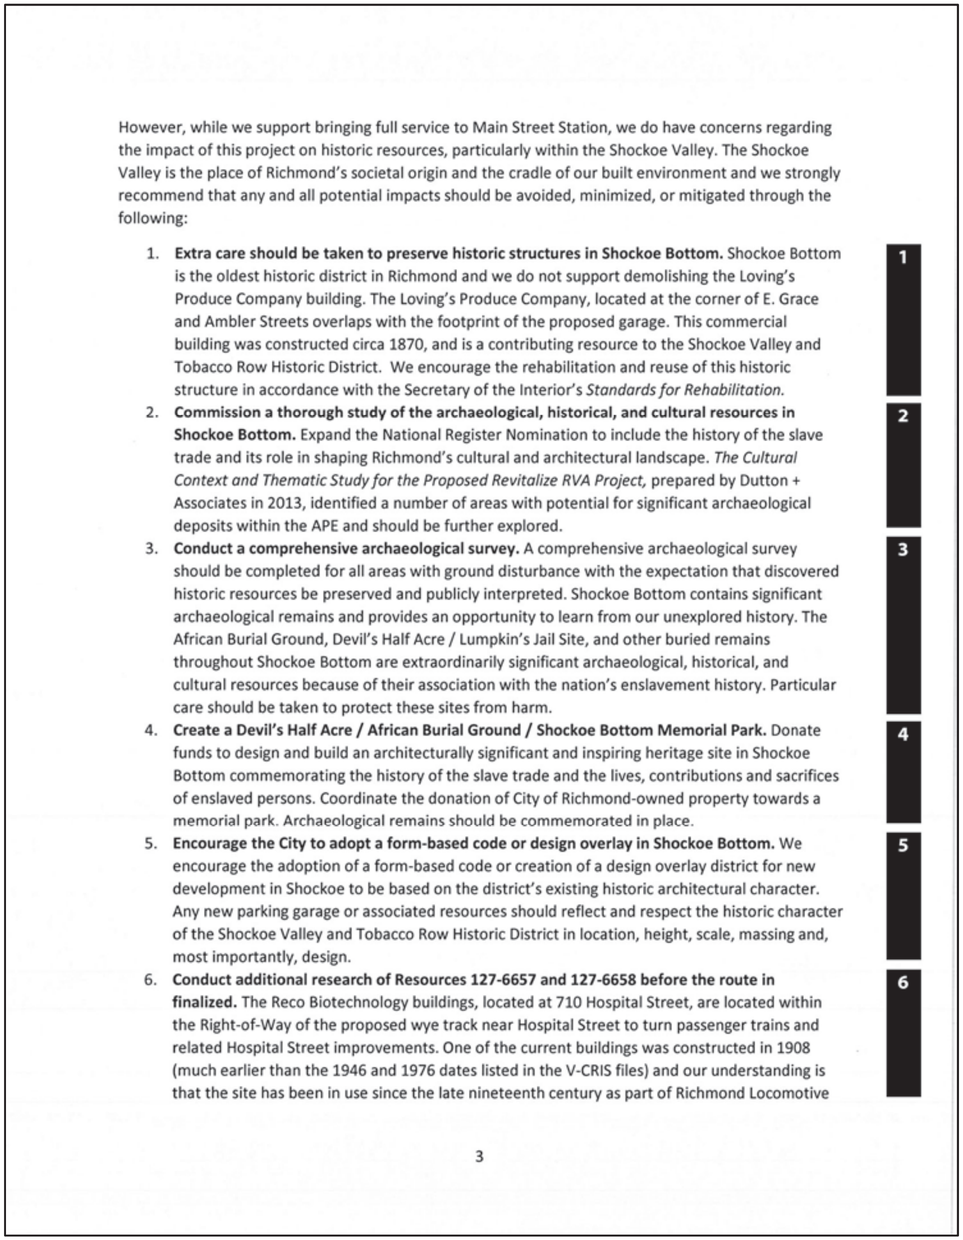
1. **Extra care should be taken to preserve historic structures in Shockoe Bottom.** Shockoe Bottom is the oldest historic district in Richmond and we do not support demolishing the Loving's Produce Company building. The Loving's Produce Company, located at the corner of E. Grace and Ambler Streets overlaps with the footprint of the proposed garage. This commercial building was constructed circa 1870, and is a contributing resource to the Shockoe Valley and Tobacco Row Historic District. We encourage the rehabilitation and reuse of this historic structure in accordance with the Secretary of the Interior's *Standards for Rehabilitation.*
2. **Commission a thorough study of the archaeological, historical, and cultural resources in Shockoe Bottom.** Expand the National Register Nomination to include the history of the slave trade and its role in shaping Richmond's cultural and architectural landscape. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project,* prepared by Dutton + Associates in 2013, identified a number of areas with potential for significant archaeological deposits within the APE and should be further explored.
3. **Conduct a comprehensive archaeological survey.** A comprehensive archaeological survey should be completed for all areas with ground disturbance with the expectation that discovered historic resources be preserved and publicly interpreted. Shockoe Bottom contains significant archaeological remains and provides an opportunity to learn from our unexplored history. The African Burial Ground, Devil's Half Acre / Lumpkin's Jail Site, and other buried remains throughout Shockoe Bottom are extraordinarily significant archaeological, historical, and cultural resources because of their association with the nation's enslavement history. Particular care should be taken to protect these sites from harm.
4. **Create a Devil's Half Acre / African Burial Ground / Shockoe Bottom Memorial Park.** Donate funds to design and build an architecturally significant and inspiring heritage site in Shockoe Bottom commemorating the history of the slave trade and the lives, contributions and sacrifices of enslaved persons. Coordinate the donation of City of Richmond-owned property towards a memorial park. Archaeological remains should be commemorated in place.
5. **Encourage the City to adopt a form-based code or design overlay in Shockoe Bottom.** We encourage the adoption of a form-based code or creation of a design overlay district for new development in Shockoe to be based on the district's existing historic architectural character. Any new parking garage or associated resources should reflect and respect the historic character of the Shockoe Valley and Tobacco Row Historic District in location, height, scale, massing and, most importantly, design.
6. **Conduct additional research of Resources 127-6657 and 127-6658 before the route in finalized.** The Reco Biotechnology buildings, located at 710 Hospital Street, are located within the Right-of-Way of the proposed wye track near Hospital Street to turn passenger trains and related Hospital Street improvements. One of the current buildings was constructed in 1908 (much earlier than the 1946 and 1976 dates listed in the V-CRIS files) and our understanding is that the site has been in use since the late nineteenth century as part of Richmond Locomotive

3

HISTORIC RICHMOND (continued)

1. The FRA and DRPT understand the sensitivity and significance of the Shockoe Bottom area, including the Loving's Produce Company, which is a contributing element to the National Register of Historic Places (NRHP)-listed Shockoe Valley and Tobacco Row Historic District. Loving's Produce Company was included in additional architectural studies completed by DRPT prior to the Final EIS, and was taken into consideration to avoid and/or minimize any impacts to the resource. The DHR determined that the resource is not individually eligible for the NRHP but remains a contributing element to the surrounding district. Alternative 6F (Full Service - Staples Mill Road/Main Street Station) was selected as the Preferred Alternative in Area 6 through Richmond. As defined in Section 4.3.6 of the Final EIS, Alternative 6F provides full service to two stations in Richmond, one serving Downtown Richmond at Main Street Station and a second serving suburban Richmond at Staples Mill Road. Chapter 4.3.6 of the Final EIS describes the infrastructure improvements proposed near Main Street Station in Area 6. Through review and investigation of historic records, consultation with consulting parties and other groups with a vested interest in area history, and in comments received from the public and Historic Richmond, DRPT has reduced the facilities proposed for construction at Main Street Station to the minimum infrastructure necessary to deliver the service proposed in the DC2RVA Project. This includes a reduction in the design length of the platforms on the east and west sides of the station to remain south of East Broad Street, and to the minimum width feasible to support the forecasted level of ridership and services provided at the station. In addition, a multistory parking deck east of Main Street Station has been removed from the plans. The provision of a two-station alternative in Richmond allows for a distribution of ridership, parking and automobile traffic among the two stations. Therefore, this minimizes the infrastructure required and potential impacts associated with Main Street Station.

(Responses are continued on next page)



However, while we support bringing full service to Main Street Station, we do have concerns regarding the impact of this project on historic resources, particularly within the Shockoe Valley. The Shockoe Valley is the place of Richmond's societal origin and the cradle of our built environment and we strongly recommend that any and all potential impacts should be avoided, minimized, or mitigated through the following:

1. **Extra care should be taken to preserve historic structures in Shockoe Bottom.** Shockoe Bottom is the oldest historic district in Richmond and we do not support demolishing the Loving's Produce Company building. The Loving's Produce Company, located at the corner of E. Grace and Ambler Streets overlaps with the footprint of the proposed garage. This commercial building was constructed circa 1870, and is a contributing resource to the Shockoe Valley and Tobacco Row Historic District. We encourage the rehabilitation and reuse of this historic structure in accordance with the Secretary of the Interior's *Standards for Rehabilitation.*
2. **Commission a thorough study of the archaeological, historical, and cultural resources in Shockoe Bottom.** Expand the National Register Nomination to include the history of the slave trade and its role in shaping Richmond's cultural and architectural landscape. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project,* prepared by Dutton + Associates in 2013, identified a number of areas with potential for significant archaeological deposits within the APE and should be further explored.
3. **Conduct a comprehensive archaeological survey.** A comprehensive archaeological survey should be completed for all areas with ground disturbance with the expectation that discovered historic resources be preserved and publicly interpreted. Shockoe Bottom contains significant archaeological remains and provides an opportunity to learn from our unexplored history. The African Burial Ground, Devil's Half Acre / Lumpkin's Jail Site, and other buried remains throughout Shockoe Bottom are extraordinarily significant archaeological, historical, and cultural resources because of their association with the nation's enslavement history. Particular care should be taken to protect these sites from harm.
4. **Create a Devil's Half Acre / African Burial Ground / Shockoe Bottom Memorial Park.** Donate funds to design and build an architecturally significant and inspiring heritage site in Shockoe Bottom commemorating the history of the slave trade and the lives, contributions and sacrifices of enslaved persons. Coordinate the donation of City of Richmond-owned property towards a memorial park. Archaeological remains should be commemorated in place.
5. **Encourage the City to adopt a form-based code or design overlay in Shockoe Bottom.** We encourage the adoption of a form-based code or creation of a design overlay district for new development in Shockoe to be based on the district's existing historic architectural character. Any new parking garage or associated resources should reflect and respect the historic character of the Shockoe Valley and Tobacco Row Historic District in location, height, scale, massing and, most importantly, design.
6. **Conduct additional research of Resources 127-6657 and 127-6658 before the route in finalized.** The Reco Biotechnology buildings, located at 710 Hospital Street, are located within the Right-of-Way of the proposed wye track near Hospital Street to turn passenger trains and related Hospital Street improvements. One of the current buildings was constructed in 1908 (much earlier than the 1946 and 1976 dates listed in the V-CRIS files) and our understanding is that the site has been in use since the late nineteenth century as part of Richmond Locomotive

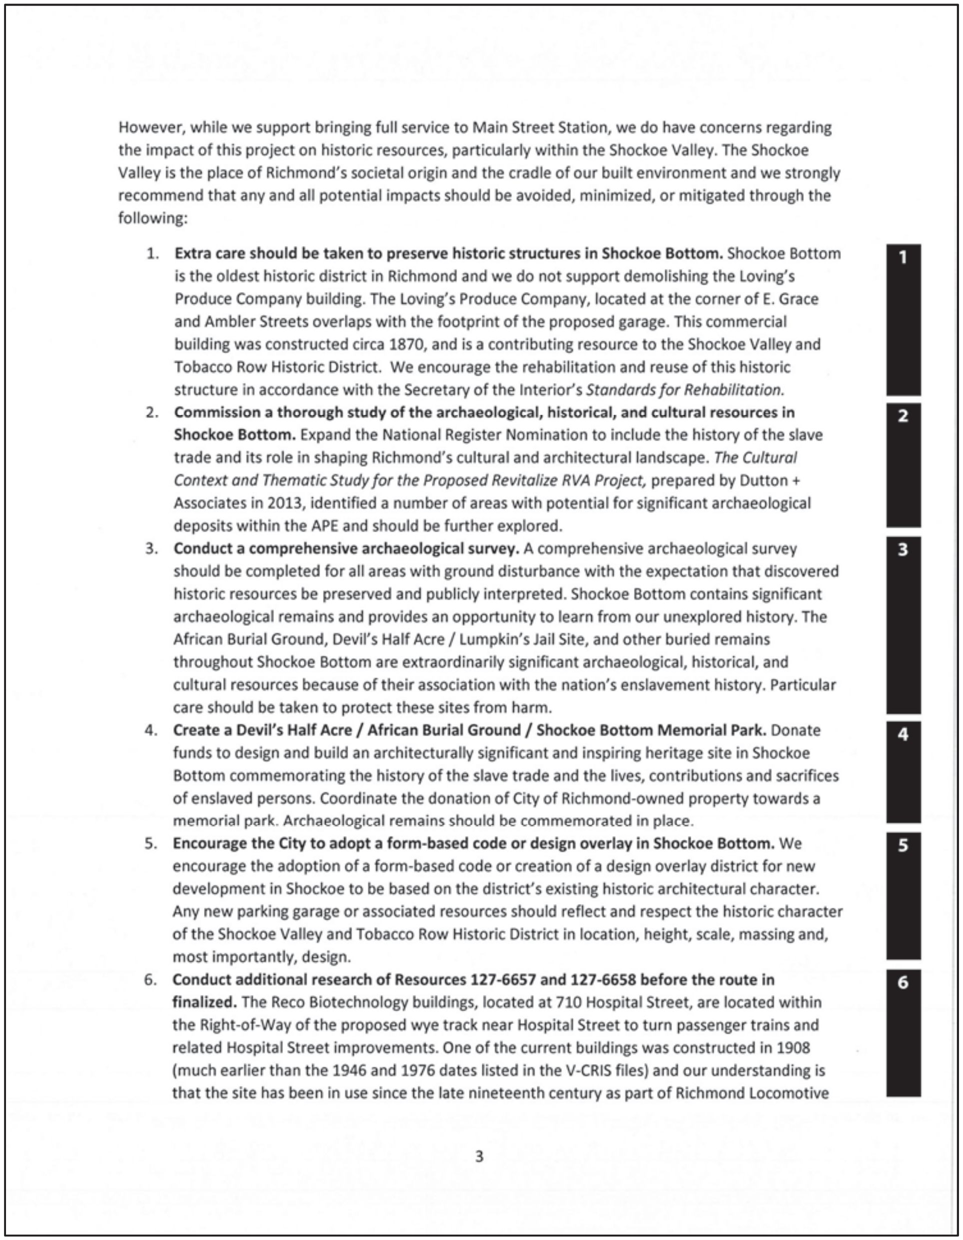
3

HISTORIC RICHMOND (continued)

Through these efforts, Project impacts have been minimized to the greatest degree possible. The Project is avoiding all recorded antebellum resources in the Shockoe Bottom area; no resources will be demolished. There will be direct impacts to three postbellum above-ground historic properties (Shockoe Valley and Tobacco Row Historic District, Main Street Station, and Seaboard Air Line Railroad). In addition, three turn-of-the-century eligible archaeological sites (44HE1095, 44HE1097, and 44HE1098) may be impacted by proposed construction. Any historic property that is adversely affected by the undertaking will be the subject of mitigation. See response to DRPT response to comment #2 below for additional details.

2. Resources in Shockoe Bottom, along with the proposed Memorial Park area, are discussed in Chapters 3 through 5 of the Draft EIS, and within several technical reports in the Draft EIS Appendix R (cultural resource technical reports) as well as Final EIS Chapters 5 and 6 and Appendix D to assure that these historic places are taken into consideration during Project planning. Additionally, Section 3.1.4 of the Final EIS provides an expanded discussion of the Main Street Station/Shockoe Bottom area, including comments and concerns from the Draft EIS related to historic context, history of the area, summary previous cultural studies, a summary of all work to date including ongoing work since the issuance of the Draft EIS, a description of the avoidance analysis performed, and future studies. The Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS) outlining stipulations to mitigate adverse effects to six historic properties in this area expounds on studies being completed as part of the Project. A recommendation on expansions to the NRHP nomination, or recordation of a new district, would likely be part of the ensuing recommendations for this area by the City of Richmond beyond the DC2RVA Project. However, DRPT recognizes the importance of this area and have committed to working with the City to define the boundaries of this district and to work with local interest groups to understand the history of this area as a stipulation for adverse effects to the surrounding Shockoe Valley and Tobacco Row Historic District.

(Responses are continued on next page)



However, while we support bringing full service to Main Street Station, we do have concerns regarding the impact of this project on historic resources, particularly within the Shockoe Valley. The Shockoe Valley is the place of Richmond's societal origin and the cradle of our built environment and we strongly recommend that any and all potential impacts should be avoided, minimized, or mitigated through the following:

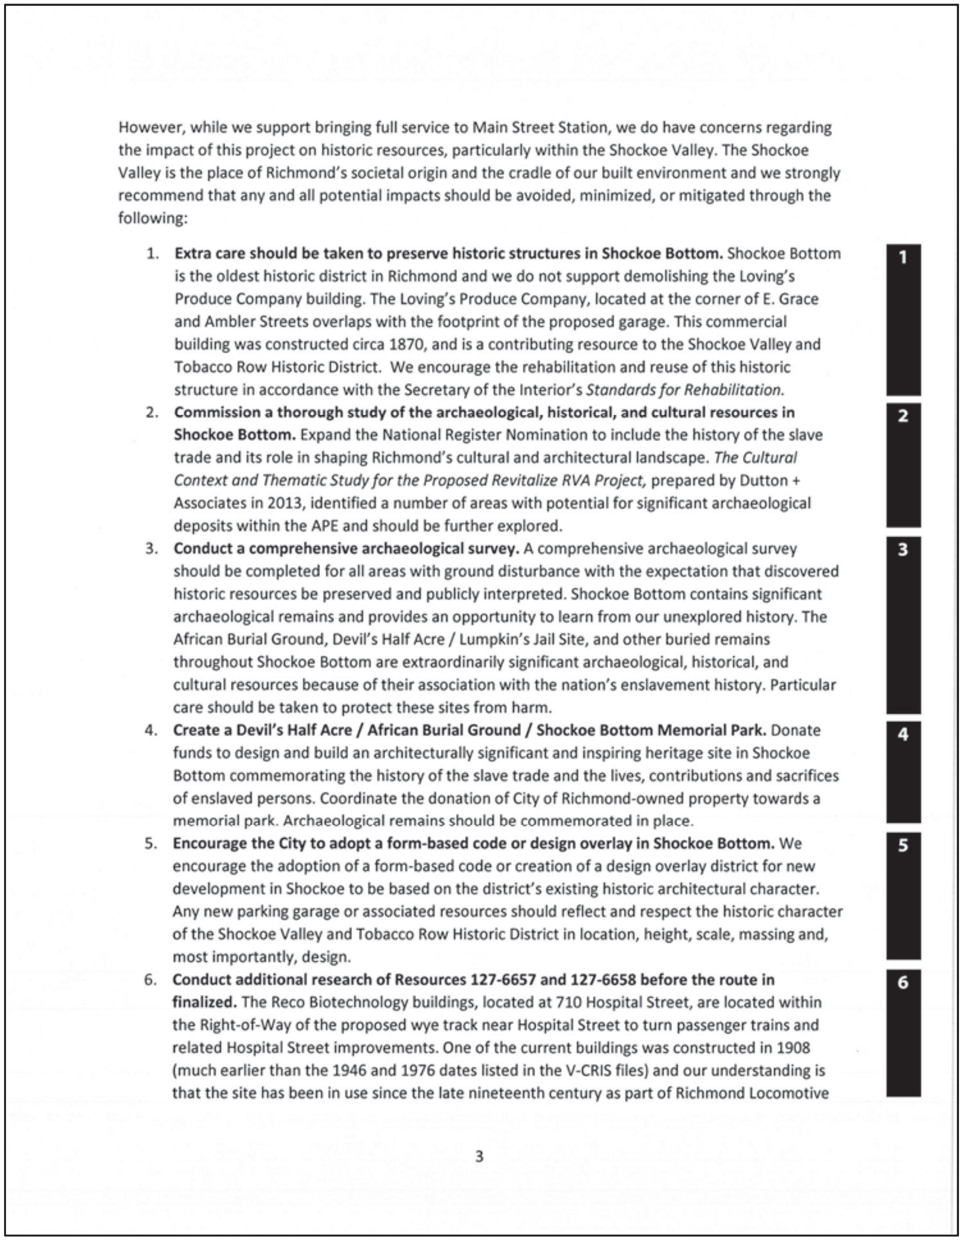
1. **Extra care should be taken to preserve historic structures in Shockoe Bottom.** Shockoe Bottom is the oldest historic district in Richmond and we do not support demolishing the Loving's Produce Company building. The Loving's Produce Company, located at the corner of E. Grace and Ambler Streets overlaps with the footprint of the proposed garage. This commercial building was constructed circa 1870, and is a contributing resource to the Shockoe Valley and Tobacco Row Historic District. We encourage the rehabilitation and reuse of this historic structure in accordance with the Secretary of the Interior's *Standards for Rehabilitation*. **1**
2. **Commission a thorough study of the archaeological, historical, and cultural resources in Shockoe Bottom.** Expand the National Register Nomination to include the history of the slave trade and its role in shaping Richmond's cultural and architectural landscape. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project*, prepared by Dutton + Associates in 2013, identified a number of areas with potential for significant archaeological deposits within the APE and should be further explored. **2**
3. **Conduct a comprehensive archaeological survey.** A comprehensive archaeological survey should be completed for all areas with ground disturbance with the expectation that discovered historic resources be preserved and publicly interpreted. Shockoe Bottom contains significant archaeological remains and provides an opportunity to learn from our unexplored history. The African Burial Ground, Devil's Half Acre / Lumpkin's Jail Site, and other buried remains throughout Shockoe Bottom are extraordinarily significant archaeological, historical, and cultural resources because of their association with the nation's enslavement history. Particular care should be taken to protect these sites from harm. **3**
4. **Create a Devil's Half Acre / African Burial Ground / Shockoe Bottom Memorial Park.** Donate funds to design and build an architecturally significant and inspiring heritage site in Shockoe Bottom commemorating the history of the slave trade and the lives, contributions and sacrifices of enslaved persons. Coordinate the donation of City of Richmond-owned property towards a memorial park. Archaeological remains should be commemorated in place. **4**
5. **Encourage the City to adopt a form-based code or design overlay in Shockoe Bottom.** We encourage the adoption of a form-based code or creation of a design overlay district for new development in Shockoe to be based on the district's existing historic architectural character. Any new parking garage or associated resources should reflect and respect the historic character of the Shockoe Valley and Tobacco Row Historic District in location, height, scale, massing and, most importantly, design. **5**
6. **Conduct additional research of Resources 127-6657 and 127-6658 before the route in finalized.** The Reco Biotechnology buildings, located at 710 Hospital Street, are located within the Right-of-Way of the proposed wye track near Hospital Street to turn passenger trains and related Hospital Street improvements. One of the current buildings was constructed in 1908 (much earlier than the 1946 and 1976 dates listed in the V-CRIS files) and our understanding is that the site has been in use since the late nineteenth century as part of Richmond Locomotive **6**

3

HISTORIC RICHMOND (continued)

3. The DC2RVA limits of disturbance (LOD) have been the subject of a Phase IA archaeological reconnaissance and predictive model and Phase IB surveys, which included noting previously recorded sites and recording new resources in any area where ground-disturbing activities may occur. The predictive model and survey report can be found in Appendix R of the Draft EIS. The addendum archaeological survey report can be found in Appendix D of the Final EIS. DRPT minimized the Project footprint to the extent possible to avoid both identified and unknown archaeological resources, including Lumpkins Jail/Devil's Half Acre and the Burial Ground, among others, such as eliminating the multistory parking deck planned for east of Main Street Station. The Project, as currently designed, does not impact the known boundaries of these sites. At the request of consulting parties, Lumpkins Jail and the Graveyard for Free People of Color and Slaves, located just north of Shockoe Bottom, were added to the list of historic properties in the APE (see Section 5.13 of the Final EIS), and the FRA determined that the Project will have no adverse effect on these resources. The DHR concurred. FRA and DRPT fully recognize that unrecorded archaeological sites likely exist in the general Project vicinity. DRPT is fully committed to conducting full archaeological studies on any area where disturbance cannot be avoided. Details on the data recovery efforts are outlined in the Section 106 Draft MOA (Appendix K of the Final EIS). Regarding archaeological studies outside of the limits of disturbance, however, DRPT has discussed the issue extensively with the DHR, and the DHR has concluded that preservation in place is the priority, as archaeology can be a destructive science.
4. Mitigation for adverse effects to the Shockoe Valley and Tobacco Row Historic District, as outlined in the Section 106 Draft MOA (Appendix K of the Final EIS), include studies that will aid in this process. The Historic Richmond Foundation and the City of Richmond, as consulting parties, are involved in developing the Section 106 Draft MOA.
5. Comment noted. DRPT would comply with all City standards and codes during final design of the Project, after incremental improvements are scheduled and funding is secured.

(Responses are continued on next page)

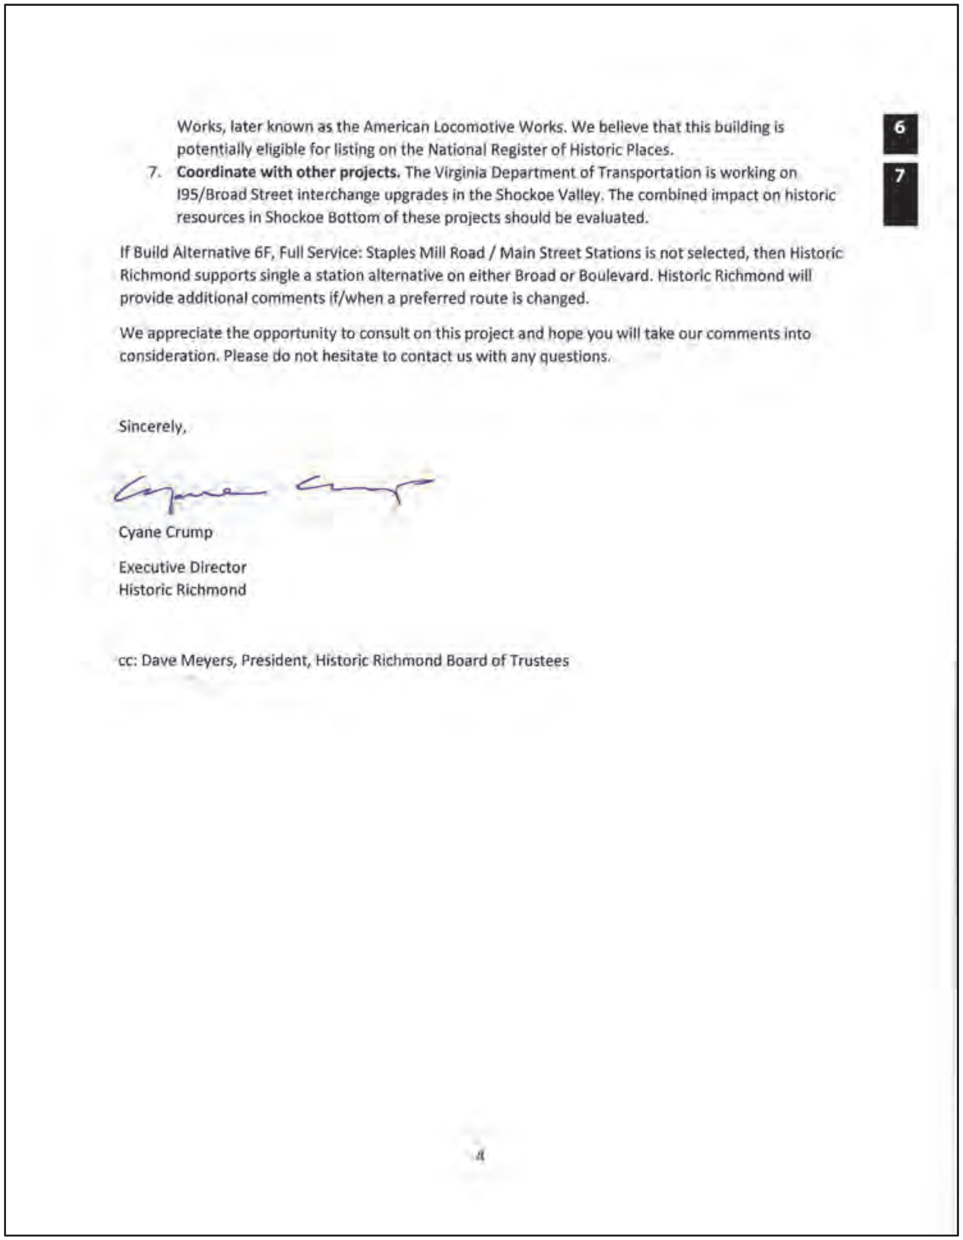


However, while we support bringing full service to Main Street Station, we do have concerns regarding the impact of this project on historic resources, particularly within the Shockoe Valley. The Shockoe Valley is the place of Richmond's societal origin and the cradle of our built environment and we strongly recommend that any and all potential impacts should be avoided, minimized, or mitigated through the following:

1. **Extra care should be taken to preserve historic structures in Shockoe Bottom.** Shockoe Bottom is the oldest historic district in Richmond and we do not support demolishing the Loving's Produce Company building. The Loving's Produce Company, located at the corner of E. Grace and Ambler Streets overlaps with the footprint of the proposed garage. This commercial building was constructed circa 1870, and is a contributing resource to the Shockoe Valley and Tobacco Row Historic District. We encourage the rehabilitation and reuse of this historic structure in accordance with the Secretary of the Interior's *Standards for Rehabilitation.*
2. **Commission a thorough study of the archaeological, historical, and cultural resources in Shockoe Bottom.** Expand the National Register Nomination to include the history of the slave trade and its role in shaping Richmond's cultural and architectural landscape. *The Cultural Context and Thematic Study for the Proposed Revitalize RVA Project,* prepared by Dutton + Associates in 2013, identified a number of areas with potential for significant archaeological deposits within the APE and should be further explored.
3. **Conduct a comprehensive archaeological survey.** A comprehensive archaeological survey should be completed for all areas with ground disturbance with the expectation that discovered historic resources be preserved and publicly interpreted. Shockoe Bottom contains significant archaeological remains and provides an opportunity to learn from our unexplored history. The African Burial Ground, Devil's Half Acre / Lumpkin's Jail Site, and other buried remains throughout Shockoe Bottom are extraordinarily significant archaeological, historical, and cultural resources because of their association with the nation's enslavement history. Particular care should be taken to protect these sites from harm.
4. **Create a Devil's Half Acre / African Burial Ground / Shockoe Bottom Memorial Park.** Donate funds to design and build an architecturally significant and inspiring heritage site in Shockoe Bottom commemorating the history of the slave trade and the lives, contributions and sacrifices of enslaved persons. Coordinate the donation of City of Richmond-owned property towards a memorial park. Archaeological remains should be commemorated in place.
5. **Encourage the City to adopt a form-based code or design overlay in Shockoe Bottom.** We encourage the adoption of a form-based code or creation of a design overlay district for new development in Shockoe to be based on the district's existing historic architectural character. Any new parking garage or associated resources should reflect and respect the historic character of the Shockoe Valley and Tobacco Row Historic District in location, height, scale, massing and, most importantly, design.
6. **Conduct additional research of Resources 127-6657 and 127-6658 before the route in finalized.** The Reco Biotechnology buildings, located at 710 Hospital Street, are located within the Right-of-Way of the proposed wye track near Hospital Street to turn passenger trains and related Hospital Street improvements. One of the current buildings was constructed in 1908 (much earlier than the 1946 and 1976 dates listed in the V-CRIS files) and our understanding is that the site has been in use since the late nineteenth century as part of Richmond Locomotive

HISTORIC RICHMOND (continued)

6. The resource was preliminarily recorded during architectural studies associated with the Project in 2016, and the building was the subject of additional investigation in 2017/2018. In addition, the parcel was studied for potentially intact archaeological remains in 2018. Copies of the 2018 architectural report and archaeological study can be found in Appendix D of the Final EIS. Upon review of the data, DHR determined that this building is not individually eligible for the National Register of Historic Places. As such, this parcel is not listed as a historic property in the Final EIS. However, the building and its landscape were noted during the planning process, and DRPT removed the need for modifications to this property by eliminating planned construction for a wye in this area; refer to Appendix J of the Final EIS for details on the revised Richmond area turning wye and service yard location that is part of the Preferred Alternative, which is also summarized in Section 4.6 of the Final EIS.



Works, later known as the American Locomotive Works. We believe that this building is potentially eligible for listing on the National Register of Historic Places. 6

7. **Coordinate with other projects.** The Virginia Department of Transportation is working on I95/Broad Street interchange upgrades in the Shockoe Valley. The combined impact on historic resources in Shockoe Bottom of these projects should be evaluated. 7

If Build Alternative 6F, Full Service: Staples Mill Road / Main Street Stations is not selected, then Historic Richmond supports single a station alternative on either Broad or Boulevard. Historic Richmond will provide additional comments if/when a preferred route is changed.

We appreciate the opportunity to consult on this project and hope you will take our comments into consideration. Please do not hesitate to contact us with any questions.

Sincerely,

Cyane Crump

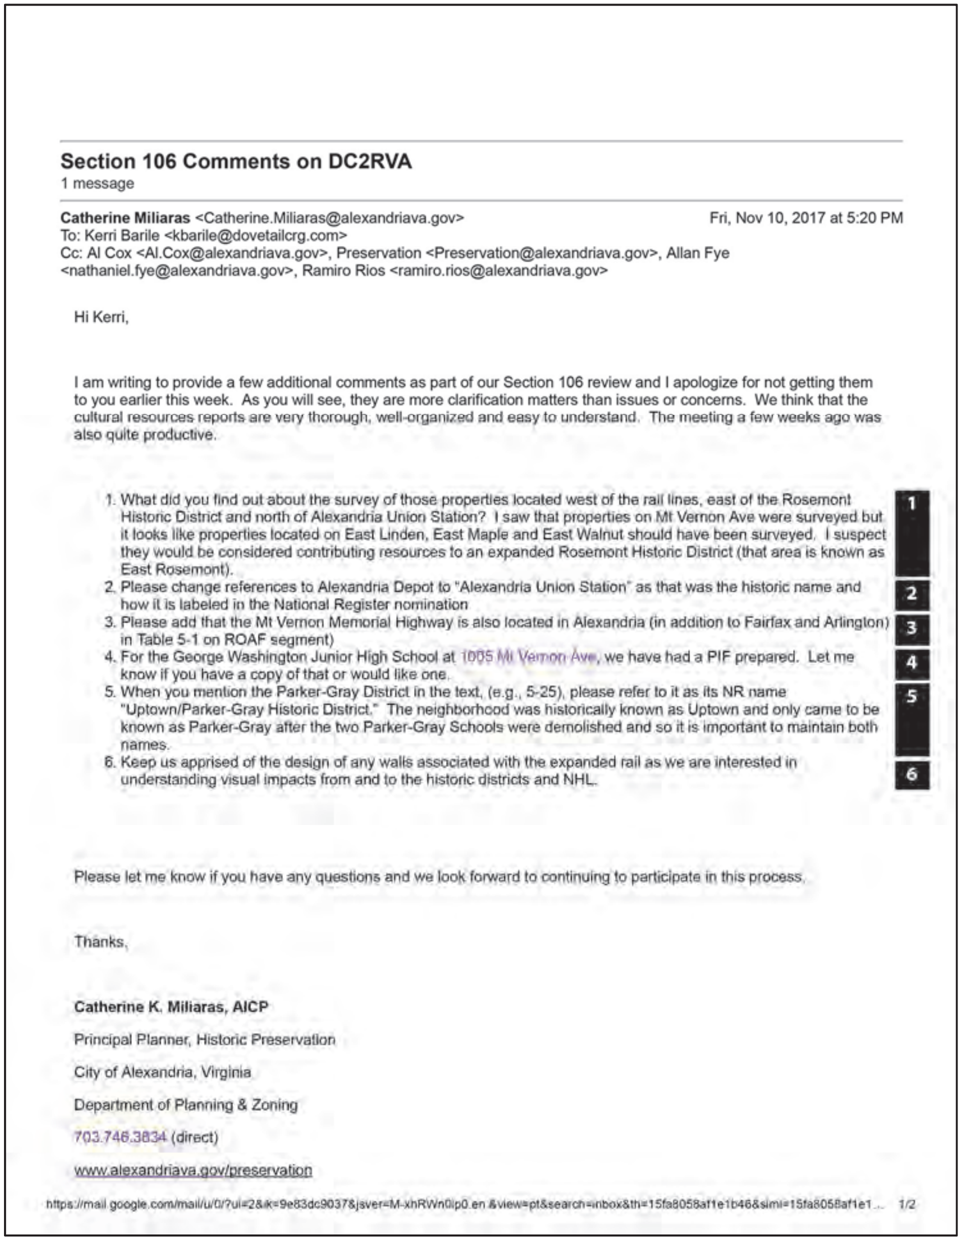
HISTORIC RICHMOND (continued)

(Response to comment 6 on previous page)

7. Potential construction elements of the I-95/Broad Street Interchange Improvements and VDOT studies on historic resources in Shockoe Valley associated with this undertaking were taken into consideration during the Project as background data and to assure consistent methodologies and resource evaluations. Chapter 3 of the Final EIS includes the results of the background review completed as part of the Project including details on the Shockoe Bottom area and I-95 street improvements as they relate to the current Project area. Additionally, the referenced project has been added to the indirect and cumulative effects section, both in terms of potential impacts on land use and historic properties; refer to Section 5.20 of the Final EIS.



Section 106 Comments on DC2RVA

Hi Kerri,

I am writing to provide a few additional comments as part of our Section 106 review and I apologize for not getting them to you earlier this week. As you will see, they are more clarification matters than issues or concerns. We think that the cultural resources reports are very thorough, well-organized and easy to understand. The meeting a few weeks ago was also quite productive.

1. What did you find out about the survey of those properties located west of the rail lines, east of the Rosemont Historic District and north of Alexandria Union Station? I saw that properties on Mt Vernon Ave were surveyed but it looks like properties located on East Linden, East Maple and East Walnut should have been surveyed. I suspect they would be considered contributing resources to an expanded Rosemont Historic District (that area is known as East Rosemont). 1
2. Please change references to Alexandria Depot to "Alexandria Union Station" as that was the historic name and how it is labeled in the National Register nomination 2
3. Please add that the Mt Vernon Memorial Highway is also located in Alexandria (in addition to Fairfax and Arlington) in Table 5-1 on ROAF segment) 3
4. For the George Washington Junior High School at 1005 Mt Vernon Ave, we have had a PIF prepared. Let me know if you have a copy of that or would like one. 4
5. When you mention the Parker-Gray District in the text, (e.g., 5-25), please refer to it as its NR name "Uptown/Parker-Gray Historic District." The neighborhood was historically known as Uptown and only came to be known as Parker-Gray after the two Parker-Gray Schools were demolished and so it is important to maintain both names. 5
6. Keep us apprised of the design of any walls associated with the expanded rail as we are interested in understanding visual impacts from and to the historic districts and NHL. 6

Please let me know if you have any questions and we look forward to continuing to participate in this process.

Thanks,

Catherine K. Miliaras, AICP

CITY OF ALEXANDRIA, DEPARTMENT OF PLANNING AND ZONING

[Note that while the letter from the City of Alexandria Department of Planning and Zoning is in reference to Section 106 review, DRPT provided responses in the same format as other letters received with comments on the Draft EIS.]

1. DRPT has worked with the City of Alexandria to clarify the issues referenced in this comment. DRPT revisited this area to ensure that all resources over 48 years in age were recorded in the area of potential effects (APE) and shared the results with the City as well as the Virginia Department of Historic Resources (DHR). This includes additional reconnaissance and intensive architectural studies, additional archaeological work, and revisiting several resources as requested by the locality, including an evaluation of the East Rosemont Historic District. Appendix D of the Final EIS has copies of all the additional 2018 technical reports. Based on analysis and coordination associated with the Final EIS, there are eight historic properties within the Project APE. All eight have been evaluated and coordinated with the DHR regarding effect: RF&P Railroad (adverse effect; use); Mount Vernon Memorial Highway (no adverse effect; de minimis use); George Washington Junior High School (no effect; no use); Parker-Gray Historic District/Uptown (no adverse effect; no use); Rosemont Historic District (no adverse effect; de minimis use); Alexandria Union Station (no adverse effect; de minimis use); George Washington National Masonic Memorial (no effect, no use); and Phoenix Mill (no adverse effect, no use). Alexandria Archaeology concurred with these determinations in a letter dated July 11, 2018.

2. DRPT agrees that the term "Alexandria Union Station" reflects its historic name and how it is labeled in the National Register nomination. Draft EIS references to the "Alexandria Depot" are corrected in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

3. DRPT concurs that the Mount Vernon Memorial Highway is located in Alexandria in addition to Arlington and Fairfax Counties. This change has been made, as applicable, within the Final EIS.

CITY OF ALEXANDRIA, DEPARTMENT OF PLANNING AND ZONING (continued)

4. Based on the coordination between DRPT and City of Alexandria to clarify this issue, DRPT determined the PIF for George Washington Junior High School would not be submitted to the DHR in time for evaluation prior to completion of the Final EIS. Based on an analysis of the project plans in this area, the FRA has determined that the DC2RVA Project will have no effect on this resource. The DHR concurred with this determination in a letter dated June 28, 2018.

5. DRPT agrees that the term "Uptown/Parker-Gray Historic District" matches its National Register name. Draft EIS references to the "Parker Gray District" are corrected in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

6. All consulting parties to the Section 106 process, including the City, will continue to be informed by FRA and DRPT of all steps in the cultural resource process, such as stipulations set forth in the Section 106 Draft Memorandum of Agreement (see Appendix K of the Final EIS), or upcoming meetings. See Appendix E of the Final EIS for copies of all Section 106 Project correspondence.

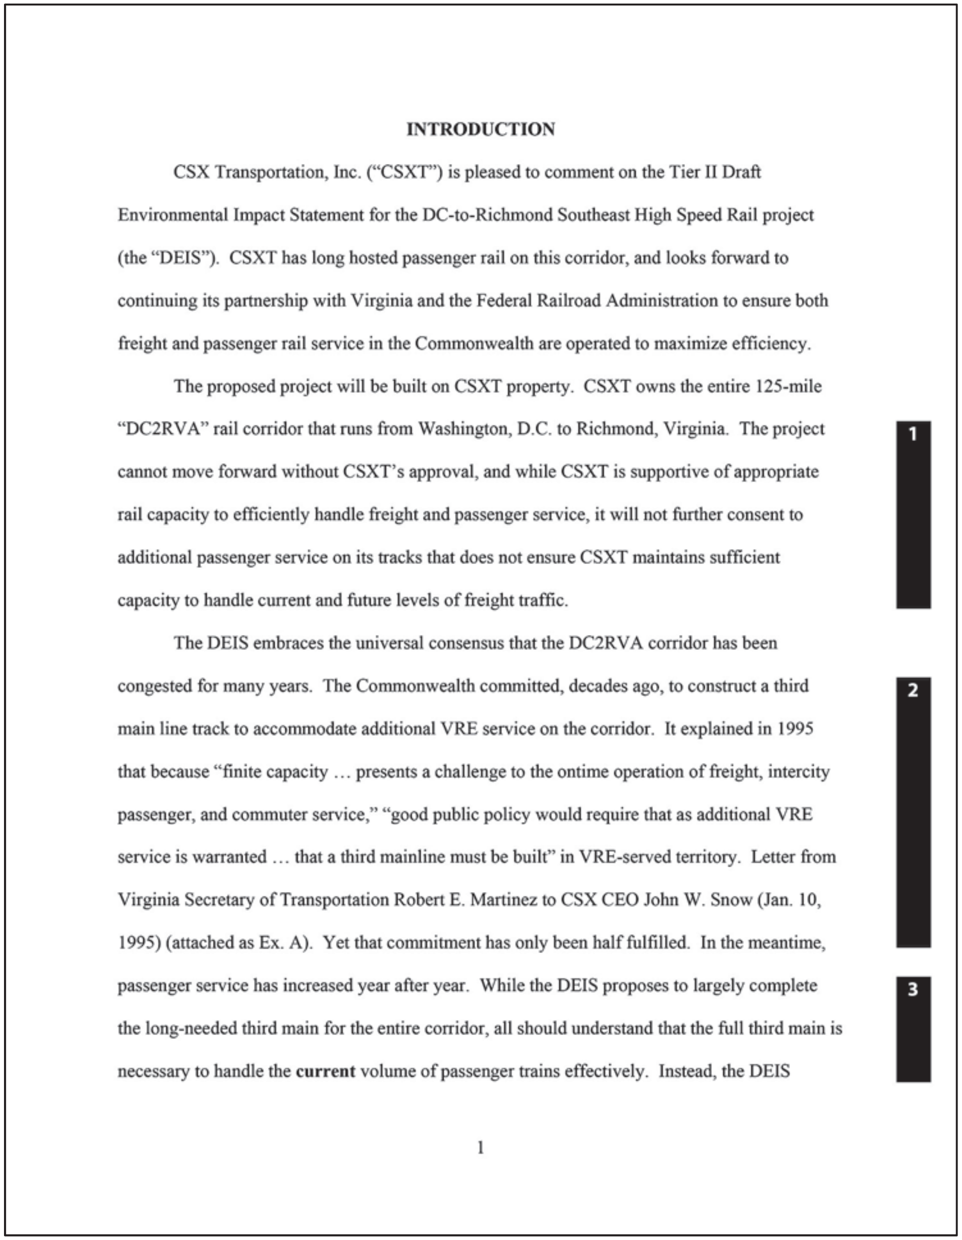
DC-TO-RICHMOND SOUTHEAST HIGH SPEED RAIL
TIER II DRAFT ENVIRONMENTAL IMPACT STUDY

COMMENTS OF CSX TRANSPORTATION, INC.

NOVEMBER 7, 2017

CSXT (continued)

(No comments on this page)



INTRODUCTION

CSX Transportation, Inc. ("CSXT") is pleased to comment on the Tier II Draft Environmental Impact Statement for the DC-to-Richmond Southeast High Speed Rail project (the "DEIS"). CSXT has long hosted passenger rail on this corridor, and looks forward to continuing its partnership with Virginia and the Federal Railroad Administration to ensure both freight and passenger rail service in the Commonwealth are operated to maximize efficiency.

The proposed project will be built on CSXT property. CSXT owns the entire 125-mile "DC2RVA" rail corridor that runs from Washington, D.C. to Richmond, Virginia. The project cannot move forward without CSXT's approval, and while CSXT is supportive of appropriate rail capacity to efficiently handle freight and passenger service, it will not further consent to additional passenger service on its tracks that does not ensure CSXT maintains sufficient capacity to handle current and future levels of freight traffic.

The DEIS embraces the universal consensus that the DC2RVA corridor has been congested for many years. The Commonwealth committed, decades ago, to construct a third main line track to accommodate additional VRE service on the corridor. It explained in 1995 that because "finite capacity … presents a challenge to the ontime operation of freight, intercity passenger, and commuter service," "good public policy would require that as additional VRE service is warranted … that a third mainline must be built" in VRE-served territory. Letter from Virginia Secretary of Transportation Robert E. Martinez to CSX CEO John W. Snow (Jan. 10, 1995) (attached as Ex. A). Yet that commitment has only been half fulfilled. In the meantime, passenger service has increased year after year. While the DEIS proposes to largely complete the long-needed third main for the entire corridor, all should understand that the full third main is necessary to handle the **current** volume of passenger trains effectively. Instead, the DEIS

1

CSXT (continued)

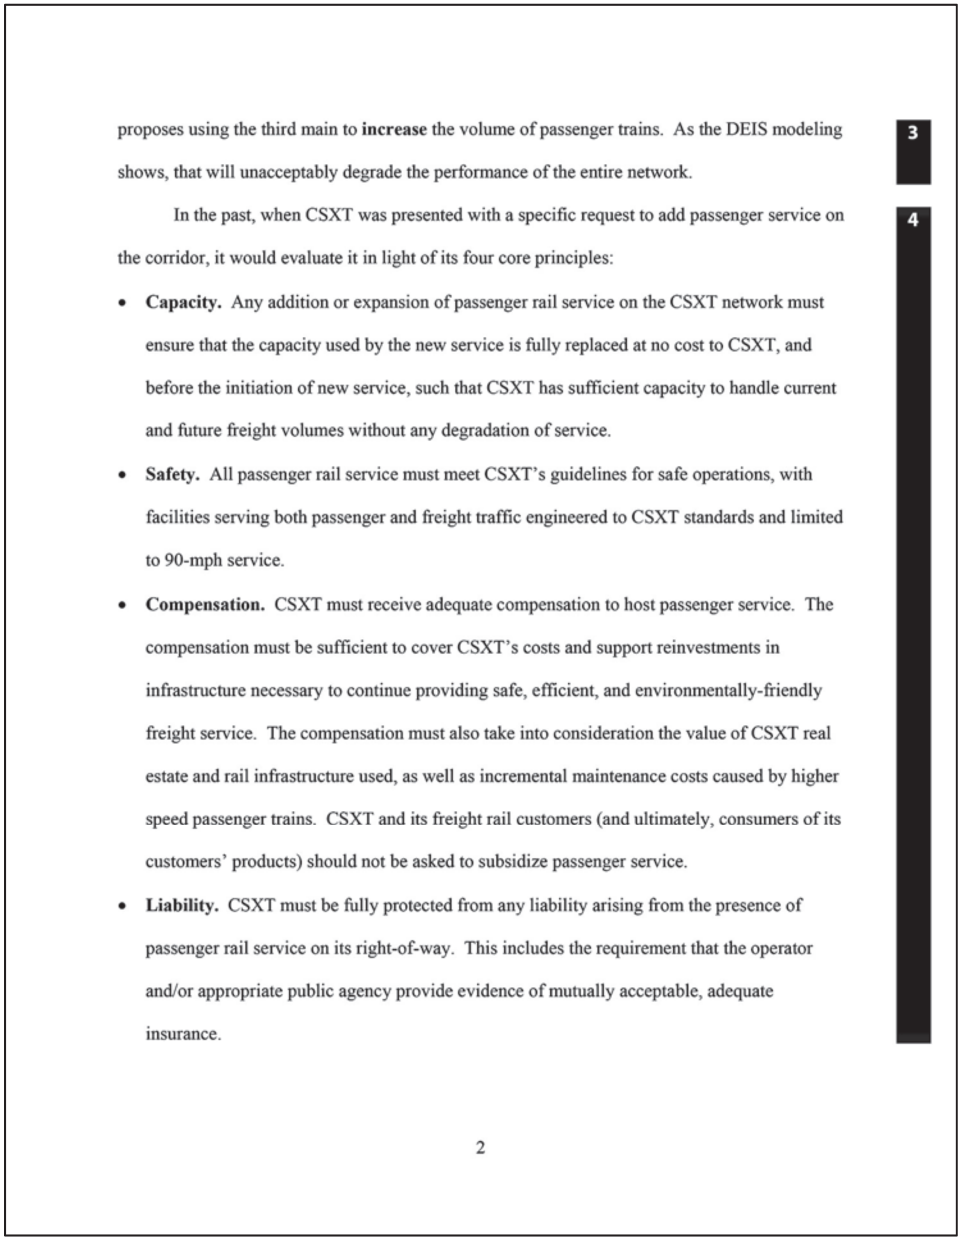
Note that the response numbering corresponds to the DRPT-numbered statements (as indicated by the numbered black bars on the right side of the CSXT letter), and is not intended to align with the section numbering within the CSXT letter.

1. The Department of Rail and Public Transportation (DRPT) acknowledges that CSXT owns the entire 123-mile DC2RVA rail corridor. DRPT looks forward to continuing close cooperation with CSXT on projects in the rail corridor that increase rail capacity to efficiently handle freight and passenger service.

   DRPT notes that, in addition to the responses provided to CSXT's letter dated November 7, 2017, much of the content of these responses to CSXT's comments are contained within the DC2RVA Project Recommendation Report for the Preferred Alternative, which is Appendix I of the Final EIS.

2. DRPT has been working in partnership with CSXT on several projects to construct a third main line track to accommodate additional VRE service on the corridor, such as the Crossroads to Hamilton third track project completed in May 2016, and the Atlantic Gateway project to add a third main line track between Franconia and Occoquan, which is currently in the initial phases of design. In addition, DRPT is working with CSXT and the Federal Railroad Administration (FRA) to add a third main line track in the corridor between Powells Creek and Arkendale. Both of these separate projects are referenced in Chapter 4 of the Final EIS.

3. The Preferred Alternative, as defined in Chapter 4 of the Final EIS, proposes to construct a third main line track for the entire corridor, including the portion of the corridor south of the Virginia Railway Express (VRE) commuter-served territory not covered under existing commitments, except where limited by existing physical, environmental or historic conditions, such as in Area 5 through downtown Ashland.



3

proposes using the third main to **increase** the volume of passenger trains. As the DEIS modeling shows, that will unacceptably degrade the performance of the entire network.

4

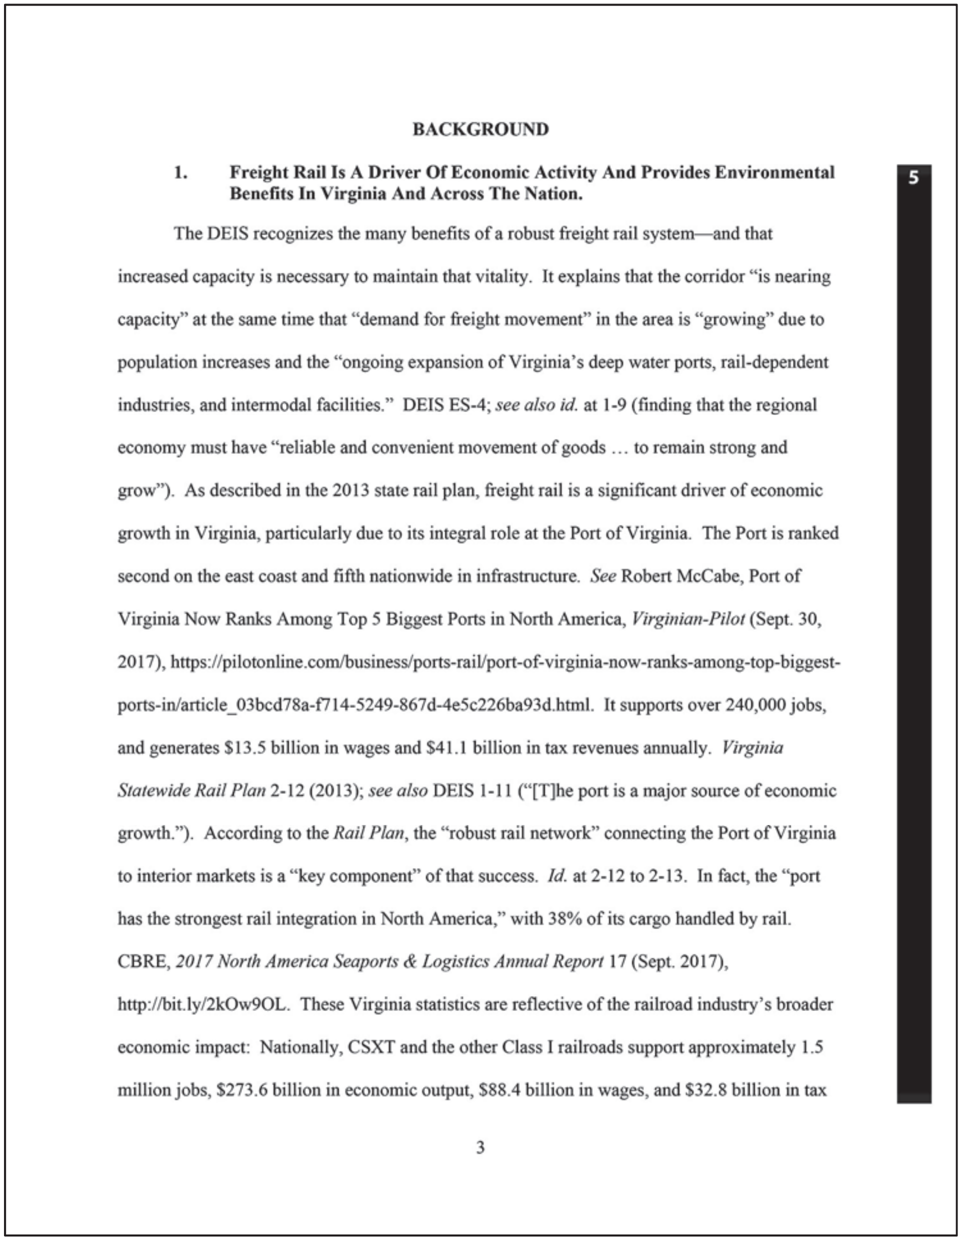
In the past, when CSXT was presented with a specific request to add passenger service on the corridor, it would evaluate it in light of its four core principles:

- **Capacity.** Any addition or expansion of passenger rail service on the CSXT network must ensure that the capacity used by the new service is fully replaced at no cost to CSXT, and before the initiation of new service, such that CSXT has sufficient capacity to handle current and future freight volumes without any degradation of service.
- **Safety.** All passenger rail service must meet CSXT's guidelines for safe operations, with facilities serving both passenger and freight traffic engineered to CSXT standards and limited to 90-mph service.
- **Compensation.** CSXT must receive adequate compensation to host passenger service. The compensation must be sufficient to cover CSXT's costs and support reinvestments in infrastructure necessary to continue providing safe, efficient, and environmentally-friendly freight service. The compensation must also take into consideration the value of CSXT real estate and rail infrastructure used, as well as incremental maintenance costs caused by higher speed passenger trains. CSXT and its freight rail customers (and ultimately, consumers of its customers' products) should not be asked to subsidize passenger service.
- **Liability.** CSXT must be fully protected from any liability arising from the presence of passenger rail service on its right-of-way. This includes the requirement that the operator and/or appropriate public agency provide evidence of mutually acceptable, adequate insurance.

CSXT (continued)

(Response to comment 3 on previous page)

4. DRPT acknowledges CSXT's statement of its four core principles for permitting new passenger rail services on its lines.



BACKGROUND

1. Freight Rail Is A Driver Of Economic Activity And Provides Environmental Benefits In Virginia And Across The Nation.

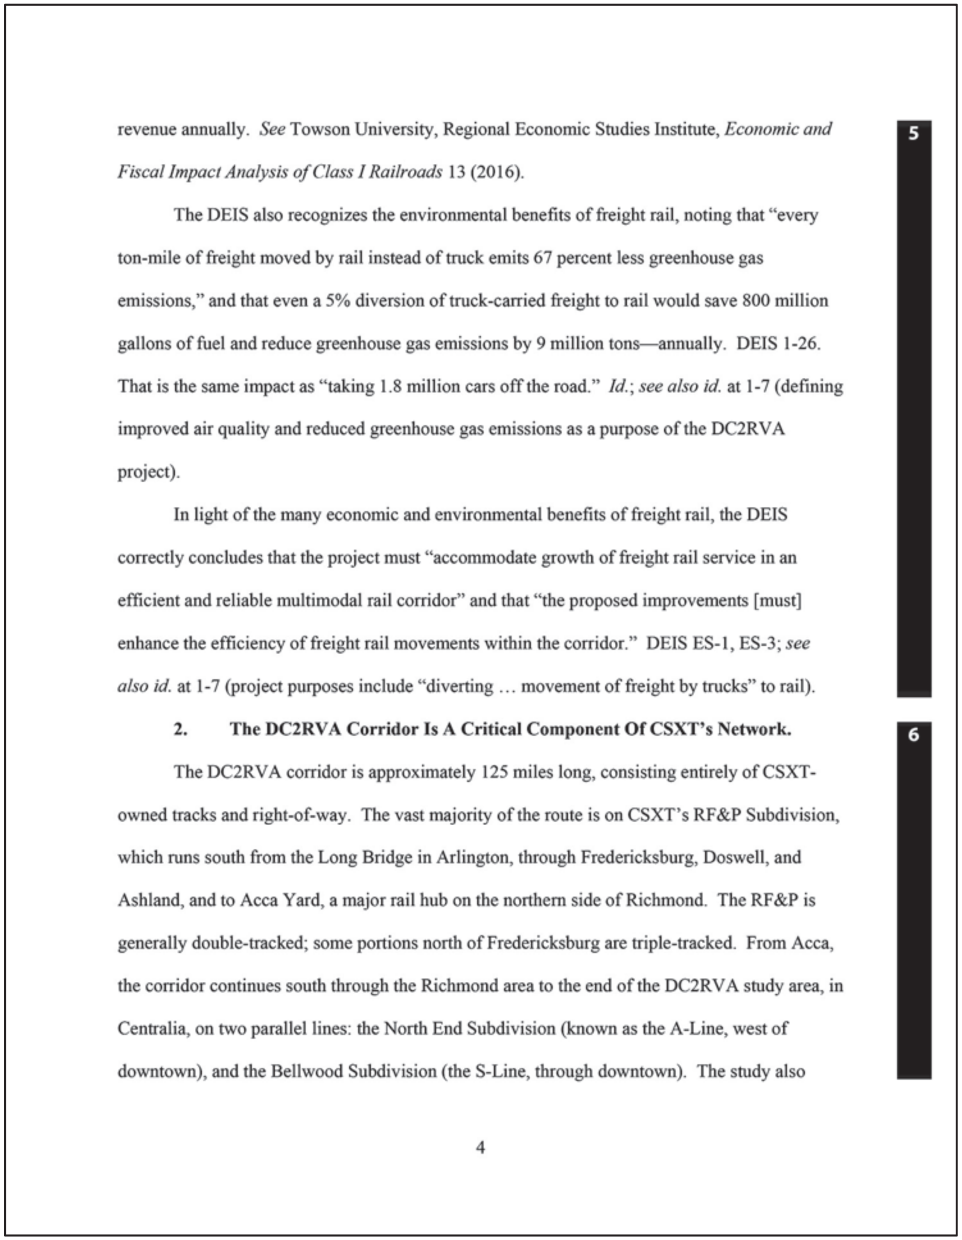
5

The DEIS recognizes the many benefits of a robust freight rail system—and that increased capacity is necessary to maintain that vitality. It explains that the corridor "is nearing capacity" at the same time that "demand for freight movement" in the area is "growing" due to population increases and the "ongoing expansion of Virginia's deep water ports, rail-dependent industries, and intermodal facilities." DEIS ES-4; *see also id.* at 1-9 (finding that the regional economy must have "reliable and convenient movement of goods … to remain strong and grow"). As described in the 2013 state rail plan, freight rail is a significant driver of economic growth in Virginia, particularly due to its integral role at the Port of Virginia. The Port is ranked second on the east coast and fifth nationwide in infrastructure. *See* Robert McCabe, Port of Virginia Now Ranks Among Top 5 Biggest Ports in North America, *Virginian-Pilot* (Sept. 30, 2017), https://pilotonline.com/business/ports-rail/port-of-virginia-now-ranks-among-top-biggest-ports-in/article_03bcd78a-f714-5249-867d-4e5c226ba93d.html. It supports over 240,000 jobs, and generates $13.5 billion in wages and $41.1 billion in tax revenues annually. *Virginia Statewide Rail Plan* 2-12 (2013); *see also* DEIS 1-11 ("[T]he port is a major source of economic growth."). According to the *Rail Plan*, the "robust rail network" connecting the Port of Virginia to interior markets is a "key component" of that success. *Id.* at 2-12 to 2-13. In fact, the "port has the strongest rail integration in North America," with 38% of its cargo handled by rail. CBRE, *2017 North America Seaports & Logistics Annual Report* 17 (Sept. 2017), http://bit.ly/2kOw9OL. These Virginia statistics are reflective of the railroad industry's broader economic impact: Nationally, CSXT and the other Class I railroads support approximately 1.5 million jobs, $273.6 billion in economic output, $88.4 billion in wages, and $32.8 billion in tax

3

CSXT (continued)

5. DRPT concurs that freight rail is a driver of economic activity and provides environmental benefits in Virginia and across the nation.



5 revenue annually. *See* Towson University, Regional Economic Studies Institute, *Economic and Fiscal Impact Analysis of Class I Railroads* 13 (2016).

The DEIS also recognizes the environmental benefits of freight rail, noting that "every ton-mile of freight moved by rail instead of truck emits 67 percent less greenhouse gas emissions," and that even a 5% diversion of truck-carried freight to rail would save 800 million gallons of fuel and reduce greenhouse gas emissions by 9 million tons—annually. DEIS 1-26. That is the same impact as "taking 1.8 million cars off the road." *Id.*; *see also id.* at 1-7 (defining improved air quality and reduced greenhouse gas emissions as a purpose of the DC2RVA project).

In light of the many economic and environmental benefits of freight rail, the DEIS correctly concludes that the project must "accommodate growth of freight rail service in an efficient and reliable multimodal rail corridor" and that "the proposed improvements [must] enhance the efficiency of freight rail movements within the corridor." DEIS ES-1, ES-3; *see also id.* at 1-7 (project purposes include "diverting … movement of freight by trucks" to rail).

6 **2. The DC2RVA Corridor Is A Critical Component Of CSXT's Network.**

The DC2RVA corridor is approximately 125 miles long, consisting entirely of CSXT-owned tracks and right-of-way. The vast majority of the route is on CSXT's RF&P Subdivision, which runs south from the Long Bridge in Arlington, through Fredericksburg, Doswell, and Ashland, and to Acca Yard, a major rail hub on the northern side of Richmond. The RF&P is generally double-tracked; some portions north of Fredericksburg are triple-tracked. From Acca, the corridor continues south through the Richmond area to the end of the DC2RVA study area, in Centralia, on two parallel lines: the North End Subdivision (known as the A-Line, west of downtown), and the Bellwood Subdivision (the S-Line, through downtown). The study also

4

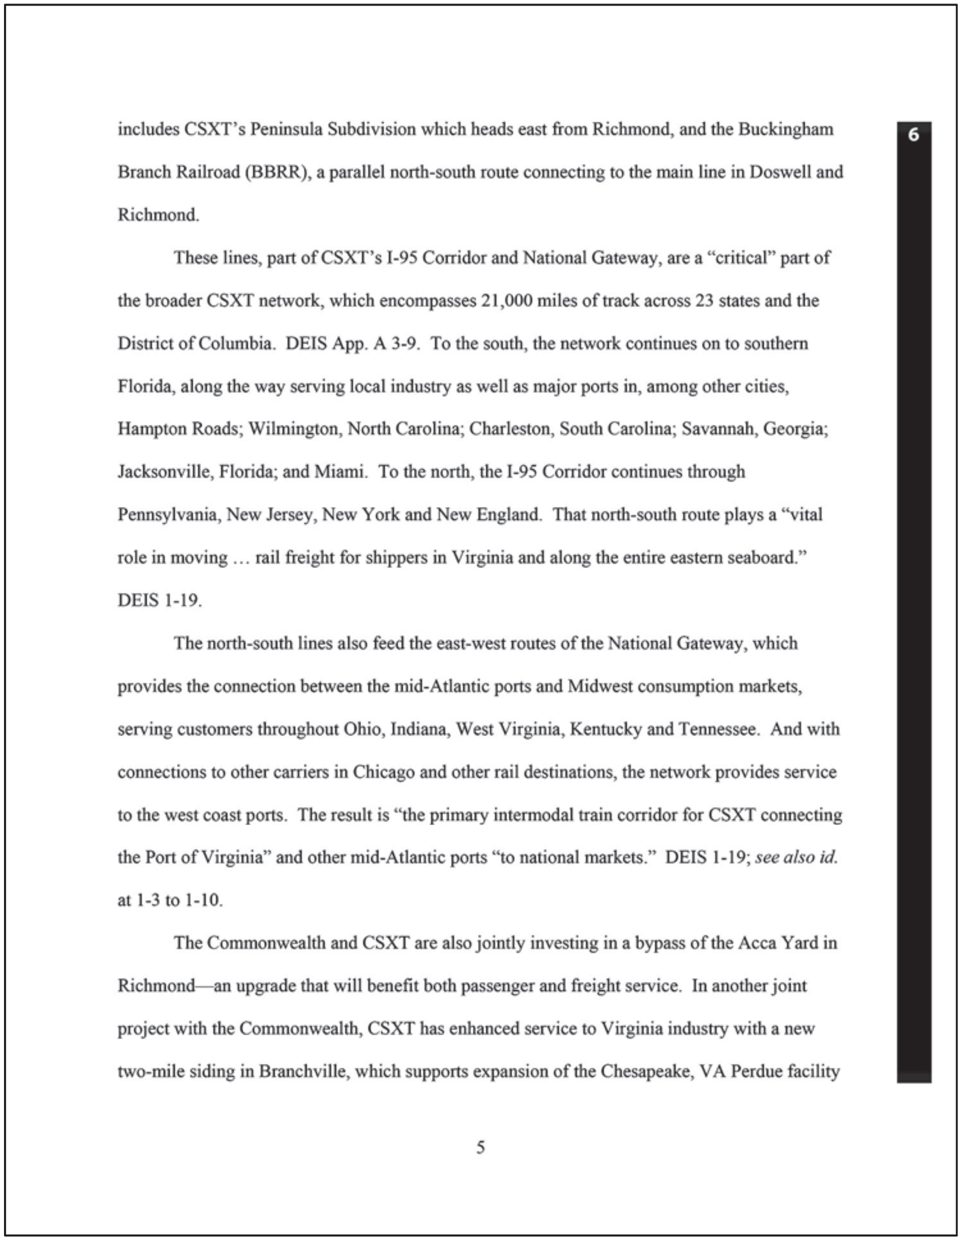
CSXT (continued)

(Response to comment 5 on previous page)

6. DRPT concurs that the DC2RVA corridor is a critical component of CSXT's rail network.

CSXT (continued)

(For response to comment 6, refer to page B-332)



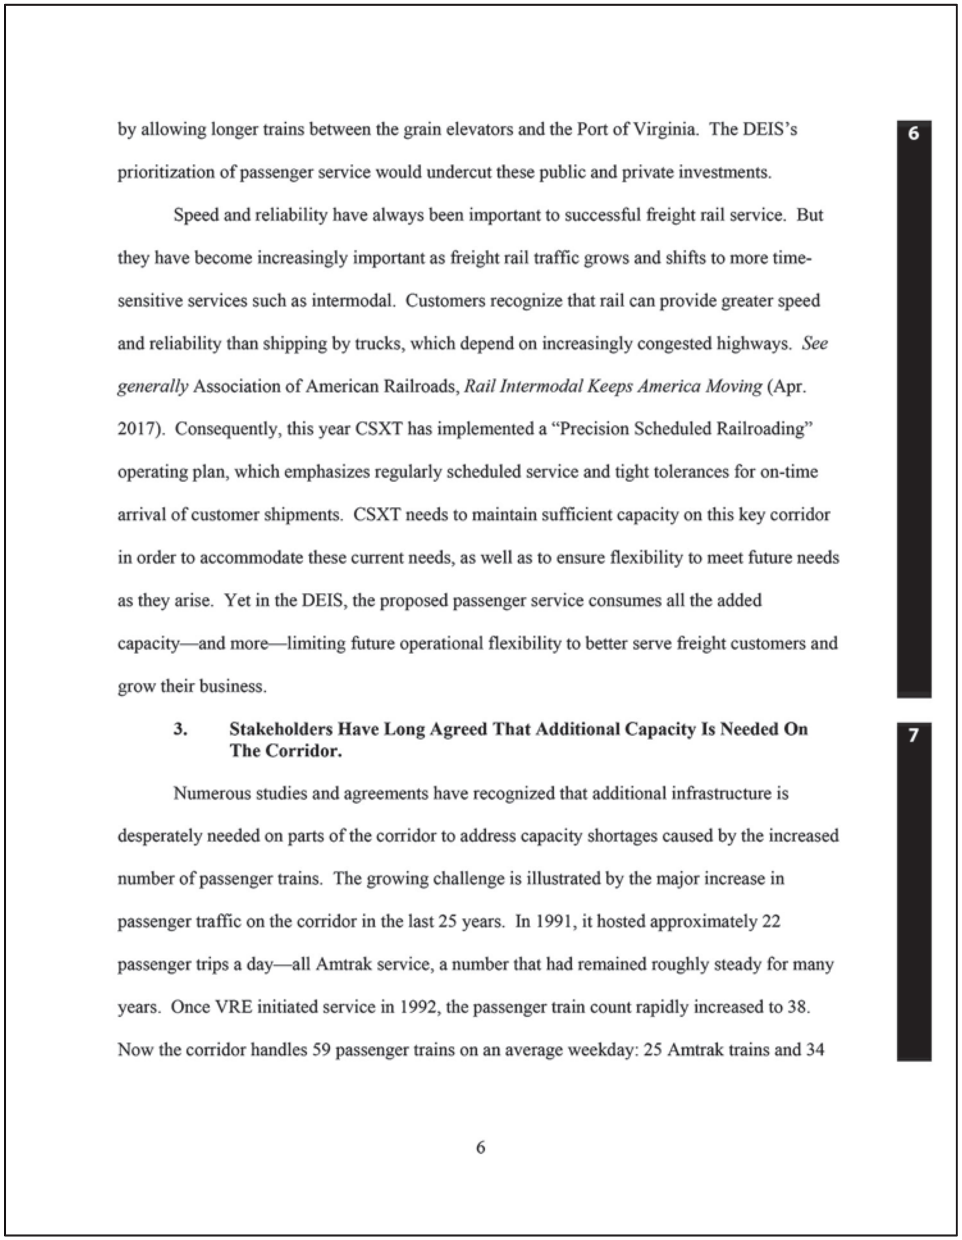
6

includes CSXT's Peninsula Subdivision which heads east from Richmond, and the Buckingham Branch Railroad (BBRR), a parallel north-south route connecting to the main line in Doswell and Richmond.

These lines, part of CSXT's I-95 Corridor and National Gateway, are a "critical" part of the broader CSXT network, which encompasses 21,000 miles of track across 23 states and the District of Columbia. DEIS App. A 3-9. To the south, the network continues on to southern Florida, along the way serving local industry as well as major ports in, among other cities, Hampton Roads; Wilmington, North Carolina; Charleston, South Carolina; Savannah, Georgia; Jacksonville, Florida; and Miami. To the north, the I-95 Corridor continues through Pennsylvania, New Jersey, New York and New England. That north-south route plays a "vital role in moving … rail freight for shippers in Virginia and along the entire eastern seaboard." DEIS 1-19.

The north-south lines also feed the east-west routes of the National Gateway, which provides the connection between the mid-Atlantic ports and Midwest consumption markets, serving customers throughout Ohio, Indiana, West Virginia, Kentucky and Tennessee. And with connections to other carriers in Chicago and other rail destinations, the network provides service to the west coast ports. The result is "the primary intermodal train corridor for CSXT connecting the Port of Virginia" and other mid-Atlantic ports "to national markets." DEIS 1-19; *see also id.* at 1-3 to 1-10.

The Commonwealth and CSXT are also jointly investing in a bypass of the Acca Yard in Richmond—an upgrade that will benefit both passenger and freight service. In another joint project with the Commonwealth, CSXT has enhanced service to Virginia industry with a new two-mile siding in Branchville, which supports expansion of the Chesapeake, VA Perdue facility



6

by allowing longer trains between the grain elevators and the Port of Virginia. The DEIS's prioritization of passenger service would undercut these public and private investments.

Speed and reliability have always been important to successful freight rail service. But they have become increasingly important as freight rail traffic grows and shifts to more time-sensitive services such as intermodal. Customers recognize that rail can provide greater speed and reliability than shipping by trucks, which depend on increasingly congested highways. *See generally* Association of American Railroads, *Rail Intermodal Keeps America Moving* (Apr. 2017). Consequently, this year CSXT has implemented a "Precision Scheduled Railroading" operating plan, which emphasizes regularly scheduled service and tight tolerances for on-time arrival of customer shipments. CSXT needs to maintain sufficient capacity on this key corridor in order to accommodate these current needs, as well as to ensure flexibility to meet future needs as they arise. Yet in the DEIS, the proposed passenger service consumes all the added capacity—and more—limiting future operational flexibility to better serve freight customers and grow their business.

7

3. Stakeholders Have Long Agreed That Additional Capacity Is Needed On The Corridor.

Numerous studies and agreements have recognized that additional infrastructure is desperately needed on parts of the corridor to address capacity shortages caused by the increased number of passenger trains. The growing challenge is illustrated by the major increase in passenger traffic on the corridor in the last 25 years. In 1991, it hosted approximately 22 passenger trips a day—all Amtrak service, a number that had remained roughly steady for many years. Once VRE initiated service in 1992, the passenger train count rapidly increased to 38. Now the corridor handles 59 passenger trains on an average weekday: 25 Amtrak trains and 34

6

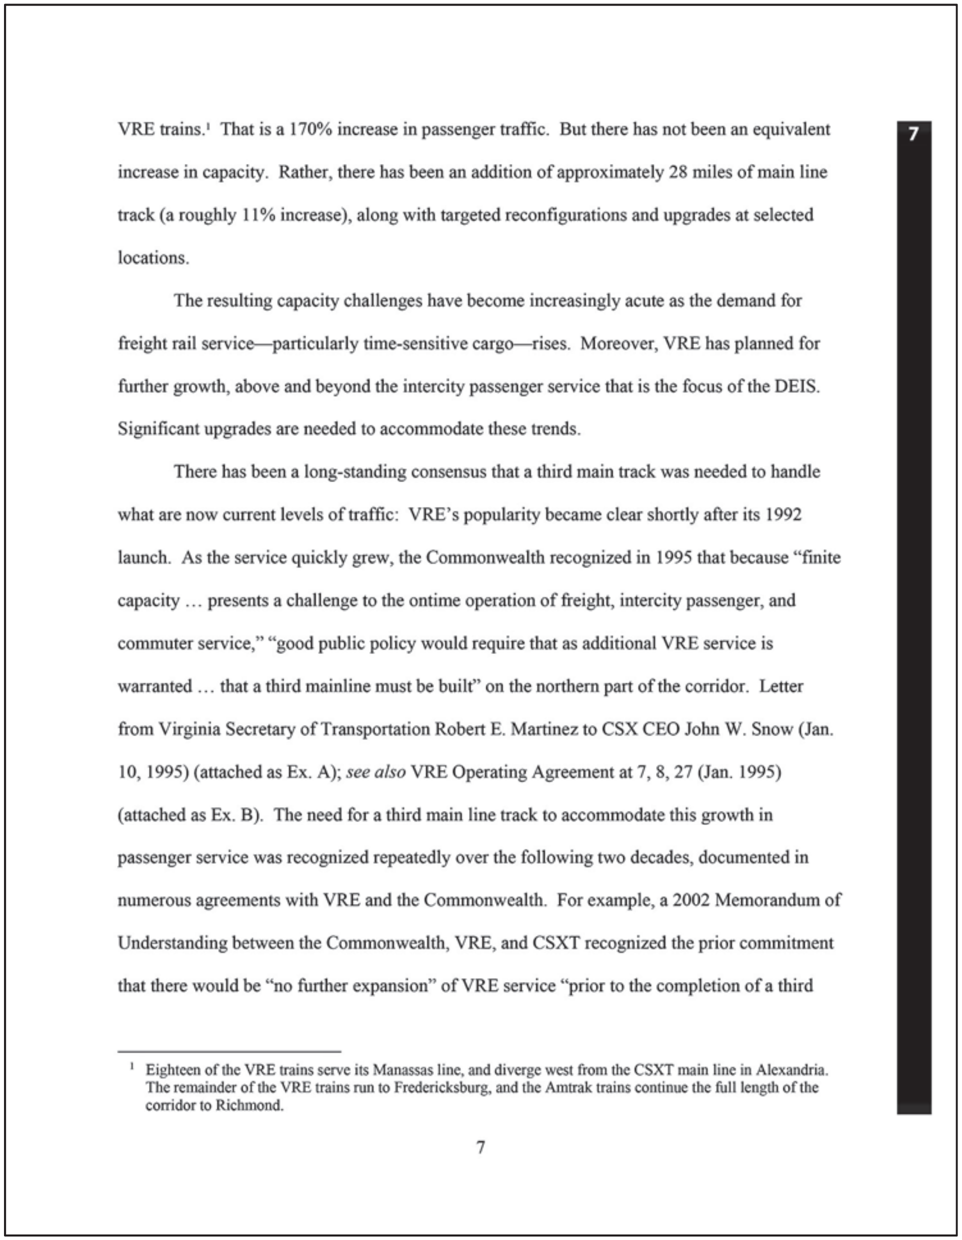
CSXT (continued)

(For response to comment 6, refer to page B-332)

7. DRPT agrees that additional rail capacity is needed on the corridor to accommodate proposed increases in passenger service, and through the years DRPT has worked closely with CSXT and VRE to construct additional track capacity in the corridor. DRPT looks forward to continuing close cooperation with CSXT on the DC2RVA Project and other projects in the rail corridor that may increase rail capacity to accommodate increased freight, passenger, and commuter rail service.

CSXT (continued)

(For response to comment 7, refer to page B-334)



7

VRE trains.[1] That is a 170% increase in passenger traffic. But there has not been an equivalent increase in capacity. Rather, there has been an addition of approximately 28 miles of main line track (a roughly 11% increase), along with targeted reconfigurations and upgrades at selected locations.

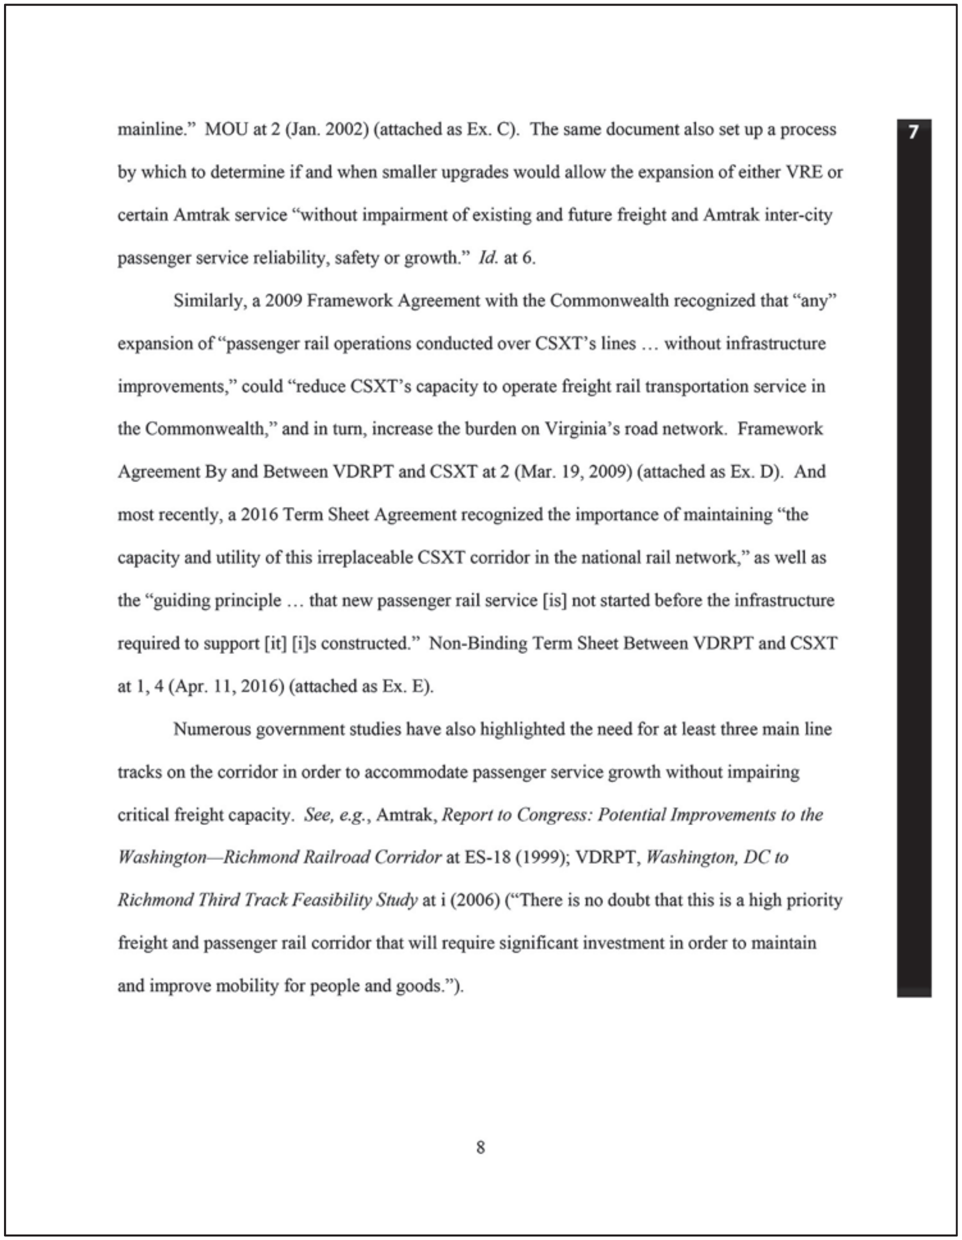
The resulting capacity challenges have become increasingly acute as the demand for freight rail service—particularly time-sensitive cargo—rises. Moreover, VRE has planned for further growth, above and beyond the intercity passenger service that is the focus of the DEIS. Significant upgrades are needed to accommodate these trends.

There has been a long-standing consensus that a third main track was needed to handle what are now current levels of traffic: VRE's popularity became clear shortly after its 1992 launch. As the service quickly grew, the Commonwealth recognized in 1995 that because "finite capacity … presents a challenge to the ontime operation of freight, intercity passenger, and commuter service," "good public policy would require that as additional VRE service is warranted … that a third mainline must be built" on the northern part of the corridor. Letter from Virginia Secretary of Transportation Robert E. Martinez to CSX CEO John W. Snow (Jan. 10, 1995) (attached as Ex. A); *see also* VRE Operating Agreement at 7, 8, 27 (Jan. 1995) (attached as Ex. B). The need for a third main line track to accommodate this growth in passenger service was recognized repeatedly over the following two decades, documented in numerous agreements with VRE and the Commonwealth. For example, a 2002 Memorandum of Understanding between the Commonwealth, VRE, and CSXT recognized the prior commitment that there would be "no further expansion" of VRE service "prior to the completion of a third

---

[1] Eighteen of the VRE trains serve its Manassas line, and diverge west from the CSXT main line in Alexandria. The remainder of the VRE trains run to Fredericksburg, and the Amtrak trains continue the full length of the corridor to Richmond.

7



7

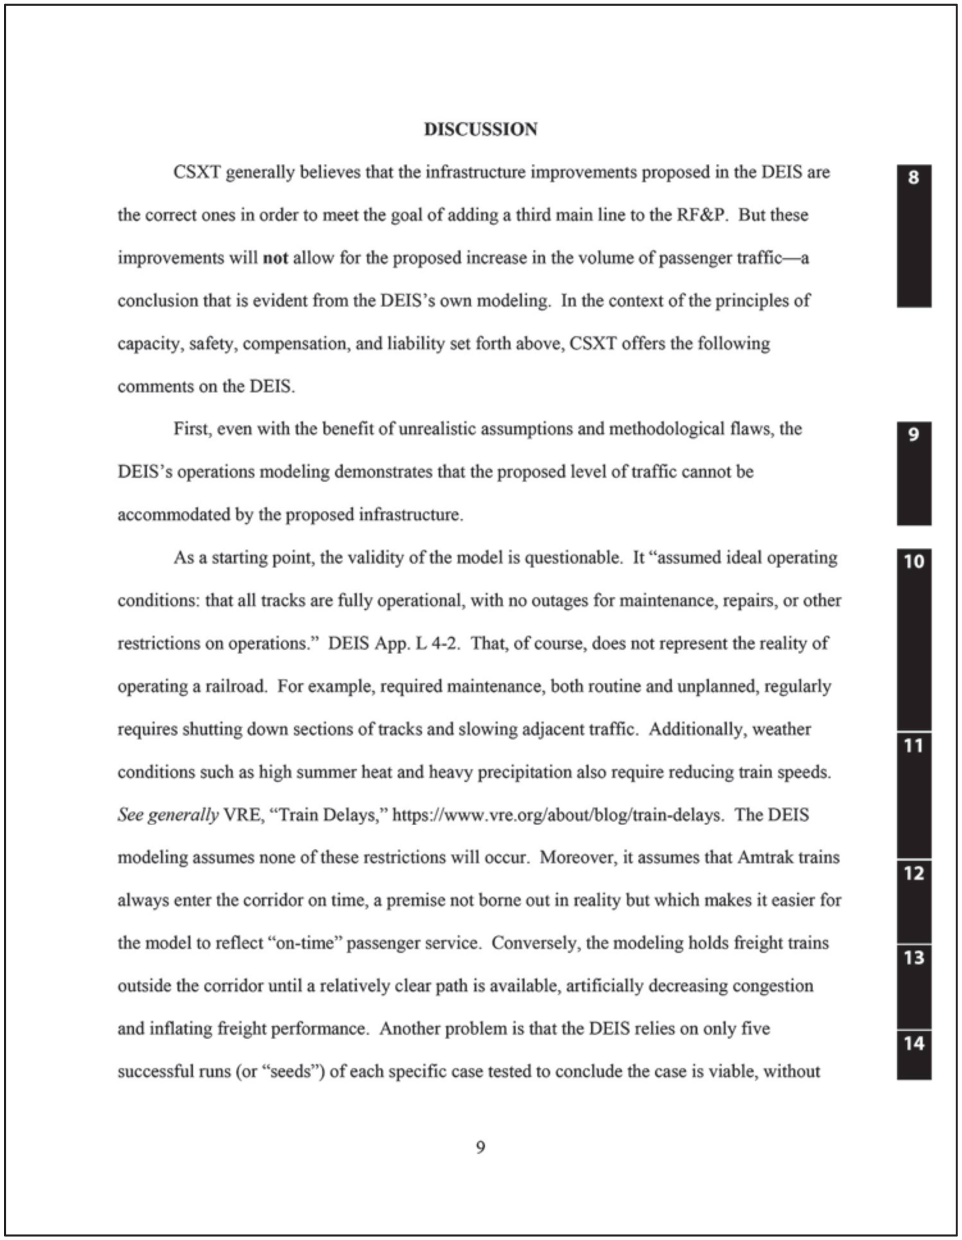
mainline." MOU at 2 (Jan. 2002) (attached as Ex. C). The same document also set up a process by which to determine if and when smaller upgrades would allow the expansion of either VRE or certain Amtrak service "without impairment of existing and future freight and Amtrak inter-city passenger service reliability, safety or growth." *Id.* at 6.

Similarly, a 2009 Framework Agreement with the Commonwealth recognized that "any" expansion of "passenger rail operations conducted over CSXT's lines … without infrastructure improvements," could "reduce CSXT's capacity to operate freight rail transportation service in the Commonwealth," and in turn, increase the burden on Virginia's road network. Framework Agreement By and Between VDRPT and CSXT at 2 (Mar. 19, 2009) (attached as Ex. D). And most recently, a 2016 Term Sheet Agreement recognized the importance of maintaining "the capacity and utility of this irreplaceable CSXT corridor in the national rail network," as well as the "guiding principle … that new passenger rail service [is] not started before the infrastructure required to support [it] [i]s constructed." Non-Binding Term Sheet Between VDRPT and CSXT at 1, 4 (Apr. 11, 2016) (attached as Ex. E).

Numerous government studies have also highlighted the need for at least three main line tracks on the corridor in order to accommodate passenger service growth without impairing critical freight capacity. *See, e.g.*, Amtrak, *Report to Congress: Potential Improvements to the Washington—Richmond Railroad Corridor* at ES-18 (1999); VDRPT, *Washington, DC to Richmond Third Track Feasibility Study* at i (2006) ("There is no doubt that this is a high priority freight and passenger rail corridor that will require significant investment in order to maintain and improve mobility for people and goods.").

CSXT (continued)

(For response to comment 7, refer to page B-334)



DISCUSSION

8 CSXT generally believes that the infrastructure improvements proposed in the DEIS are the correct ones in order to meet the goal of adding a third main line to the RF&P. But these improvements will **not** allow for the proposed increase in the volume of passenger traffic—a conclusion that is evident from the DEIS's own modeling. In the context of the principles of capacity, safety, compensation, and liability set forth above, CSXT offers the following comments on the DEIS.

9 First, even with the benefit of unrealistic assumptions and methodological flaws, the DEIS's operations modeling demonstrates that the proposed level of traffic cannot be accommodated by the proposed infrastructure.

10 As a starting point, the validity of the model is questionable. It "assumed ideal operating conditions: that all tracks are fully operational, with no outages for maintenance, repairs, or other restrictions on operations." DEIS App. L 4-2. That, of course, does not represent the reality of operating a railroad. For example, required maintenance, both routine and unplanned, regularly requires shutting down sections of tracks and slowing adjacent traffic. 11 Additionally, weather conditions such as high summer heat and heavy precipitation also require reducing train speeds. *See generally* VRE, "Train Delays," https://www.vre.org/about/blog/train-delays. The DEIS modeling assumes none of these restrictions will occur. 12 Moreover, it assumes that Amtrak trains always enter the corridor on time, a premise not borne out in reality but which makes it easier for the model to reflect "on-time" passenger service. 13 Conversely, the modeling holds freight trains outside the corridor until a relatively clear path is available, artificially decreasing congestion and inflating freight performance. 14 Another problem is that the DEIS relies on only five successful runs (or "seeds") of each specific case tested to conclude the case is viable, without

CSXT (continued)

8. Comment noted.

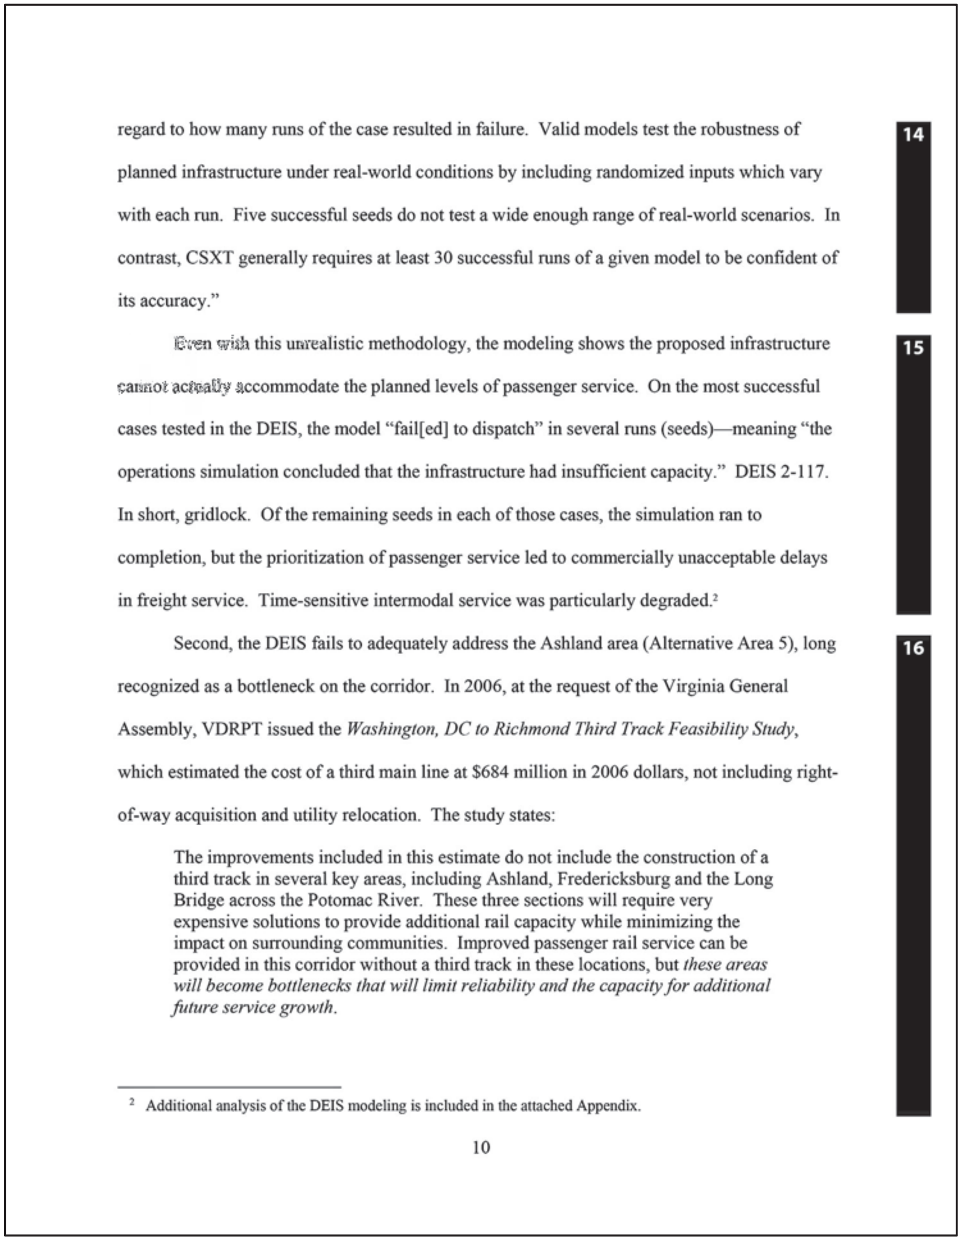
9. and 10. DRPT conducted additional modeling in coordination with FRA that included cases that simulated maintenance-of-way outages, which is summarized in Section 3.2 of the Final EIS and fully discussed in Appendix F of the Final EIS. DRPT is conducting additional Project modeling as part of the Corridor Service Development Plan (SDP) phase of the DC2RVA Project, which would include a review of modeling assumptions, cases, and inputs, as well as additional simulation with maintenance-of-way outages; refer to Section 7.3 of the Final EIS for description of the SDP.

11. See response to DRPT-numbered statement #9 and 10.

12. See response to DRPT-numbered statement #9 and 10.

13. See response to DRPT-numbered statement #9 and 10.

14. Comment noted.



14

regard to how many runs of the case resulted in failure. Valid models test the robustness of planned infrastructure under real-world conditions by including randomized inputs which vary with each run. Five successful seeds do not test a wide enough range of real-world scenarios. In contrast, CSXT generally requires at least 30 successful runs of a given model to be confident of its accuracy."

15

Even with this unrealistic methodology, the modeling shows the proposed infrastructure cannot actually accommodate the planned levels of passenger service. On the most successful cases tested in the DEIS, the model "fail[ed] to dispatch" in several runs (seeds)—meaning "the operations simulation concluded that the infrastructure had insufficient capacity." DEIS 2-117. In short, gridlock. Of the remaining seeds in each of those cases, the simulation ran to completion, but the prioritization of passenger service led to commercially unacceptable delays in freight service. Time-sensitive intermodal service was particularly degraded.[2]

16

Second, the DEIS fails to adequately address the Ashland area (Alternative Area 5), long recognized as a bottleneck on the corridor. In 2006, at the request of the Virginia General Assembly, VDRPT issued the *Washington, DC to Richmond Third Track Feasibility Study*, which estimated the cost of a third main line at $684 million in 2006 dollars, not including right-of-way acquisition and utility relocation. The study states:

> The improvements included in this estimate do not include the construction of a third track in several key areas, including Ashland, Fredericksburg and the Long Bridge across the Potomac River. These three sections will require very expensive solutions to provide additional rail capacity while minimizing the impact on surrounding communities. Improved passenger rail service can be provided in this corridor without a third track in these locations, but *these areas will become bottlenecks that will limit reliability and the capacity for additional future service growth*.

---

[2] Additional analysis of the DEIS modeling is included in the attached Appendix.

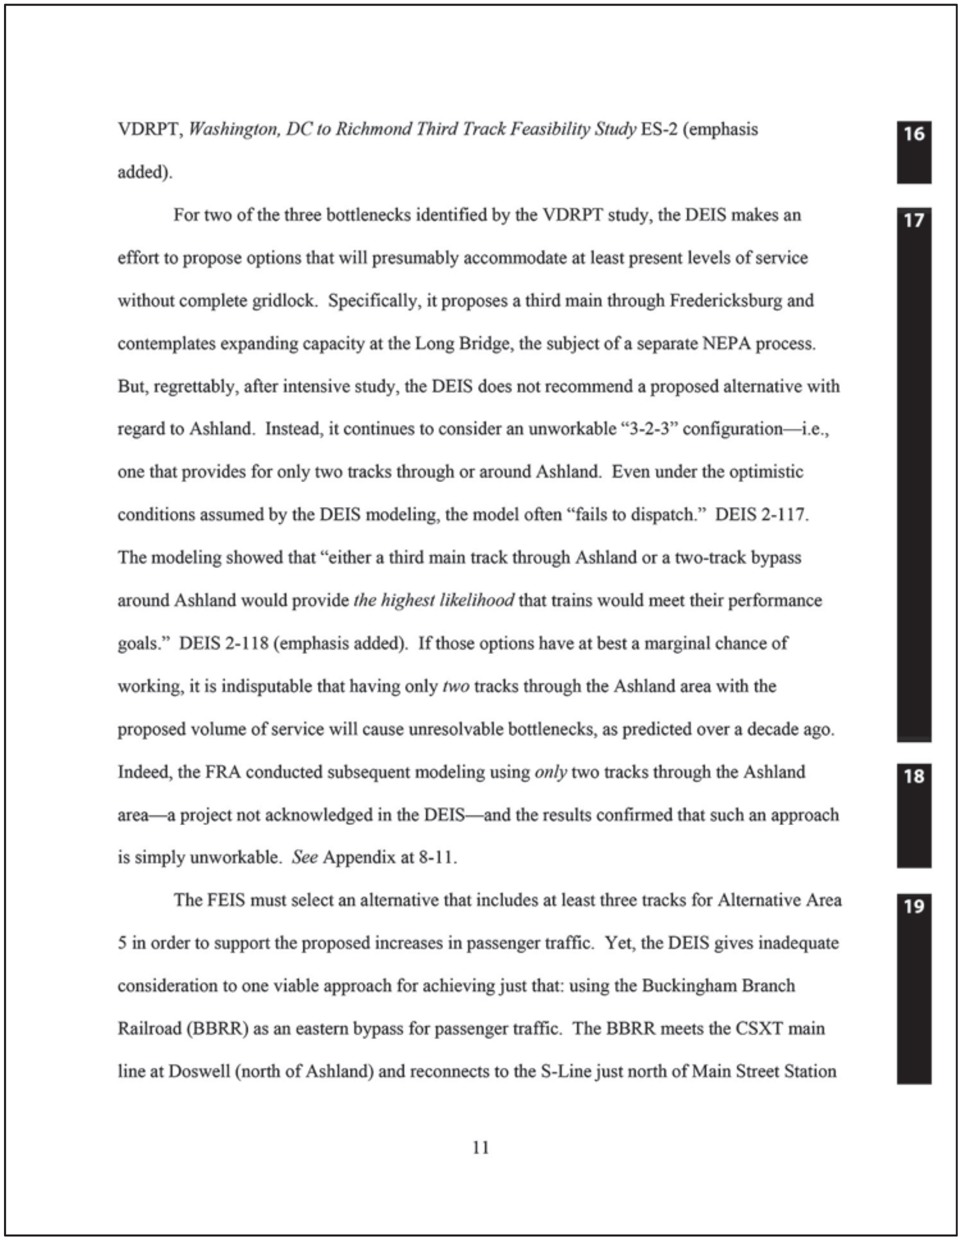
15. Comment noted.
16. Comment noted.



16 VDRPT, *Washington, DC to Richmond Third Track Feasibility Study* ES-2 (emphasis added).

17 For two of the three bottlenecks identified by the VDRPT study, the DEIS makes an effort to propose options that will presumably accommodate at least present levels of service without complete gridlock. Specifically, it proposes a third main through Fredericksburg and contemplates expanding capacity at the Long Bridge, the subject of a separate NEPA process. But, regrettably, after intensive study, the DEIS does not recommend a proposed alternative with regard to Ashland. Instead, it continues to consider an unworkable "3-2-3" configuration—i.e., one that provides for only two tracks through or around Ashland. Even under the optimistic conditions assumed by the DEIS modeling, the model often "fails to dispatch." DEIS 2-117. The modeling showed that "either a third main track through Ashland or a two-track bypass around Ashland would provide *the highest likelihood* that trains would meet their performance goals." DEIS 2-118 (emphasis added). If those options have at best a marginal chance of working, it is indisputable that having only *two* tracks through the Ashland area with the proposed volume of service will cause unresolvable bottlenecks, as predicted over a decade ago.

18 Indeed, the FRA conducted subsequent modeling using *only* two tracks through the Ashland area—a project not acknowledged in the DEIS—and the results confirmed that such an approach is simply unworkable. *See* Appendix at 8-11.

19 The FEIS must select an alternative that includes at least three tracks for Alternative Area 5 in order to support the proposed increases in passenger traffic. Yet, the DEIS gives inadequate consideration to one viable approach for achieving just that: using the Buckingham Branch Railroad (BBRR) as an eastern bypass for passenger traffic. The BBRR meets the CSXT main line at Doswell (north of Ashland) and reconnects to the S-Line just north of Main Street Station

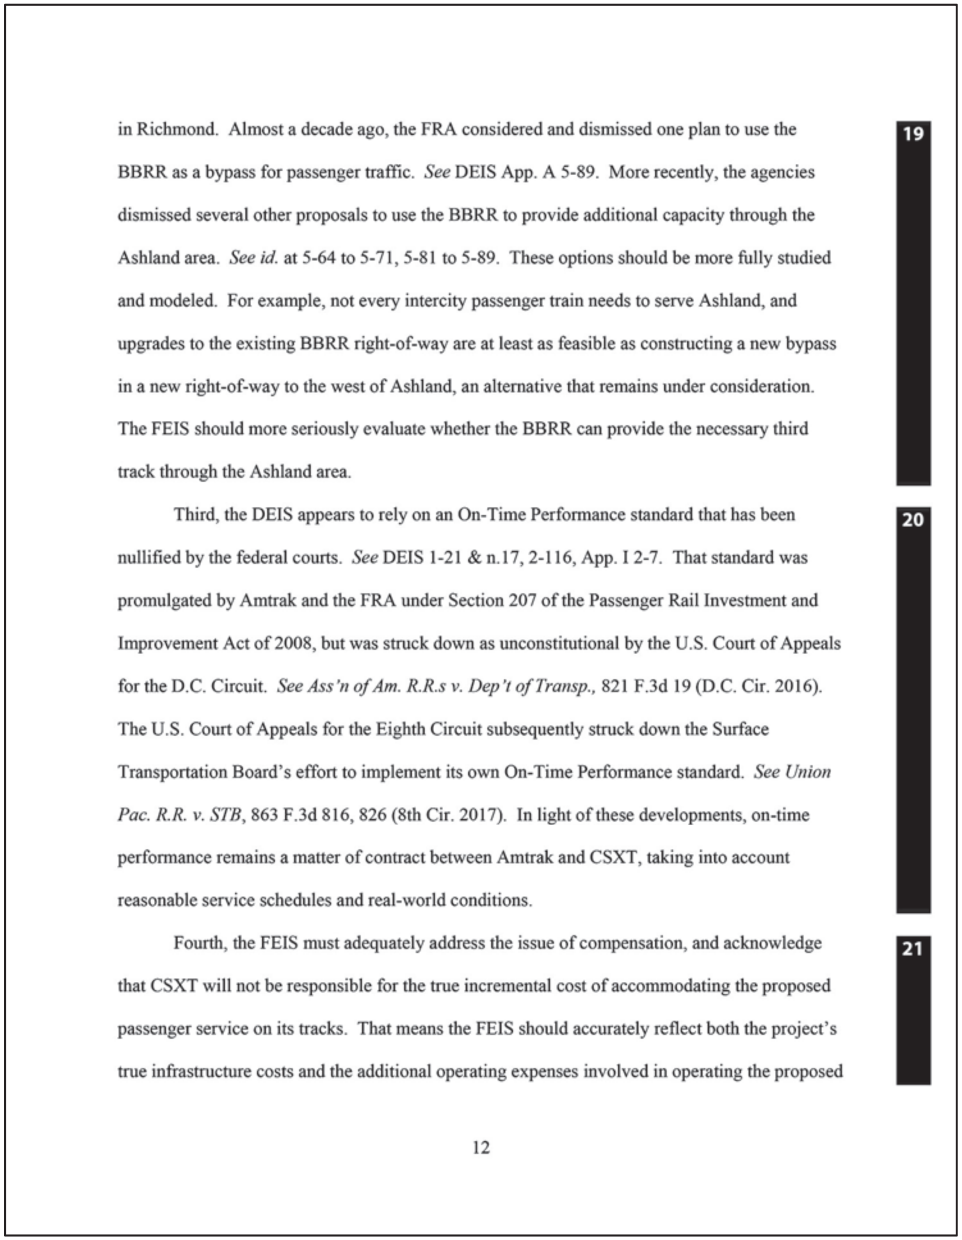
CSXT (continued)

(Response to comment 16 on previous page)

17. Comment noted.

18. As described in statements #9 and #10 above, DRPT conducted refined modeling that used only two tracks through the Ashland area subsequent to the Draft EIS preliminary simulation modeling; the findings of this effort are summarized in Section 3.2 of the Final EIS and fully discussed in Appendix I of the Final EIS. This additional operations analysis modeling confirmed that the range of alternatives evaluated in the Draft EIS, and selected as the Preferred Alternative in the Final EIS, were appropriate to accommodate the level of service proposed. DRPT and FRA note that the section of the Project in Area 5 through downtown Ashland is limited by existing physical, environmental, and historic conditions, which cannot be overcome without increased cost and impact to the community and environment. As services in the DC2RVA corridor are developed and implemented incrementally, DRPT looks forward to working with CSXT on future phases of the Project.

19. Comment noted. Analysis on the use of the Buckingham Branch as a freight bypass around Ashland is included in Appendix A of the Draft EIS. In addition, analysis of the use of the Buckingham Branch as a freight and passenger bypass around Ashland is included in Appendix G of the Final EIS, as part of the summary of the Town of Ashland / Hanover County Community Advisory Committee (CAC) activities. Routing certain passenger trains via the existing Buckingham Branch line from Richmond to Doswell would require skipping both the Staples Mill Road and Ashland stations, which would not meet the intercity passenger rail demand in the Project and thus would not meet the Purpose and Need of the Project.



19 in Richmond. Almost a decade ago, the FRA considered and dismissed one plan to use the BBRR as a bypass for passenger traffic. *See* DEIS App. A 5-89. More recently, the agencies dismissed several other proposals to use the BBRR to provide additional capacity through the Ashland area. *See id.* at 5-64 to 5-71, 5-81 to 5-89. These options should be more fully studied and modeled. For example, not every intercity passenger train needs to serve Ashland, and upgrades to the existing BBRR right-of-way are at least as feasible as constructing a new bypass in a new right-of-way to the west of Ashland, an alternative that remains under consideration. The FEIS should more seriously evaluate whether the BBRR can provide the necessary third track through the Ashland area.

20 Third, the DEIS appears to rely on an On-Time Performance standard that has been nullified by the federal courts. *See* DEIS 1-21 & n.17, 2-116, App. I 2-7. That standard was promulgated by Amtrak and the FRA under Section 207 of the Passenger Rail Investment and Improvement Act of 2008, but was struck down as unconstitutional by the U.S. Court of Appeals for the D.C. Circuit. *See Ass'n of Am. R.R.s v. Dep't of Transp.*, 821 F.3d 19 (D.C. Cir. 2016). The U.S. Court of Appeals for the Eighth Circuit subsequently struck down the Surface Transportation Board's effort to implement its own On-Time Performance standard. *See Union Pac. R.R. v. STB*, 863 F.3d 816, 826 (8th Cir. 2017). In light of these developments, on-time performance remains a matter of contract between Amtrak and CSXT, taking into account reasonable service schedules and real-world conditions.

21 Fourth, the FEIS must adequately address the issue of compensation, and acknowledge that CSXT will not be responsible for the true incremental cost of accommodating the proposed passenger service on its tracks. That means the FEIS should accurately reflect both the project's true infrastructure costs and the additional operating expenses involved in operating the proposed

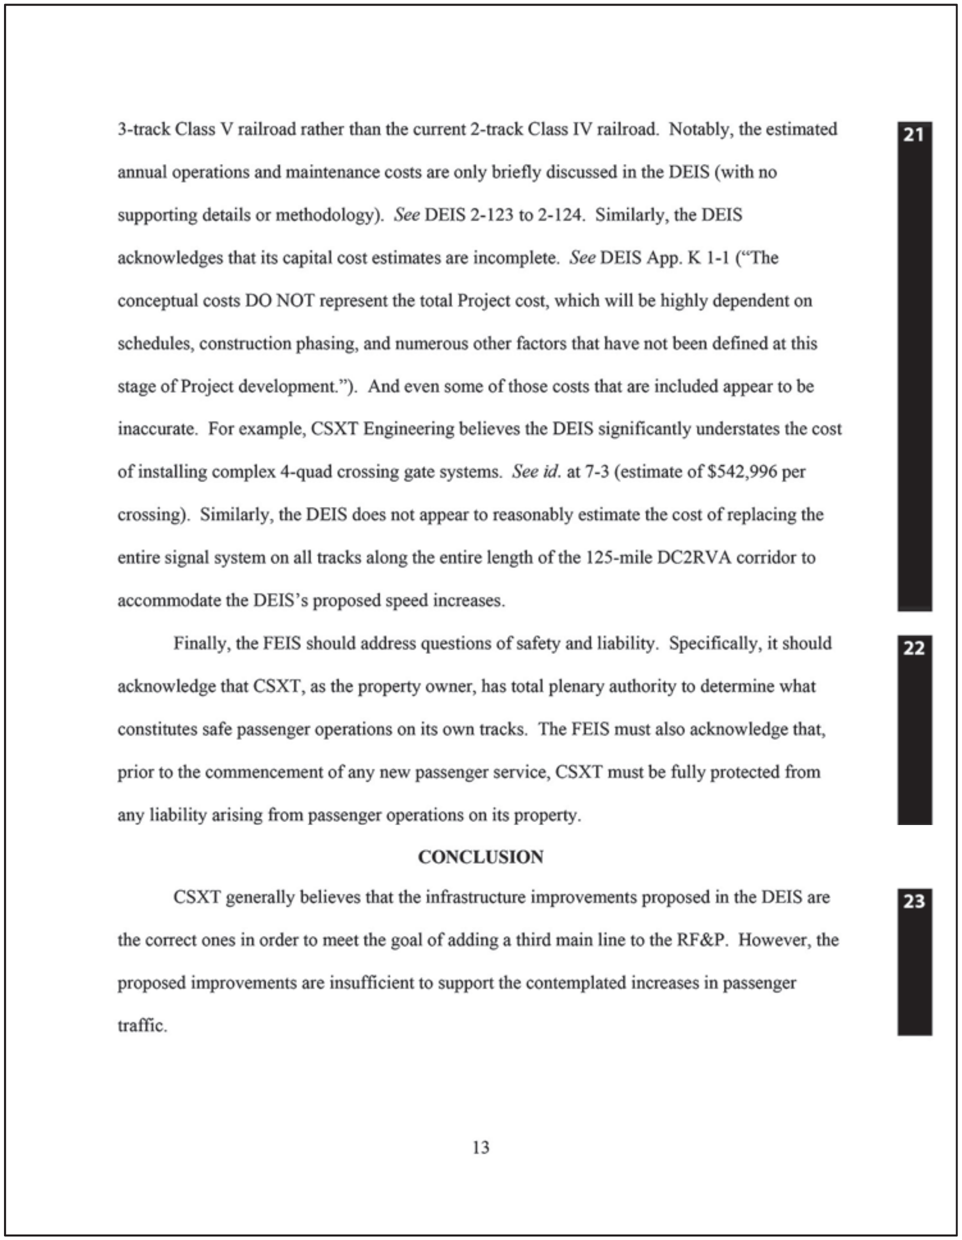
12

CSXT (continued)

(Response to comment 19 on previous page)

20. Comment noted.

21. The capital infrastructure cost estimates of the Preferred Alternative are summarized in Section 4.5 of the Final EIS. The estimates are based on conceptual engineering at an approximately 10% level of design using available desktop data. The purpose of the capital cost estimates is to provide a comparative cost between alternatives to assist environmental decisions to be made. Railroad signals and communications systems are estimated based on compared system costs from the California High Speed Rail project as part of the 10% conceptual engineering that was performed in support of the environmental documentation for this Project. Comparable cost information for railroad signals and communications systems was not available for inclusion in the Draft EIS due level of design at that phase. Appropriate order of magnitude cost estimates of the system were included in the capital costs estimates for comparative purposes only. These costs do not reflect refined actual costs based on a more detailed level of design, as noted by CSXT Engineering in their acknowledgement of the statement in Draft EIS Appendix K and in their assessment of crossing gate system costs.



21 3-track Class V railroad rather than the current 2-track Class IV railroad. Notably, the estimated annual operations and maintenance costs are only briefly discussed in the DEIS (with no supporting details or methodology). *See* DEIS 2-123 to 2-124. Similarly, the DEIS acknowledges that its capital cost estimates are incomplete. *See* DEIS App. K 1-1 ("The conceptual costs DO NOT represent the total Project cost, which will be highly dependent on schedules, construction phasing, and numerous other factors that have not been defined at this stage of Project development."). And even some of those costs that are included appear to be inaccurate. For example, CSXT Engineering believes the DEIS significantly understates the cost of installing complex 4-quad crossing gate systems. *See id.* at 7-3 (estimate of $542,996 per crossing). Similarly, the DEIS does not appear to reasonably estimate the cost of replacing the entire signal system on all tracks along the entire length of the 125-mile DC2RVA corridor to accommodate the DEIS's proposed speed increases.

22 Finally, the FEIS should address questions of safety and liability. Specifically, it should acknowledge that CSXT, as the property owner, has total plenary authority to determine what constitutes safe passenger operations on its own tracks. The FEIS must also acknowledge that, prior to the commencement of any new passenger service, CSXT must be fully protected from any liability arising from passenger operations on its property.

CONCLUSION

23 CSXT generally believes that the infrastructure improvements proposed in the DEIS are the correct ones in order to meet the goal of adding a third main line to the RF&P. However, the proposed improvements are insufficient to support the contemplated increases in passenger traffic.

13

CSXT (continued)

(Response to comment 21 on previous page)

22. DRPT acknowledges that CSXT, as the property owner of the DC2RVA corridor, has total plenary authority to determine what constitutes safe passenger operations on its own tracks in accordance with safety regulations governing passenger operations enacted by FRA.

23. As services in the DC2RVA corridor are developed and implemented incrementally, DRPT looks forward to working with CSXT on future phases of the Project, which includes a Corridor Service Development Plan (SDP) to incrementally implement the service improvements planned in the DC2RVA Project. As part of the SDP effort (see Section 7.3 of the Final EIS), DRPT will prepare additional operations analysis to help define the infrastructure required to deliver phased intercity passenger rail service growth through the 2045 Build Alternative. DRPT and FRA recognize that future operations analysis may suggest modifications to the infrastructure or the proposed operating plan beyond that presented in the EIS. Should potential modifications include a significant increase in environmental impacts or a reduction in the benefits presented in the EIS, a supplemental NEPA analysis may be required, as applicable under current or future NEPA regulations.

    Separate from the Purpose and Need of the DC2RVA Project, DRPT and FRA also recognize that CSXT, VRE, or other Project stakeholders may pursue additional capital improvements along the DC2RVA Corridor between Centralia and Washington, D.C., or on the adjacent railroad network. Additional operations analysis performed as part of the SDP, or in subsequent iterations through the life of the DC2RVA Project, will need to include the modifications to the railroad network constructed by others to continue to estimate that the infrastructure defined in the EIS for the DC2RVA Project remains effective to meet the Purpose and Need of the Project.

CSXT (continued)

3-track Class V railroad rather than the current 2-track Class IV railroad. Notably, the estimated annual operations and maintenance costs are only briefly discussed in the DEIS (with no supporting details or methodology). *See* DEIS 2-123 to 2-124. Similarly, the DEIS acknowledges that its capital cost estimates are incomplete. *See* DEIS App. K 1-1 ("The conceptual costs DO NOT represent the total Project cost, which will be highly dependent on schedules, construction phasing, and numerous other factors that have not been defined at this stage of Project development."). And even some of those costs that are included appear to be inaccurate. For example, CSXT Engineering believes the DEIS significantly understates the cost of installing complex 4-quad crossing gate systems. *See id.* at 7-3 (estimate of $542,996 per crossing). Similarly, the DEIS does not appear to reasonably estimate the cost of replacing the entire signal system on all tracks along the entire length of the 125-mile DC2RVA corridor to accommodate the DEIS's proposed speed increases. 21

Finally, the FEIS should address questions of safety and liability. Specifically, it should acknowledge that CSXT, as the property owner, has total plenary authority to determine what constitutes safe passenger operations on its own tracks. The FEIS must also acknowledge that, prior to the commencement of any new passenger service, CSXT must be fully protected from any liability arising from passenger operations on its property. 22

CONCLUSION

CSXT generally believes that the infrastructure improvements proposed in the DEIS are the correct ones in order to meet the goal of adding a third main line to the RF&P. However, the proposed improvements are insufficient to support the contemplated increases in passenger traffic. 23

As summarized in Section 3.2 of the Final EIS, DRPT conducted refined operations analysis both within the DC2RVA corridor as well as in the larger CSXT network, to inform the selection of a Preferred Alternative. It builds on previous operations simulation modeling conducted during preparation of the Draft EIS and incorporates subsequent revisions to the infrastructure and operating plans presented in the Draft EIS that were developed to improve operational consistency and reduce delays associated with schedule conflicts within the DC2RVA corridor. Full details of the refined operations analysis modeling are provided in the technical memos in Appendix F of the Final EIS; description of how the refined operations analysis modeling led to the selection of a Preferred Alternative is provided in the DC2RVA Recommendation Report, which is Appendix I of the Final EIS. DRPT has presented this and related service planning information to CSX on June 5 and 9, 2017; June 27 and 28, 2017; July 7 and 12, 2017; August 16, 2017; and September 18, 2017.

Comments:

Dear Mr. Snow:

The Virginia Railway Express and CSXT will soon sign an agreement extending commuter rail service in Northern Virginia for four and a half more years. The Commonwealth of Virginia is committed to support of passenger rail transportation as detailed in this letter. First and foremost, the Commonwealth respects the rights of CSX Corporation to operate its facilities for the benefit of its stockholders. The freight transportation services provided in the Commonwealth are critical to Virginia's economy and are a contributor to our continued economic growth. Our support of passenger rail service is in no way intended to disrupt the ability of CSXT to operate an efficient freight rail service. I believe you appreciate the position I held regarding this matter throughout the period of the CSX/VRE discussions.

In support of the current contract, the Commonwealth Transportation Board, for the current year, has appropriated capital funds necessary to pay the capital lease payments due to CSXT for the use of its transportation corridor and for construction of certain improvements necessary to accommodate increased VRE service. The Board is unable to appropriate subsequent years' funding due to legal restrictions. However, the Board did pass a resolution expressing its intent to continue funding VRE for the full term of its contract with CSXT. As Chairman, it is my intent to see that this commitment is met.

The finite capacity of the current track system in the Washington to Fredericksburg corridor presents a challenge to the ontime operation of freight, intercity passenger, and commuter service. We certainly recognize that additional capacity will be needed to accommodate future growth , and think good public policy would require that as additional VRE service is warranted by the market that a third mainline must be built between Washington and Fredericksburg. Towards that end, this administration will work diligently and cooperatively with CSX Corporation and the Virginia Railway Express first to ascertain market need and assess this approach and then seek to secure federal and state funding. We look forward to working with you.

CSX Corporation has a responsibility to its shareholders, customers, and employees to create value through providing freight transportation services. We recognize the importance of this service to the economic vitality of the Commonwealth. Similarly there is a public need to increase rail passenger service. We appreciate the accommodations CSXT has made to serve this public purpose by accommodating VRE's service. I pledge to work with you to make sure the future rail passenger service will not disrupt the operation of the rail freight network.

Sincerely,

Robert E. Martinez

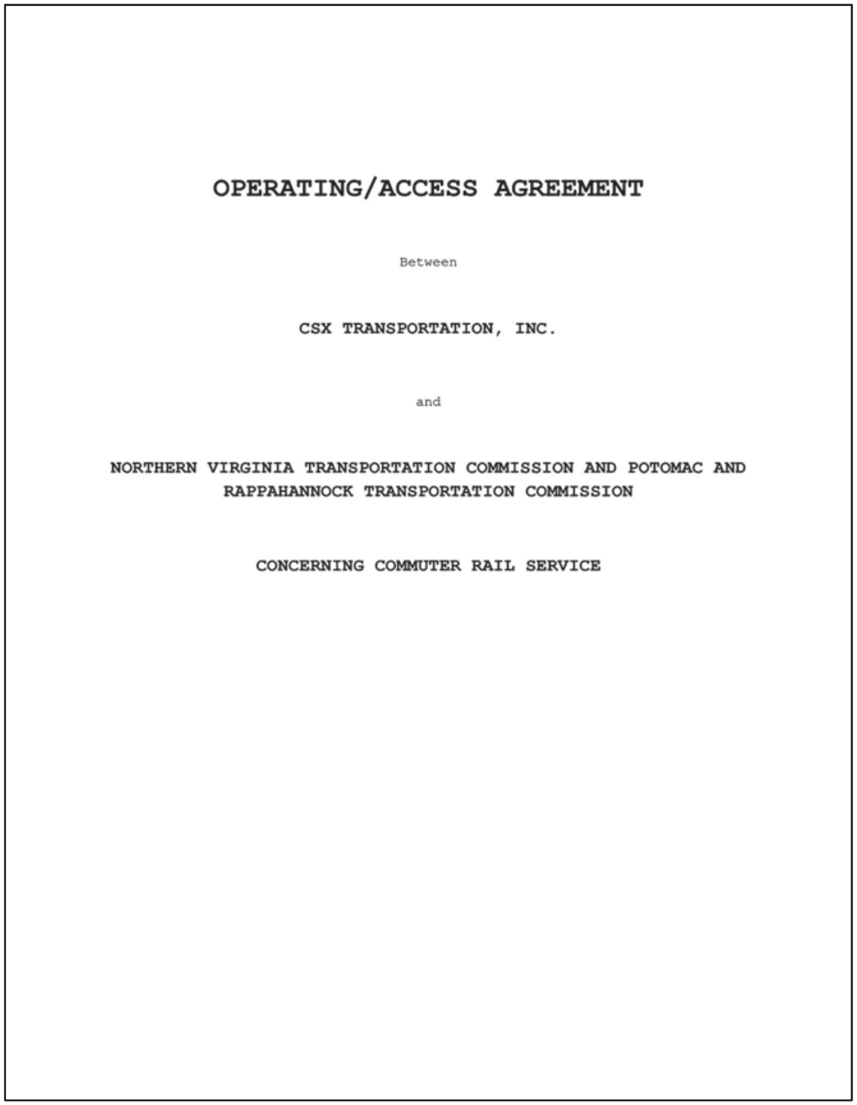
EXHIBIT B

CSXT (continued)



OPERATING/ACCESS AGREEMENT

Between

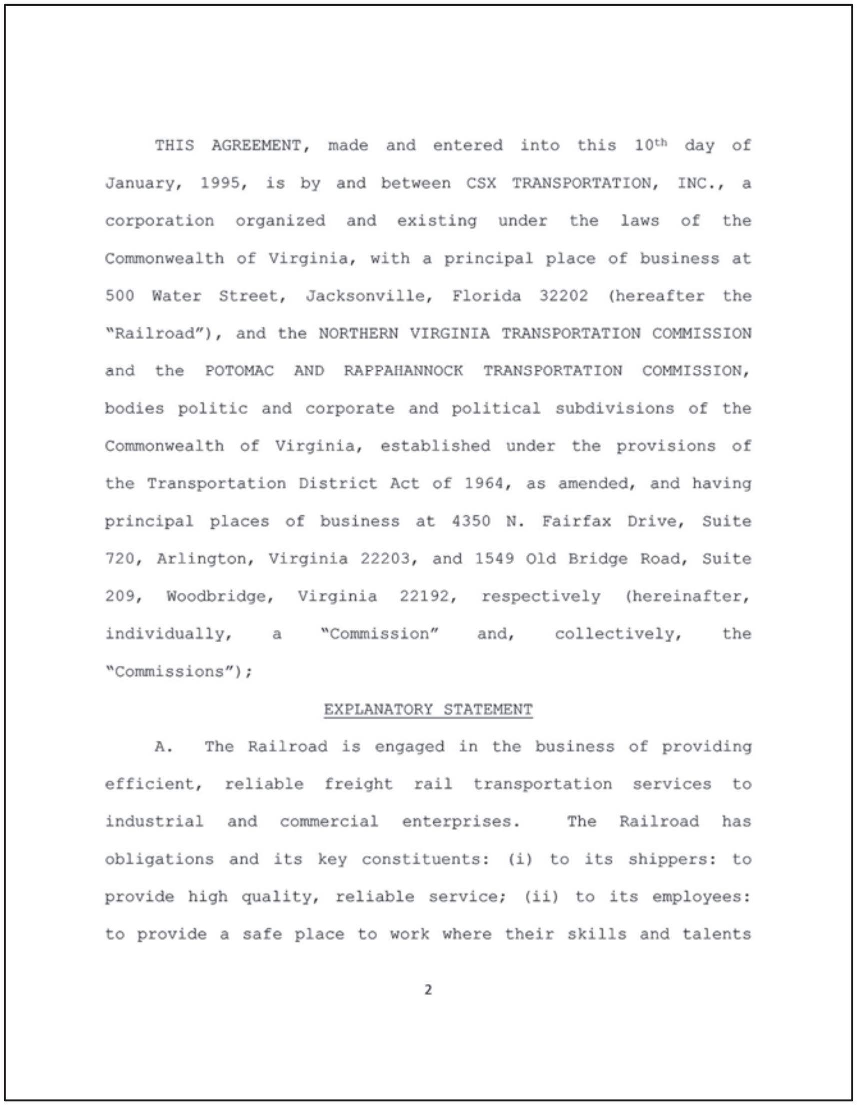
CSX TRANSPORTATION, INC.

and

NORTHERN VIRGINIA TRANSPORTATION COMMISSION AND POTOMAC AND RAPPAHANNOCK TRANSPORTATION COMMISSION

CONCERNING COMMUTER RAIL SERVICE

CSXT (continued)



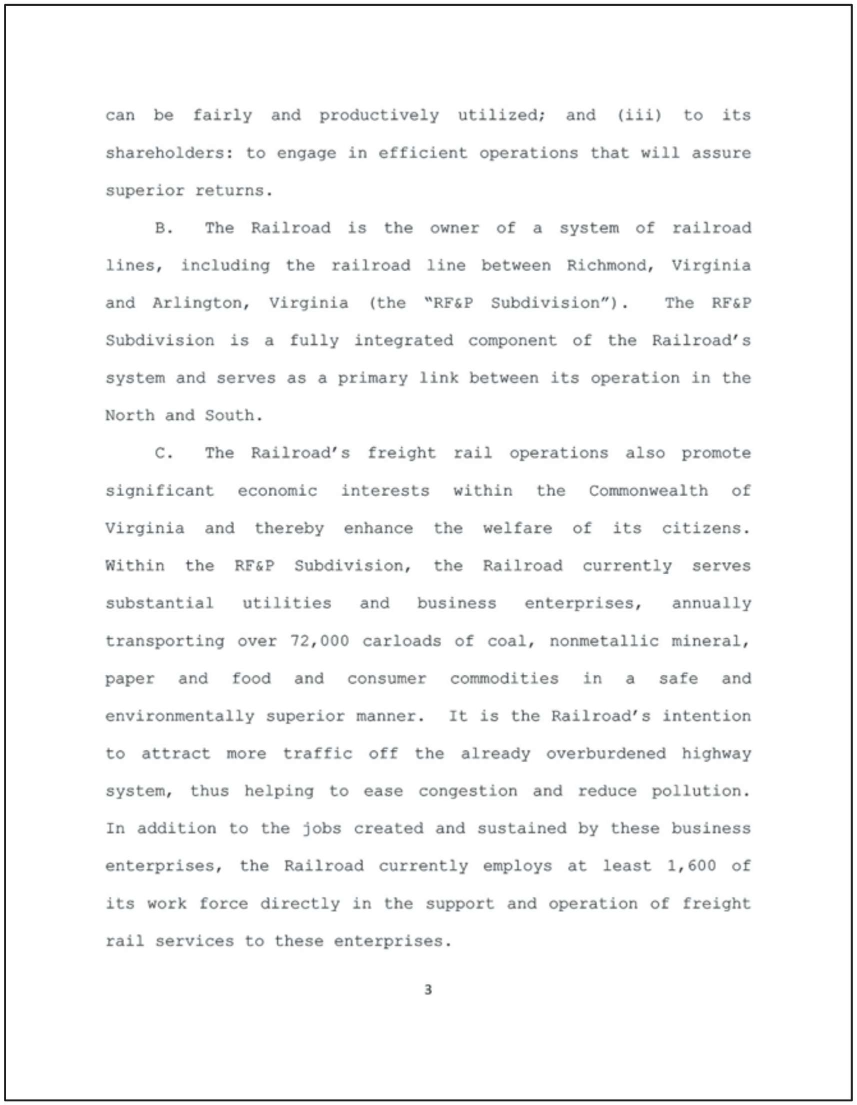
THIS AGREEMENT, made and entered into this 10th day of January, 1995, is by and between CSX TRANSPORTATION, INC., a corporation organized and existing under the laws of the Commonwealth of Virginia, with a principal place of business at 500 Water Street, Jacksonville, Florida 32202 (hereafter the "Railroad"), and the NORTHERN VIRGINIA TRANSPORTATION COMMISSION and the POTOMAC AND RAPPAHANNOCK TRANSPORTATION COMMISSION, bodies politic and corporate and political subdivisions of the Commonwealth of Virginia, established under the provisions of the Transportation District Act of 1964, as amended, and having principal places of business at 4350 N. Fairfax Drive, Suite 720, Arlington, Virginia 22203, and 1549 Old Bridge Road, Suite 209, Woodbridge, Virginia 22192, respectively (hereinafter, individually, a "Commission" and, collectively, the "Commissions");

EXPLANATORY STATEMENT

A. The Railroad is engaged in the business of providing efficient, reliable freight rail transportation services to industrial and commercial enterprises. The Railroad has obligations and its key constituents: (i) to its shippers: to provide high quality, reliable service; (ii) to its employees: to provide a safe place to work where their skills and talents

2

CSXT (continued)

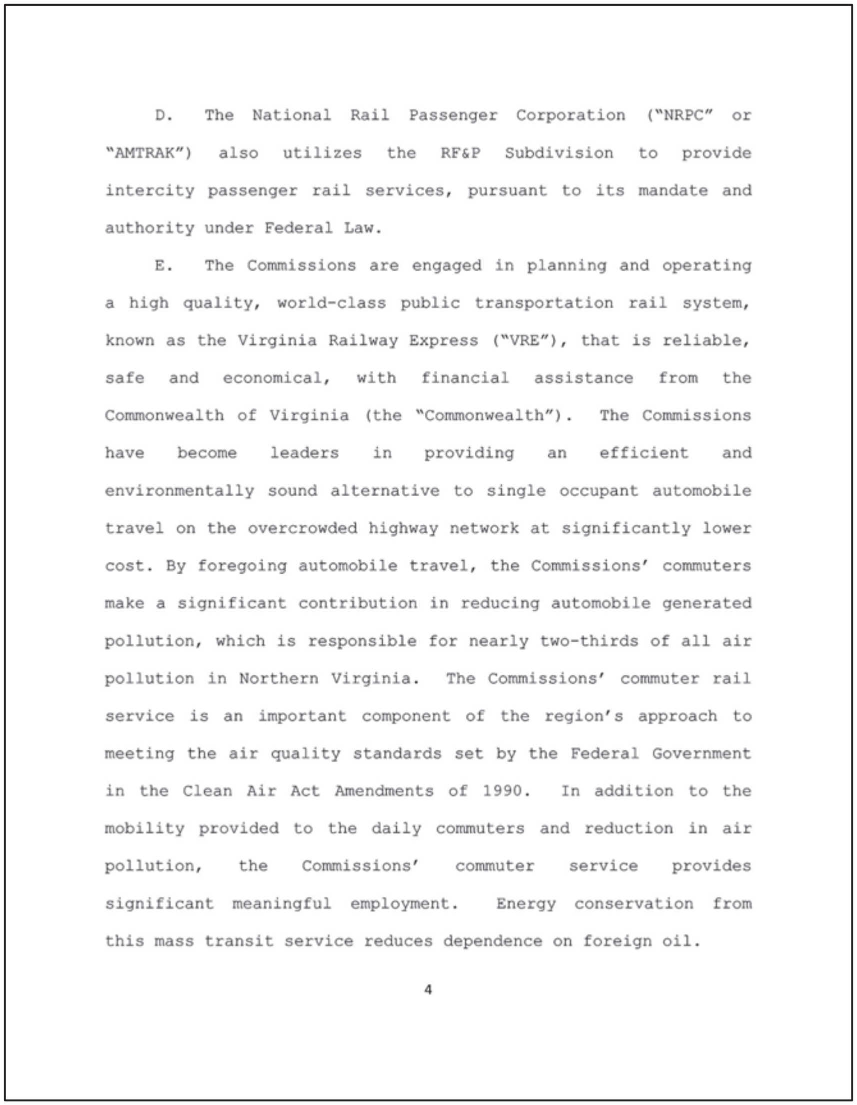


can be fairly and productively utilized; and (iii) to its shareholders: to engage in efficient operations that will assure superior returns.

B. The Railroad is the owner of a system of railroad lines, including the railroad line between Richmond, Virginia and Arlington, Virginia (the "RF&P Subdivision"). The RF&P Subdivision is a fully integrated component of the Railroad's system and serves as a primary link between its operation in the North and South.

C. The Railroad's freight rail operations also promote significant economic interests within the Commonwealth of Virginia and thereby enhance the welfare of its citizens. Within the RF&P Subdivision, the Railroad currently serves substantial utilities and business enterprises, annually transporting over 72,000 carloads of coal, nonmetallic mineral, paper and food and consumer commodities in a safe and environmentally superior manner. It is the Railroad's intention to attract more traffic off the already overburdened highway system, thus helping to ease congestion and reduce pollution. In addition to the jobs created and sustained by these business enterprises, the Railroad currently employs at least 1,600 of its work force directly in the support and operation of freight rail services to these enterprises.

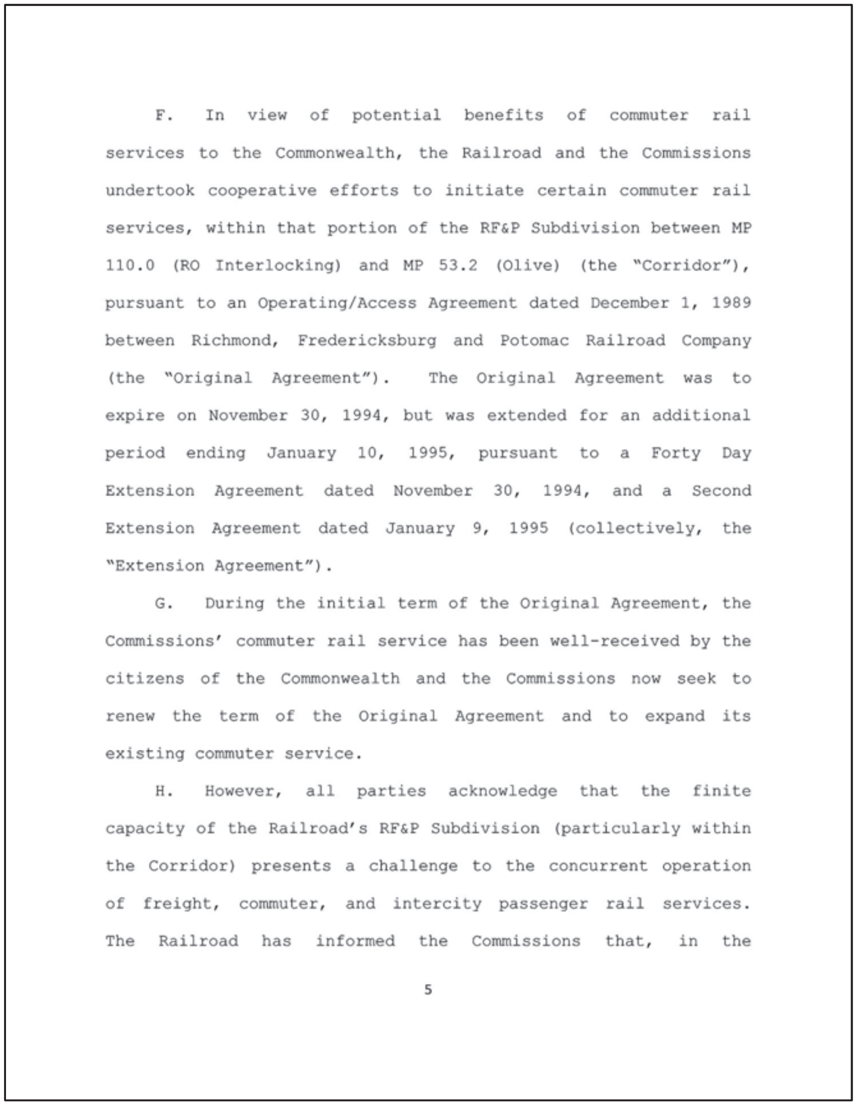
CSXT (continued)



D. The National Rail Passenger Corporation ("NRPC" or "AMTRAK") also utilizes the RF&P Subdivision to provide intercity passenger rail services, pursuant to its mandate and authority under Federal Law.

E. The Commissions are engaged in planning and operating a high quality, world-class public transportation rail system, known as the Virginia Railway Express ("VRE"), that is reliable, safe and economical, with financial assistance from the Commonwealth of Virginia (the "Commonwealth"). The Commissions have become leaders in providing an efficient and environmentally sound alternative to single occupant automobile travel on the overcrowded highway network at significantly lower cost. By foregoing automobile travel, the Commissions' commuters make a significant contribution in reducing automobile generated pollution, which is responsible for nearly two-thirds of all air pollution in Northern Virginia. The Commissions' commuter rail service is an important component of the region's approach to meeting the air quality standards set by the Federal Government in the Clean Air Act Amendments of 1990. In addition to the mobility provided to the daily commuters and reduction in air pollution, the Commissions' commuter service provides significant meaningful employment. Energy conservation from this mass transit service reduces dependence on foreign oil.

CSXT (continued)

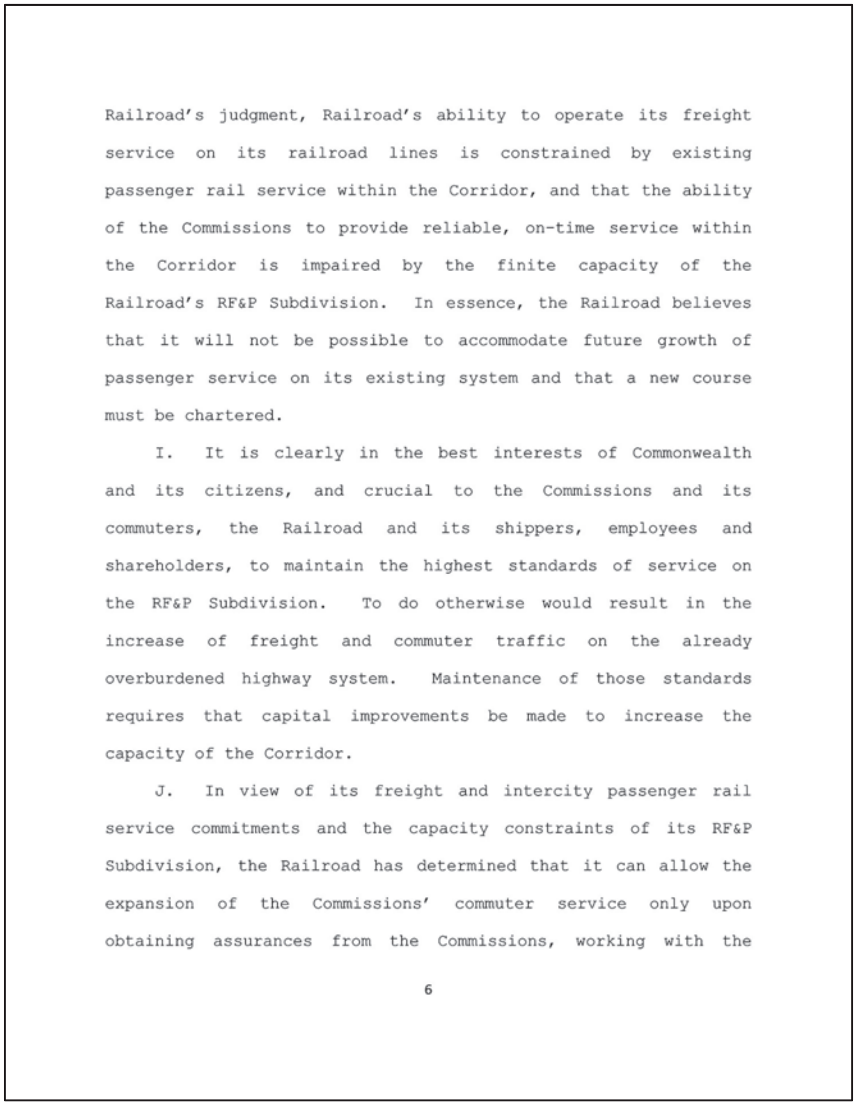


F. In view of potential benefits of commuter rail services to the Commonwealth, the Railroad and the Commissions undertook cooperative efforts to initiate certain commuter rail services, within that portion of the RF&P Subdivision between MP 110.0 (RO Interlocking) and MP 53.2 (Olive) (the "Corridor"), pursuant to an Operating/Access Agreement dated December 1, 1989 between Richmond, Fredericksburg and Potomac Railroad Company (the "Original Agreement"). The Original Agreement was to expire on November 30, 1994, but was extended for an additional period ending January 10, 1995, pursuant to a Forty Day Extension Agreement dated November 30, 1994, and a Second Extension Agreement dated January 9, 1995 (collectively, the "Extension Agreement").

G. During the initial term of the Original Agreement, the Commissions' commuter rail service has been well-received by the citizens of the Commonwealth and the Commissions now seek to renew the term of the Original Agreement and to expand its existing commuter service.

H. However, all parties acknowledge that the finite capacity of the Railroad's RF&P Subdivision (particularly within the Corridor) presents a challenge to the concurrent operation of freight, commuter, and intercity passenger rail services. The Railroad has informed the Commissions that, in the

CSXT (continued)

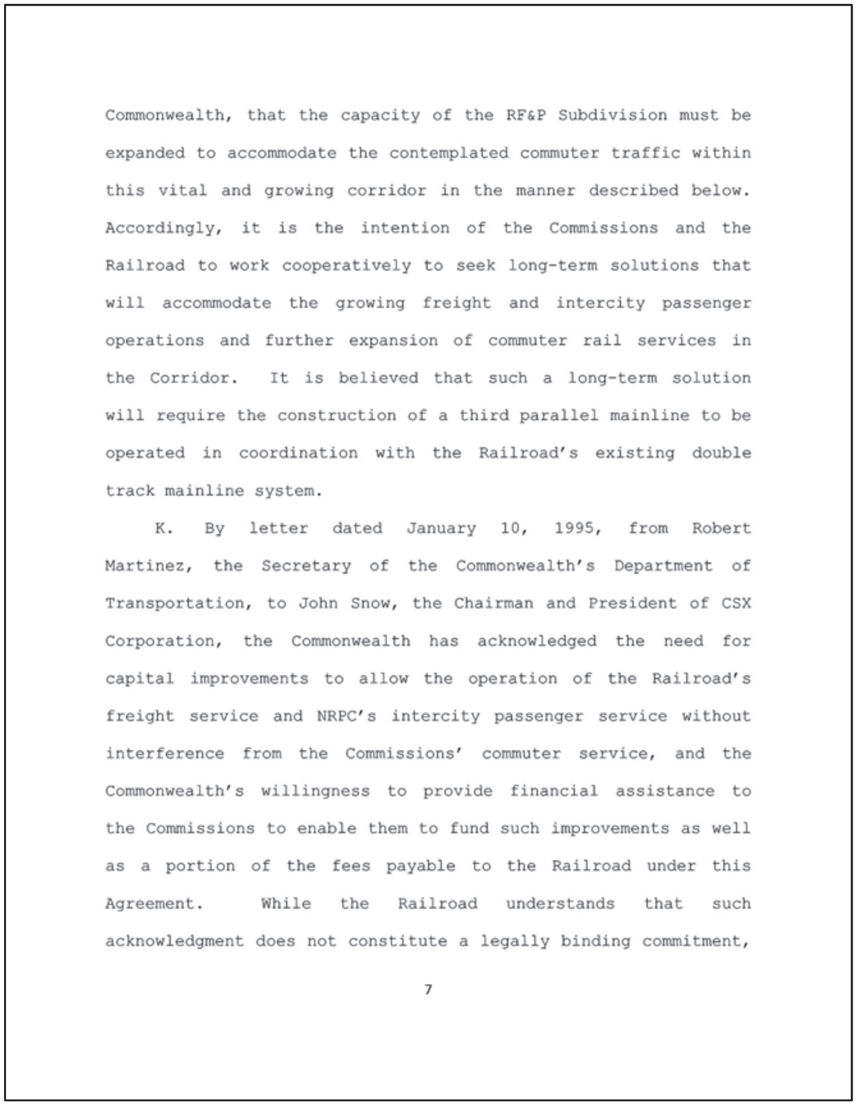


Railroad's judgment, Railroad's ability to operate its freight service on its railroad lines is constrained by existing passenger rail service within the Corridor, and that the ability of the Commissions to provide reliable, on-time service within the Corridor is impaired by the finite capacity of the Railroad's RF&P Subdivision. In essence, the Railroad believes that it will not be possible to accommodate future growth of passenger service on its existing system and that a new course must be chartered.

I. It is clearly in the best interests of Commonwealth and its citizens, and crucial to the Commissions and its commuters, the Railroad and its shippers, employees and shareholders, to maintain the highest standards of service on the RF&P Subdivision. To do otherwise would result in the increase of freight and commuter traffic on the already overburdened highway system. Maintenance of those standards requires that capital improvements be made to increase the capacity of the Corridor.

J. In view of its freight and intercity passenger rail service commitments and the capacity constraints of its RF&P Subdivision, the Railroad has determined that it can allow the expansion of the Commissions' commuter service only upon obtaining assurances from the Commissions, working with the

CSXT (continued)

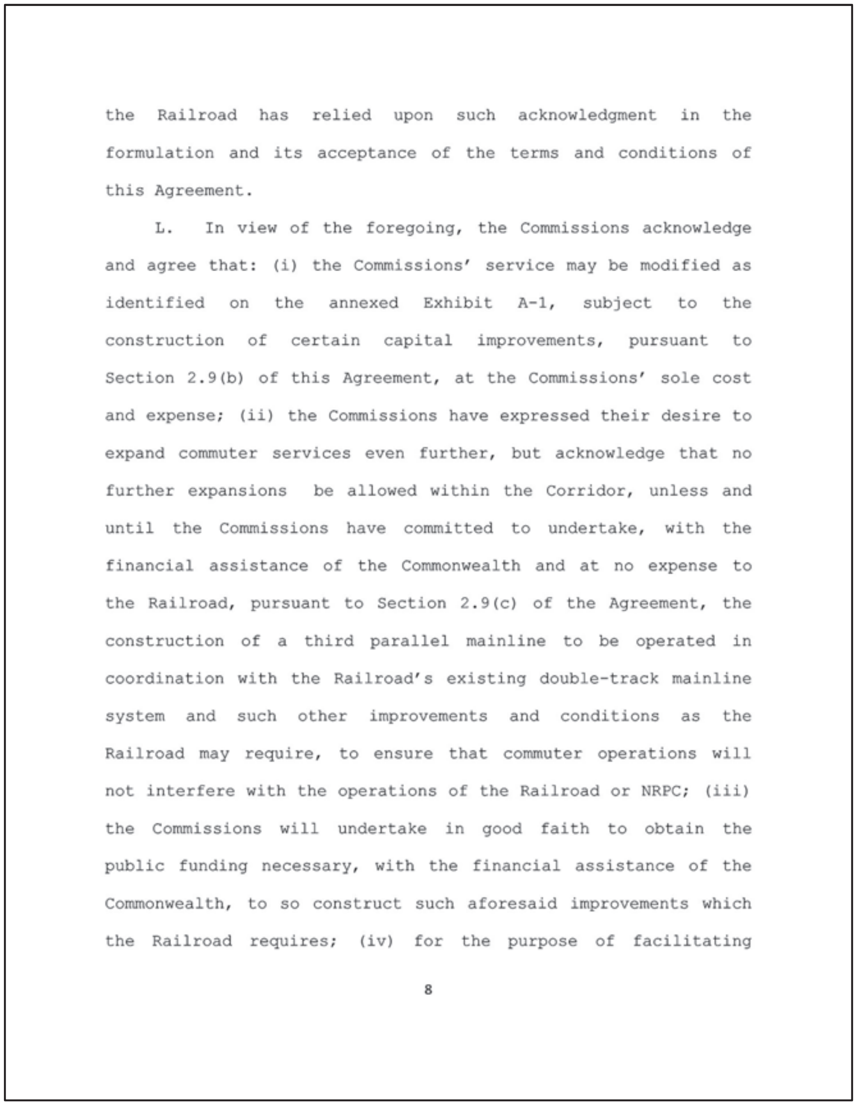


Commonwealth, that the capacity of the RF&P Subdivision must be expanded to accommodate the contemplated commuter traffic within this vital and growing corridor in the manner described below. Accordingly, it is the intention of the Commissions and the Railroad to work cooperatively to seek long-term solutions that will accommodate the growing freight and intercity passenger operations and further expansion of commuter rail services in the Corridor. It is believed that such a long-term solution will require the construction of a third parallel mainline to be operated in coordination with the Railroad's existing double track mainline system.

K. By letter dated January 10, 1995, from Robert Martinez, the Secretary of the Commonwealth's Department of Transportation, to John Snow, the Chairman and President of CSX Corporation, the Commonwealth has acknowledged the need for capital improvements to allow the operation of the Railroad's freight service and NRPC's intercity passenger service without interference from the Commissions' commuter service, and the Commonwealth's willingness to provide financial assistance to the Commissions to enable them to fund such improvements as well as a portion of the fees payable to the Railroad under this Agreement. While the Railroad understands that such acknowledgment does not constitute a legally binding commitment,

7

CSXT (continued)

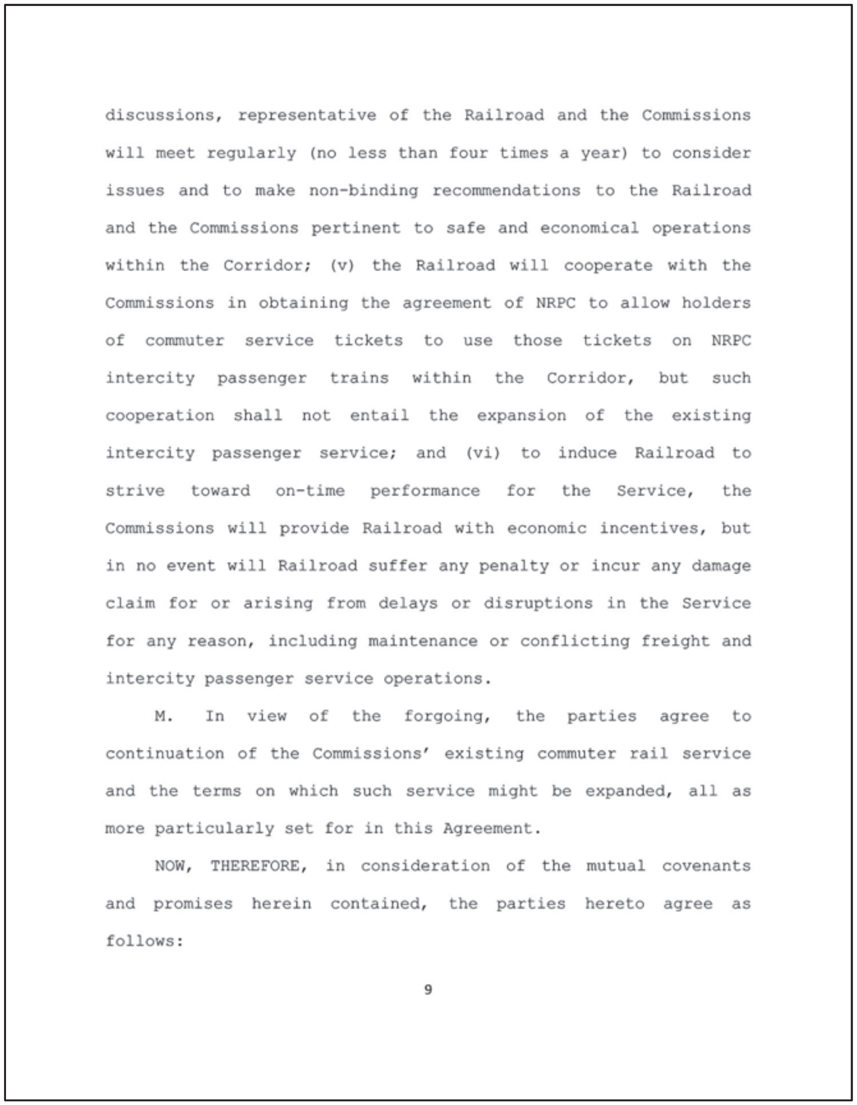


the Railroad has relied upon such acknowledgment in the formulation and its acceptance of the terms and conditions of this Agreement.

L. In view of the foregoing, the Commissions acknowledge and agree that: (i) the Commissions' service may be modified as identified on the annexed Exhibit A-1, subject to the construction of certain capital improvements, pursuant to Section 2.9(b) of this Agreement, at the Commissions' sole cost and expense; (ii) the Commissions have expressed their desire to expand commuter services even further, but acknowledge that no further expansions be allowed within the Corridor, unless and until the Commissions have committed to undertake, with the financial assistance of the Commonwealth and at no expense to the Railroad, pursuant to Section 2.9(c) of the Agreement, the construction of a third parallel mainline to be operated in coordination with the Railroad's existing double-track mainline system and such other improvements and conditions as the Railroad may require, to ensure that commuter operations will not interfere with the operations of the Railroad or NRPC; (iii) the Commissions will undertake in good faith to obtain the public funding necessary, with the financial assistance of the Commonwealth, to so construct such aforesaid improvements which the Railroad requires; (iv) for the purpose of facilitating

8

CSXT (continued)

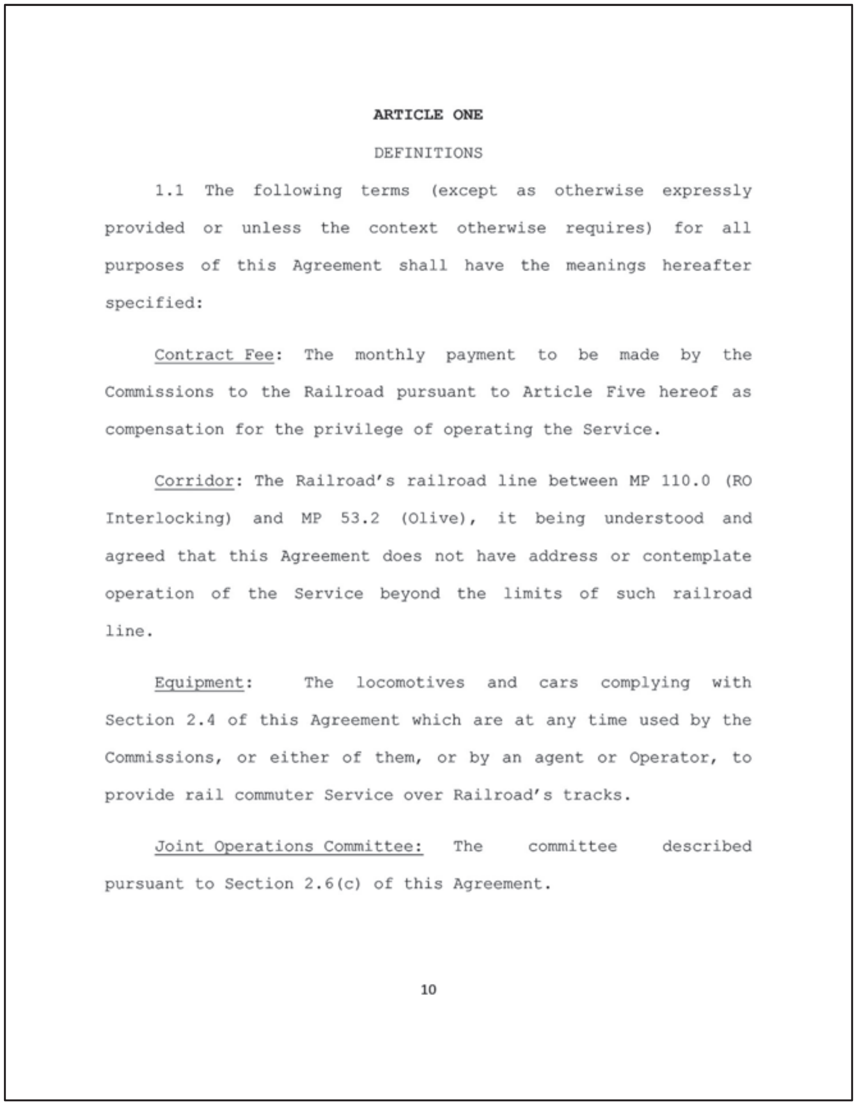


discussions, representative of the Railroad and the Commissions will meet regularly (no less than four times a year) to consider issues and to make non-binding recommendations to the Railroad and the Commissions pertinent to safe and economical operations within the Corridor; (v) the Railroad will cooperate with the Commissions in obtaining the agreement of NRPC to allow holders of commuter service tickets to use those tickets on NRPC intercity passenger trains within the Corridor, but such cooperation shall not entail the expansion of the existing intercity passenger service; and (vi) to induce Railroad to strive toward on-time performance for the Service, the Commissions will provide Railroad with economic incentives, but in no event will Railroad suffer any penalty or incur any damage claim for or arising from delays or disruptions in the Service for any reason, including maintenance or conflicting freight and intercity passenger service operations.

M. In view of the forgoing, the parties agree to continuation of the Commissions' existing commuter rail service and the terms on which such service might be expanded, all as more particularly set for in this Agreement.

NOW, THEREFORE, in consideration of the mutual covenants and promises herein contained, the parties hereto agree as follows:

CSXT (continued)



ARTICLE ONE

DEFINITIONS

1.1 The following terms (except as otherwise expressly provided or unless the context otherwise requires) for all purposes of this Agreement shall have the meanings hereafter specified:

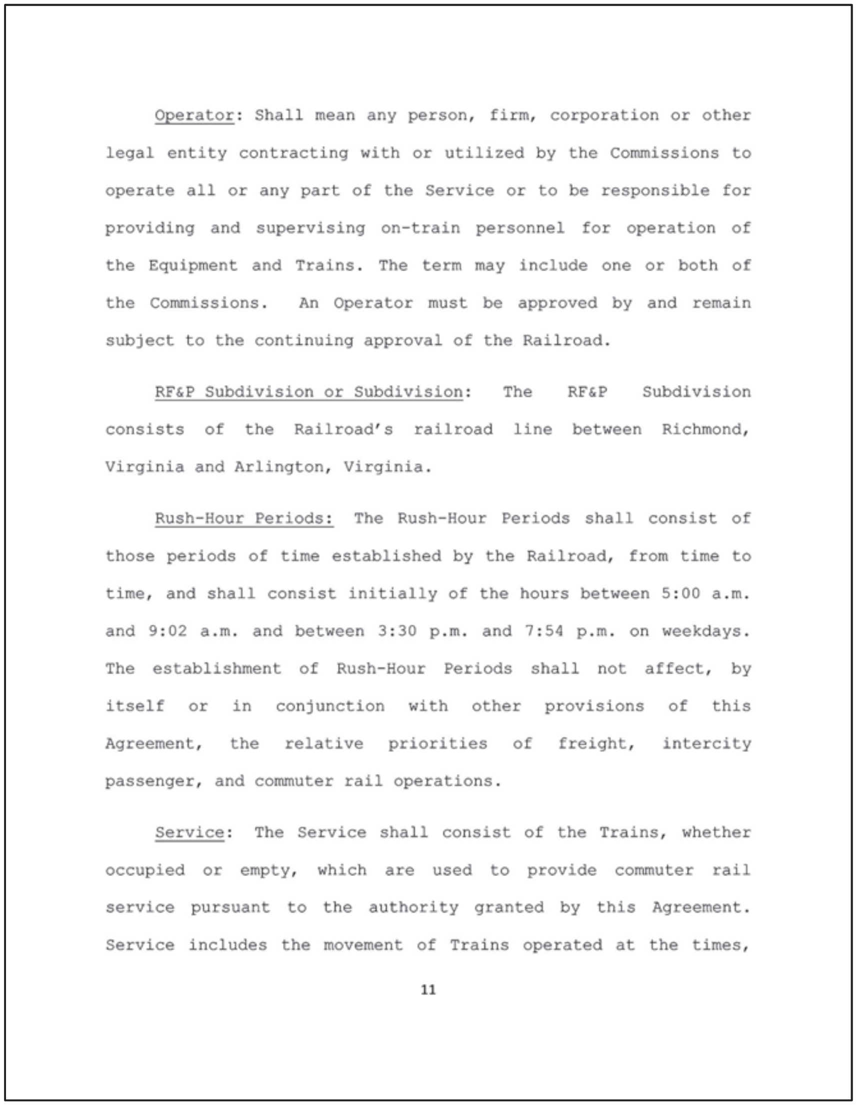
Contract Fee: The monthly payment to be made by the Commissions to the Railroad pursuant to Article Five hereof as compensation for the privilege of operating the Service.

Corridor: The Railroad's railroad line between MP 110.0 (RO Interlocking) and MP 53.2 (Olive), it being understood and agreed that this Agreement does not have address or contemplate operation of the Service beyond the limits of such railroad line.

Equipment: The locomotives and cars complying with Section 2.4 of this Agreement which are at any time used by the Commissions, or either of them, or by an agent or Operator, to provide rail commuter Service over Railroad's tracks.

Joint Operations Committee: The committee described pursuant to Section 2.6(c) of this Agreement.

CSXT (continued)



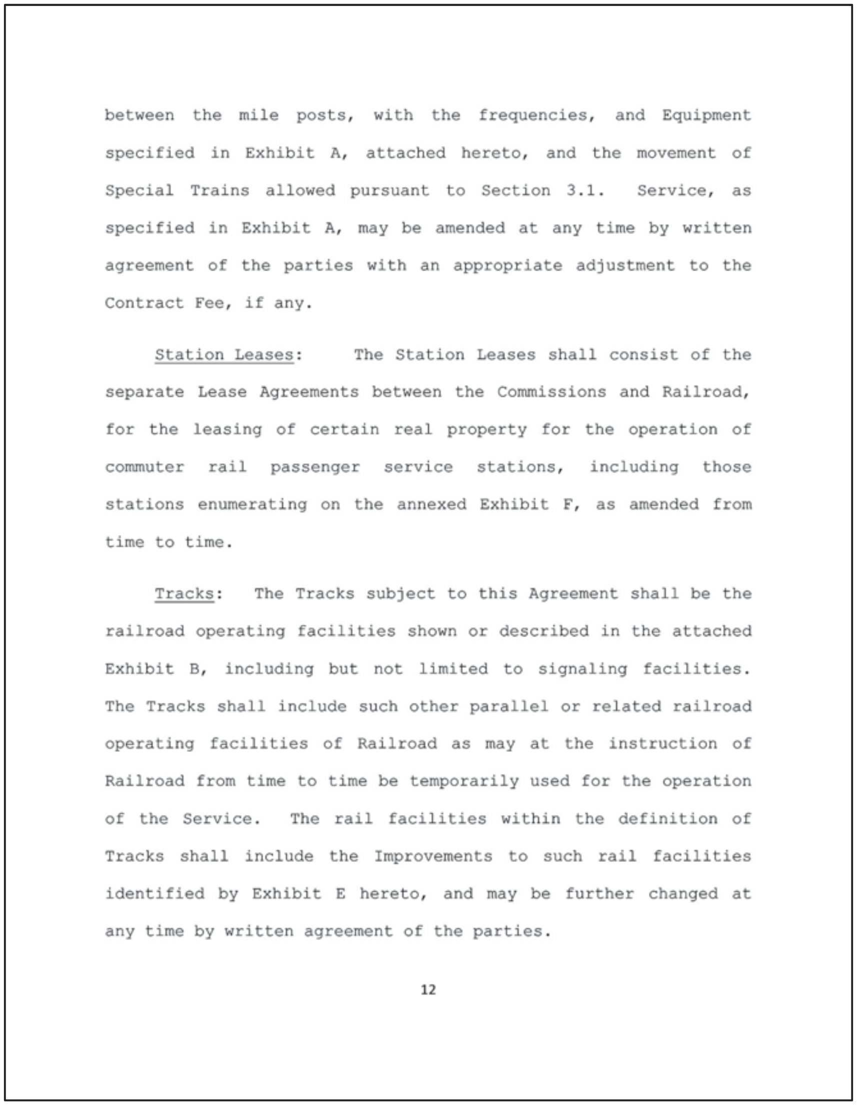
Operator: Shall mean any person, firm, corporation or other legal entity contracting with or utilized by the Commissions to operate all or any part of the Service or to be responsible for providing and supervising on-train personnel for operation of the Equipment and Trains. The term may include one or both of the Commissions. An Operator must be approved by and remain subject to the continuing approval of the Railroad.

RF&P Subdivision or Subdivision: The RF&P Subdivision consists of the Railroad's railroad line between Richmond, Virginia and Arlington, Virginia.

Rush-Hour Periods: The Rush-Hour Periods shall consist of those periods of time established by the Railroad, from time to time, and shall consist initially of the hours between 5:00 a.m. and 9:02 a.m. and between 3:30 p.m. and 7:54 p.m. on weekdays. The establishment of Rush-Hour Periods shall not affect, by itself or in conjunction with other provisions of this Agreement, the relative priorities of freight, intercity passenger, and commuter rail operations.

Service: The Service shall consist of the Trains, whether occupied or empty, which are used to provide commuter rail service pursuant to the authority granted by this Agreement. Service includes the movement of Trains operated at the times,

CSXT (continued)

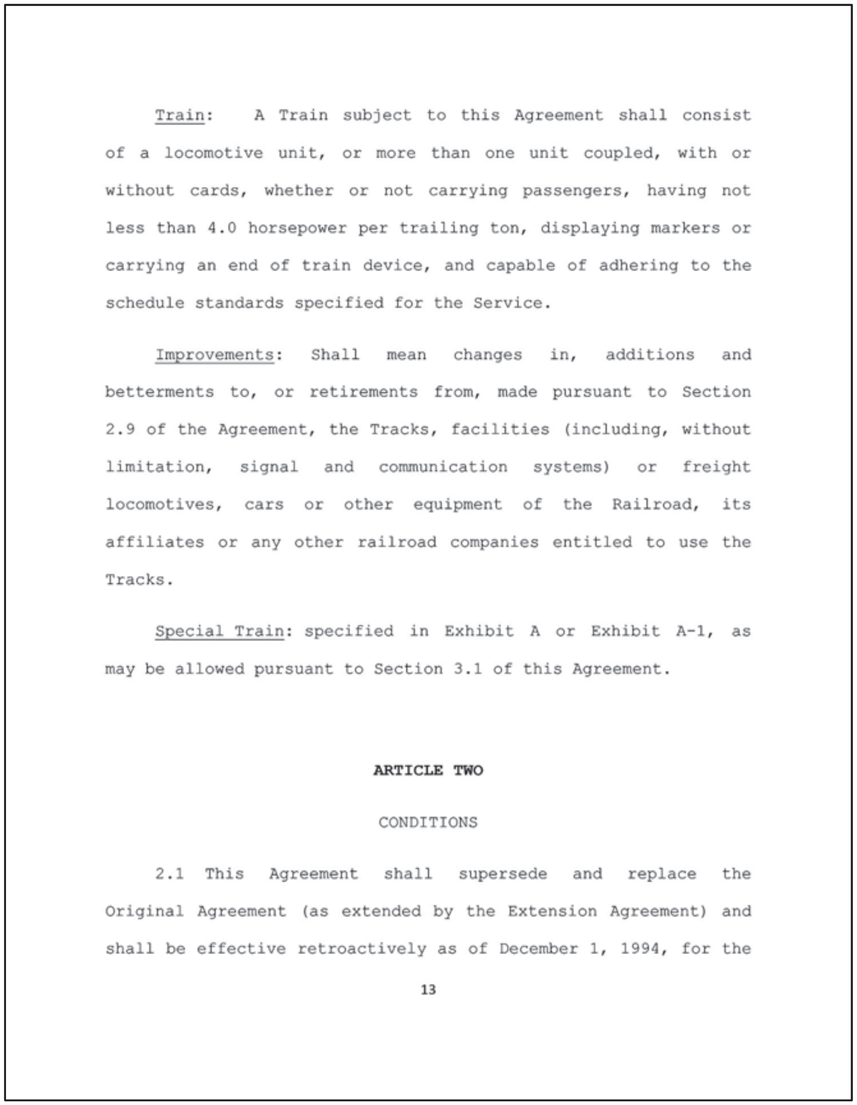


between the mile posts, with the frequencies, and Equipment specified in Exhibit A, attached hereto, and the movement of Special Trains allowed pursuant to Section 3.1. Service, as specified in Exhibit A, may be amended at any time by written agreement of the parties with an appropriate adjustment to the Contract Fee, if any.

Station Leases: The Station Leases shall consist of the separate Lease Agreements between the Commissions and Railroad, for the leasing of certain real property for the operation of commuter rail passenger service stations, including those stations enumerating on the annexed Exhibit F, as amended from time to time.

Tracks: The Tracks subject to this Agreement shall be the railroad operating facilities shown or described in the attached Exhibit B, including but not limited to signaling facilities. The Tracks shall include such other parallel or related railroad operating facilities of Railroad as may at the instruction of Railroad from time to time be temporarily used for the operation of the Service. The rail facilities within the definition of Tracks shall include the Improvements to such rail facilities identified by Exhibit E hereto, and may be further changed at any time by written agreement of the parties.

CSXT (continued)



Train: A Train subject to this Agreement shall consist of a locomotive unit, or more than one unit coupled, with or without cards, whether or not carrying passengers, having not less than 4.0 horsepower per trailing ton, displaying markers or carrying an end of train device, and capable of adhering to the schedule standards specified for the Service.

Improvements: Shall mean changes in, additions and betterments to, or retirements from, made pursuant to Section 2.9 of the Agreement, the Tracks, facilities (including, without limitation, signal and communication systems) or freight locomotives, cars or other equipment of the Railroad, its affiliates or any other railroad companies entitled to use the Tracks.

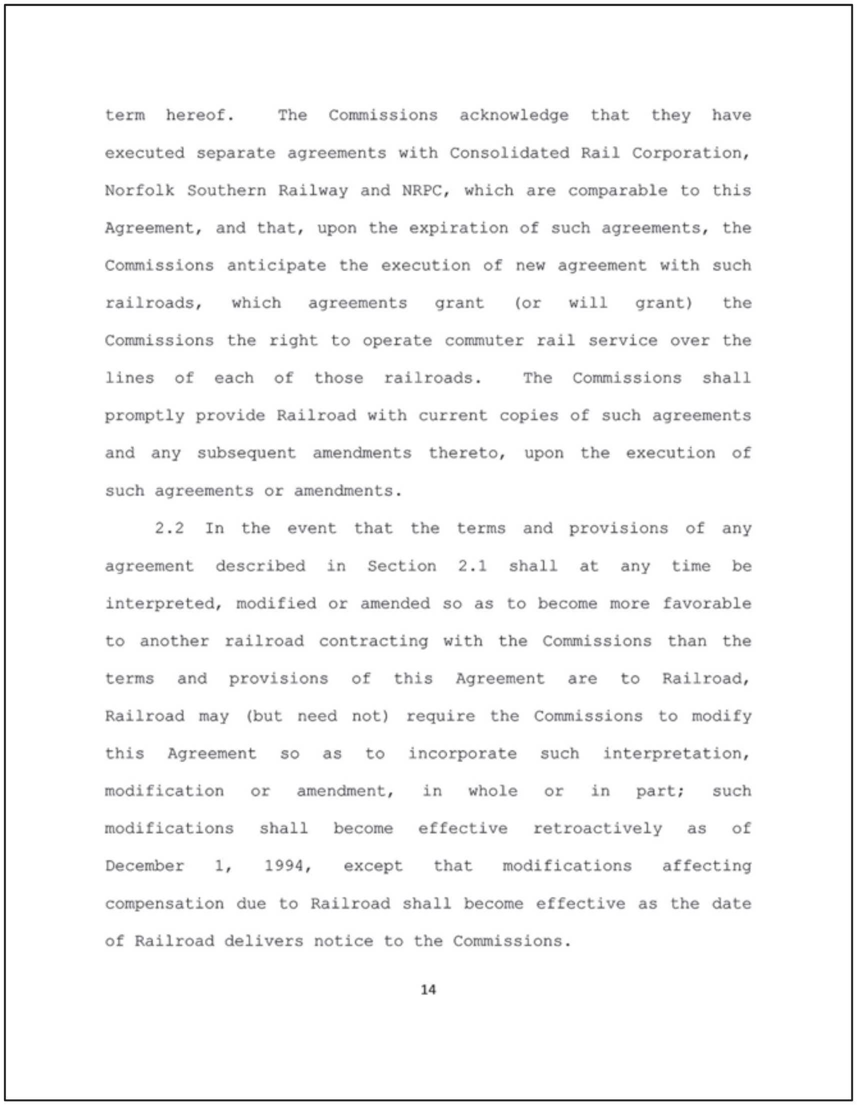
Special Train: specified in Exhibit A or Exhibit A-1, as may be allowed pursuant to Section 3.1 of this Agreement.

ARTICLE TWO

CONDITIONS

2.1 This Agreement shall supersede and replace the Original Agreement (as extended by the Extension Agreement) and shall be effective retroactively as of December 1, 1994, for the

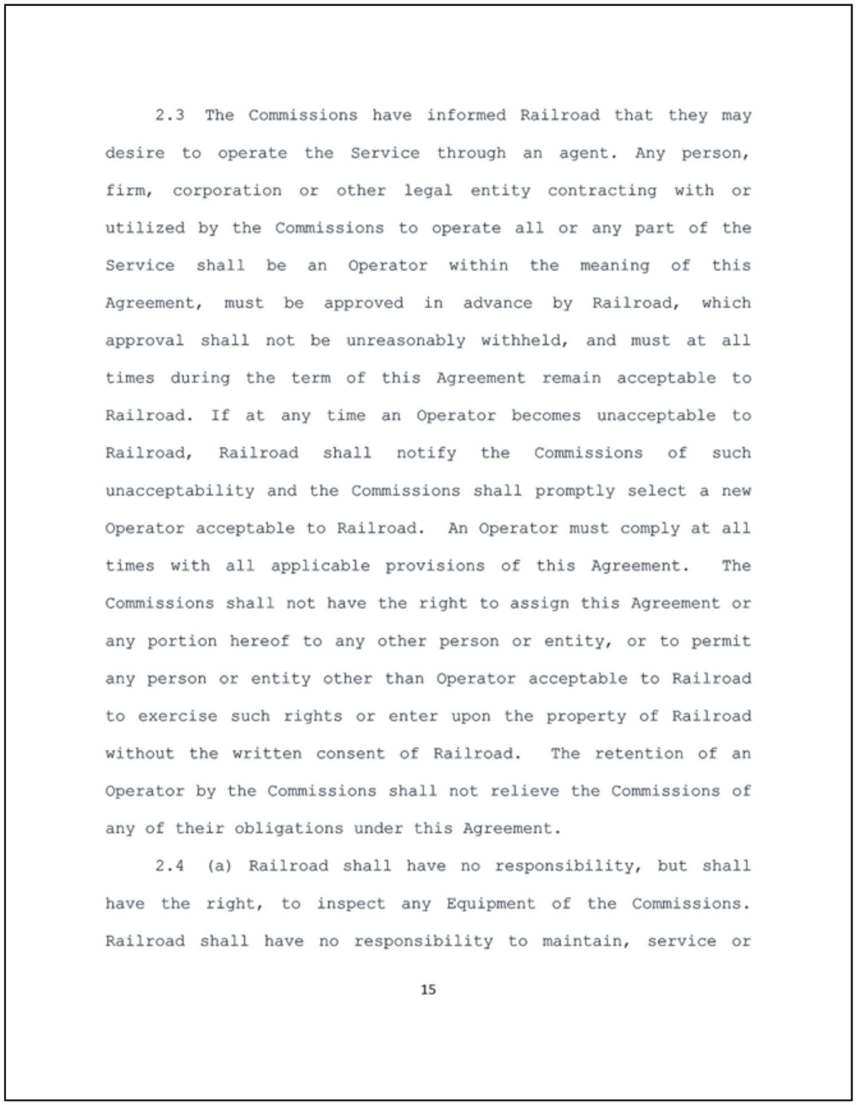
CSXT (continued)



term hereof. The Commissions acknowledge that they have executed separate agreements with Consolidated Rail Corporation, Norfolk Southern Railway and NRPC, which are comparable to this Agreement, and that, upon the expiration of such agreements, the Commissions anticipate the execution of new agreement with such railroads, which agreements grant (or will grant) the Commissions the right to operate commuter rail service over the lines of each of those railroads. The Commissions shall promptly provide Railroad with current copies of such agreements and any subsequent amendments thereto, upon the execution of such agreements or amendments.

2.2 In the event that the terms and provisions of any agreement described in Section 2.1 shall at any time be interpreted, modified or amended so as to become more favorable to another railroad contracting with the Commissions than the terms and provisions of this Agreement are to Railroad, Railroad may (but need not) require the Commissions to modify this Agreement so as to incorporate such interpretation, modification or amendment, in whole or in part; such modifications shall become effective retroactively as of December 1, 1994, except that modifications affecting compensation due to Railroad shall become effective as the date of Railroad delivers notice to the Commissions.

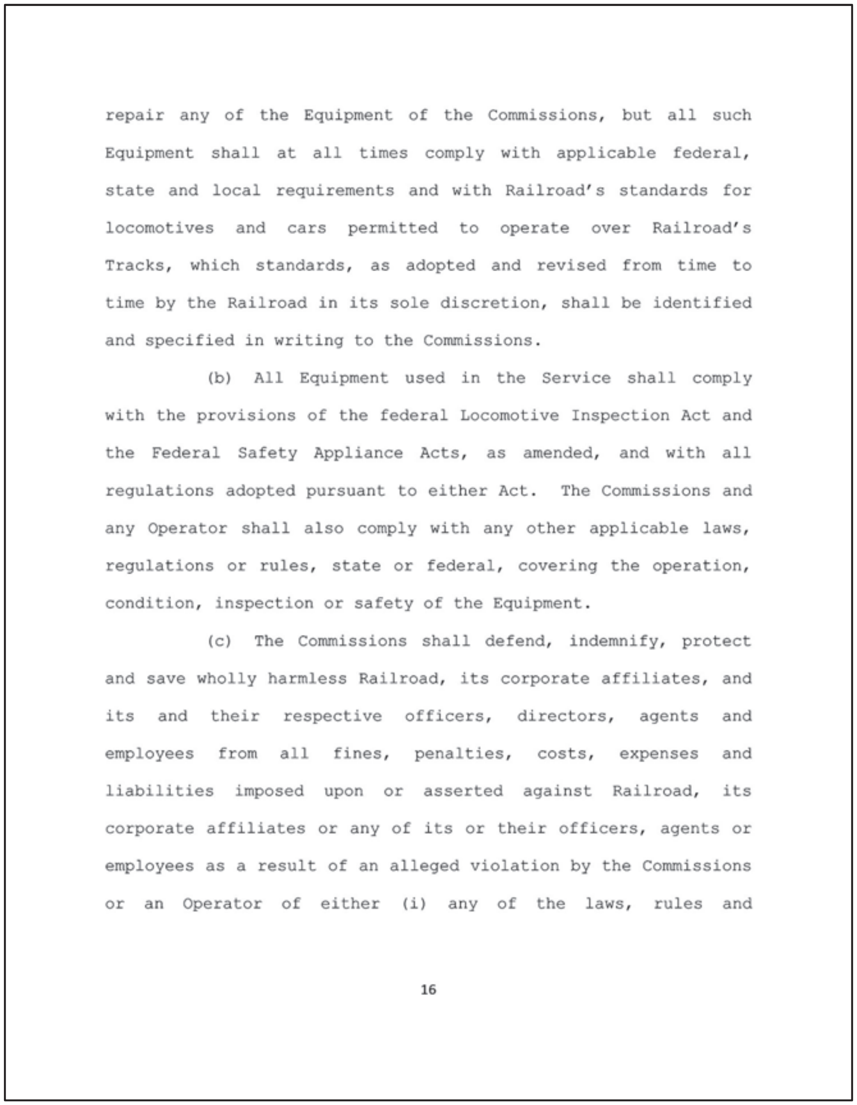
CSXT (continued)



2.3 The Commissions have informed Railroad that they may desire to operate the Service through an agent. Any person, firm, corporation or other legal entity contracting with or utilized by the Commissions to operate all or any part of the Service shall be an Operator within the meaning of this Agreement, must be approved in advance by Railroad, which approval shall not be unreasonably withheld, and must at all times during the term of this Agreement remain acceptable to Railroad. If at any time an Operator becomes unacceptable to Railroad, Railroad shall notify the Commissions of such unacceptability and the Commissions shall promptly select a new Operator acceptable to Railroad. An Operator must comply at all times with all applicable provisions of this Agreement. The Commissions shall not have the right to assign this Agreement or any portion hereof to any other person or entity, or to permit any person or entity other than Operator acceptable to Railroad to exercise such rights or enter upon the property of Railroad without the written consent of Railroad. The retention of an Operator by the Commissions shall not relieve the Commissions of any of their obligations under this Agreement.

2.4 (a) Railroad shall have no responsibility, but shall have the right, to inspect any Equipment of the Commissions. Railroad shall have no responsibility to maintain, service or

CSXT (continued)

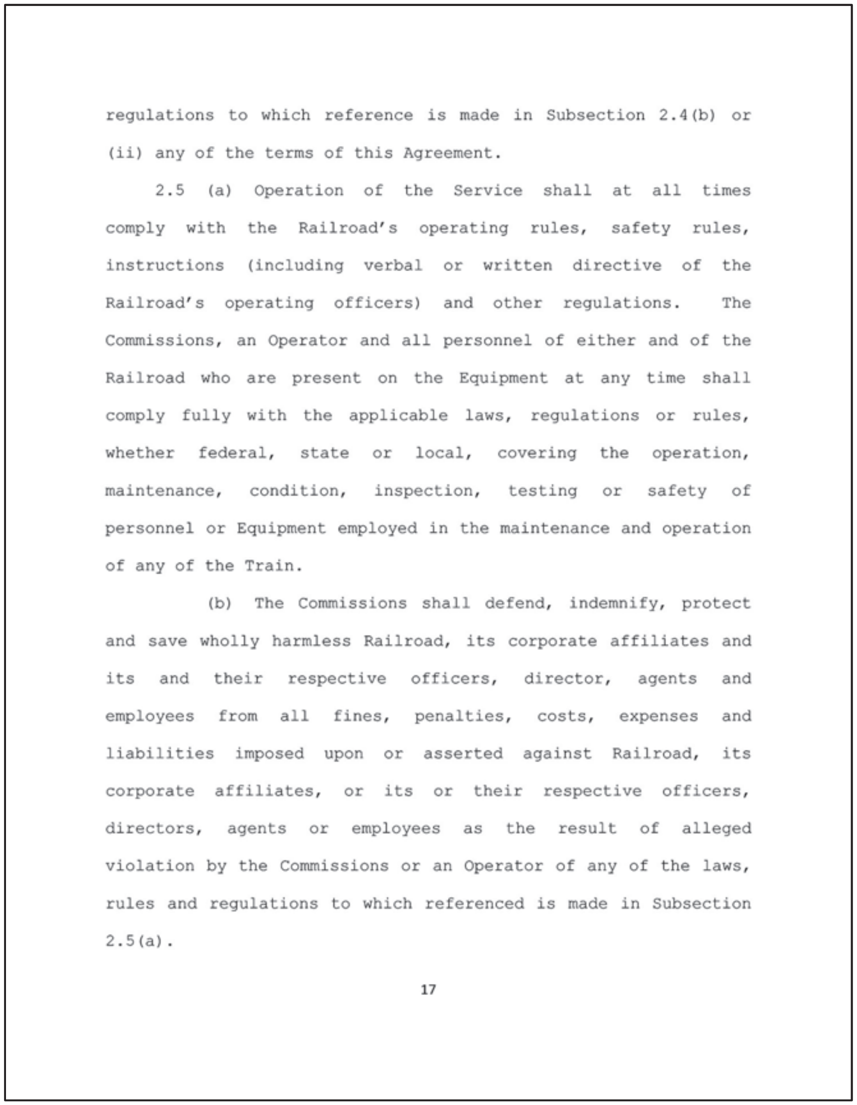


repair any of the Equipment of the Commissions, but all such Equipment shall at all times comply with applicable federal, state and local requirements and with Railroad’s standards for locomotives and cars permitted to operate over Railroad’s Tracks, which standards, as adopted and revised from time to time by the Railroad in its sole discretion, shall be identified and specified in writing to the Commissions.

(b) All Equipment used in the Service shall comply with the provisions of the federal Locomotive Inspection Act and the Federal Safety Appliance Acts, as amended, and with all regulations adopted pursuant to either Act. The Commissions and any Operator shall also comply with any other applicable laws, regulations or rules, state or federal, covering the operation, condition, inspection or safety of the Equipment.

(c) The Commissions shall defend, indemnify, protect and save wholly harmless Railroad, its corporate affiliates, and its and their respective officers, directors, agents and employees from all fines, penalties, costs, expenses and liabilities imposed upon or asserted against Railroad, its corporate affiliates or any of its or their officers, agents or employees as a result of an alleged violation by the Commissions or an Operator of either (i) any of the laws, rules and

CSXT (continued)

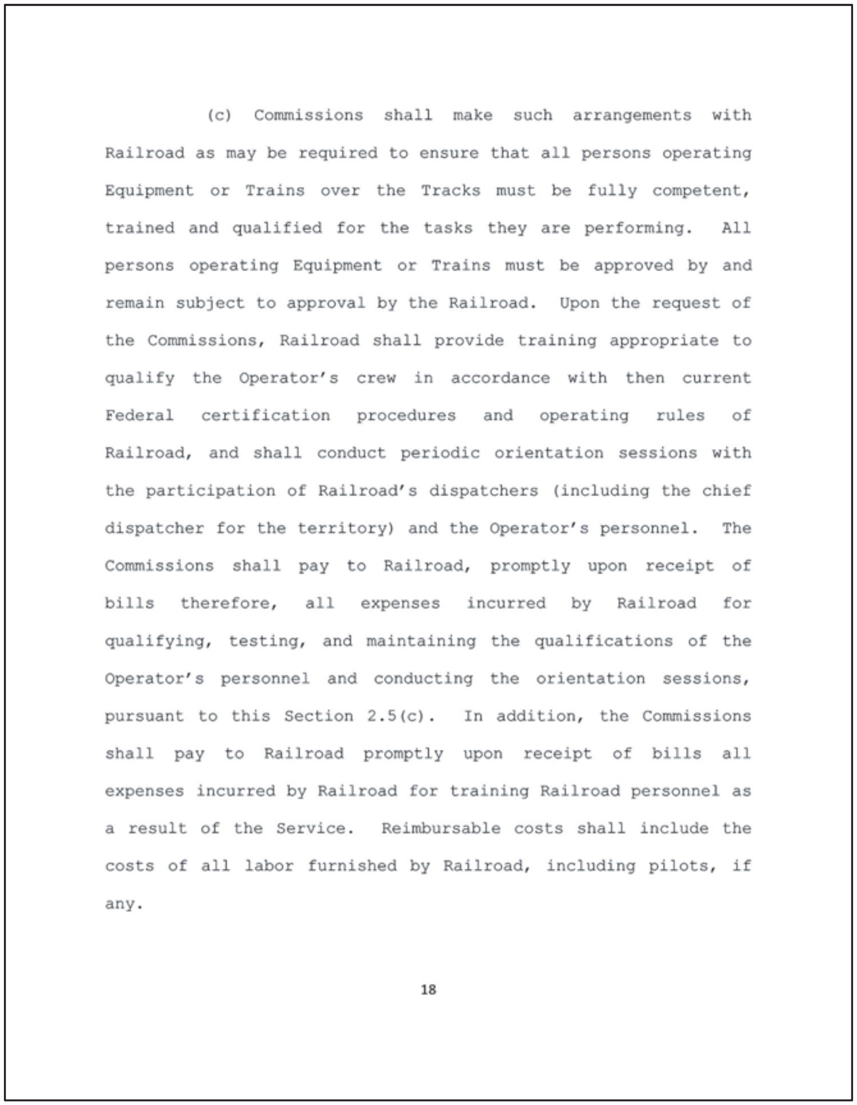


regulations to which reference is made in Subsection 2.4(b) or (ii) any of the terms of this Agreement.

2.5 (a) Operation of the Service shall at all times comply with the Railroad's operating rules, safety rules, instructions (including verbal or written directive of the Railroad's operating officers) and other regulations. The Commissions, an Operator and all personnel of either and of the Railroad who are present on the Equipment at any time shall comply fully with the applicable laws, regulations or rules, whether federal, state or local, covering the operation, maintenance, condition, inspection, testing or safety of personnel or Equipment employed in the maintenance and operation of any of the Train.

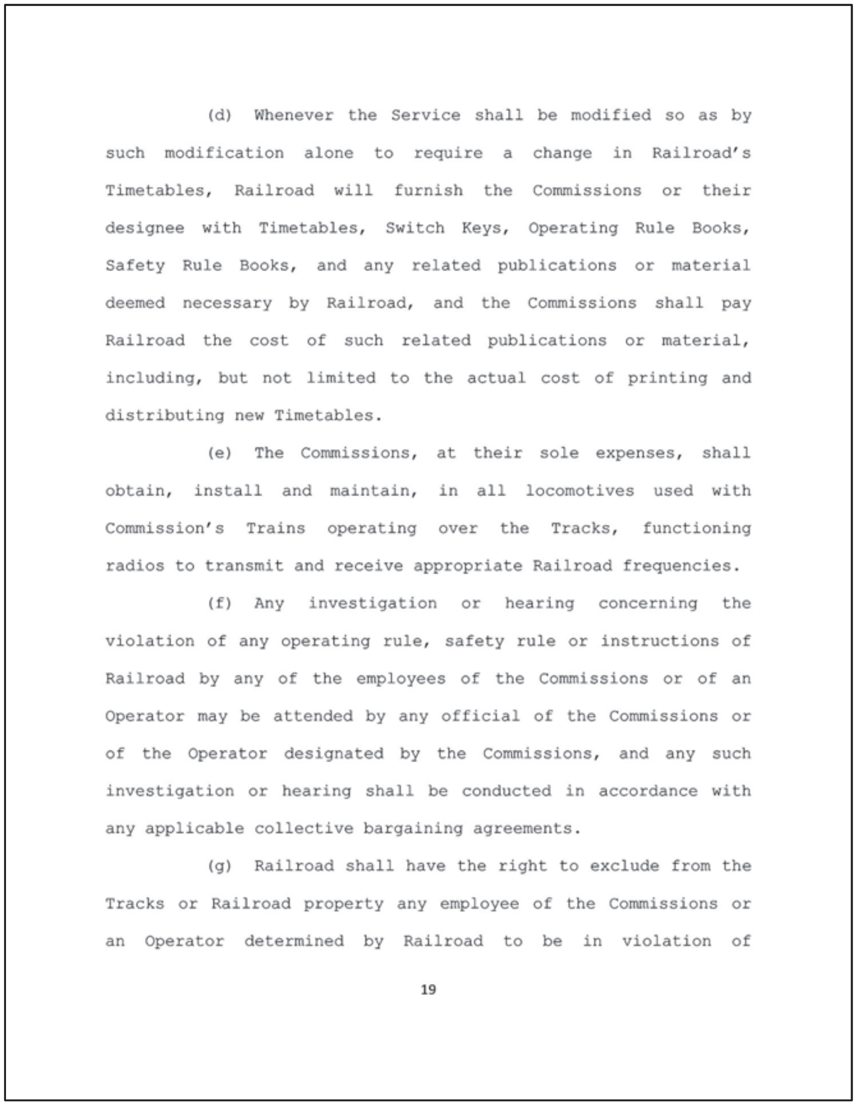
(b) The Commissions shall defend, indemnify, protect and save wholly harmless Railroad, its corporate affiliates and its and their respective officers, director, agents and employees from all fines, penalties, costs, expenses and liabilities imposed upon or asserted against Railroad, its corporate affiliates, or its or their respective officers, directors, agents or employees as the result of alleged violation by the Commissions or an Operator of any of the laws, rules and regulations to which referenced is made in Subsection 2.5(a).

CSXT (continued)



(c) Commissions shall make such arrangements with Railroad as may be required to ensure that all persons operating Equipment or Trains over the Tracks must be fully competent, trained and qualified for the tasks they are performing. All persons operating Equipment or Trains must be approved by and remain subject to approval by the Railroad. Upon the request of the Commissions, Railroad shall provide training appropriate to qualify the Operator's crew in accordance with then current Federal certification procedures and operating rules of Railroad, and shall conduct periodic orientation sessions with the participation of Railroad's dispatchers (including the chief dispatcher for the territory) and the Operator's personnel. The Commissions shall pay to Railroad, promptly upon receipt of bills therefore, all expenses incurred by Railroad for qualifying, testing, and maintaining the qualifications of the Operator's personnel and conducting the orientation sessions, pursuant to this Section 2.5(c). In addition, the Commissions shall pay to Railroad promptly upon receipt of bills all expenses incurred by Railroad for training Railroad personnel as a result of the Service. Reimbursable costs shall include the costs of all labor furnished by Railroad, including pilots, if any.

CSXT (continued)



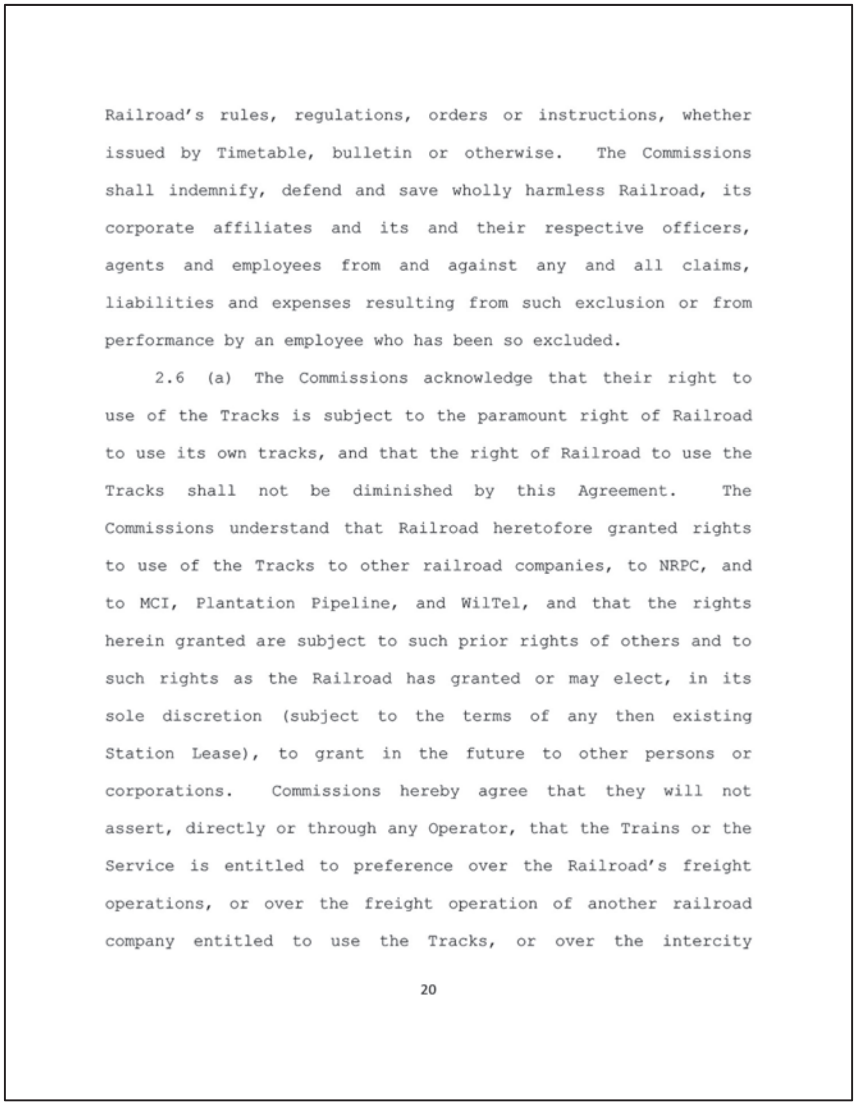
(d) Whenever the Service shall be modified so as by such modification alone to require a change in Railroad's Timetables, Railroad will furnish the Commissions or their designee with Timetables, Switch Keys, Operating Rule Books, Safety Rule Books, and any related publications or material deemed necessary by Railroad, and the Commissions shall pay Railroad the cost of such related publications or material, including, but not limited to the actual cost of printing and distributing new Timetables.

(e) The Commissions, at their sole expenses, shall obtain, install and maintain, in all locomotives used with Commission's Trains operating over the Tracks, functioning radios to transmit and receive appropriate Railroad frequencies.

(f) Any investigation or hearing concerning the violation of any operating rule, safety rule or instructions of Railroad by any of the employees of the Commissions or of an Operator may be attended by any official of the Commissions or of the Operator designated by the Commissions, and any such investigation or hearing shall be conducted in accordance with any applicable collective bargaining agreements.

(g) Railroad shall have the right to exclude from the Tracks or Railroad property any employee of the Commissions or an Operator determined by Railroad to be in violation of

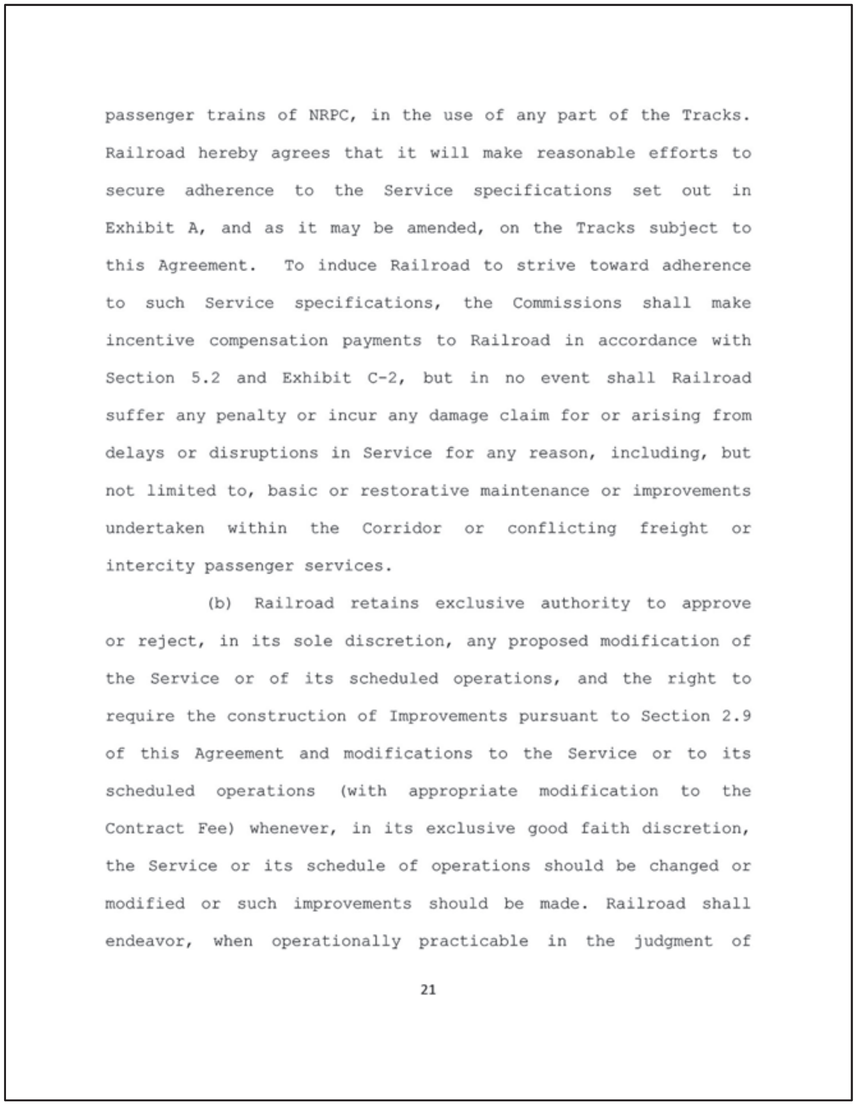
CSXT (continued)



Railroad's rules, regulations, orders or instructions, whether issued by Timetable, bulletin or otherwise. The Commissions shall indemnify, defend and save wholly harmless Railroad, its corporate affiliates and its and their respective officers, agents and employees from and against any and all claims, liabilities and expenses resulting from such exclusion or from performance by an employee who has been so excluded.

2.6 (a) The Commissions acknowledge that their right to use of the Tracks is subject to the paramount right of Railroad to use its own tracks, and that the right of Railroad to use the Tracks shall not be diminished by this Agreement. The Commissions understand that Railroad heretofore granted rights to use of the Tracks to other railroad companies, to NRPC, and to MCI, Plantation Pipeline, and WilTel, and that the rights herein granted are subject to such prior rights of others and to such rights as the Railroad has granted or may elect, in its sole discretion (subject to the terms of any then existing Station Lease), to grant in the future to other persons or corporations. Commissions hereby agree that they will not assert, directly or through any Operator, that the Trains or the Service is entitled to preference over the Railroad's freight operations, or over the freight operation of another railroad company entitled to use the Tracks, or over the intercity

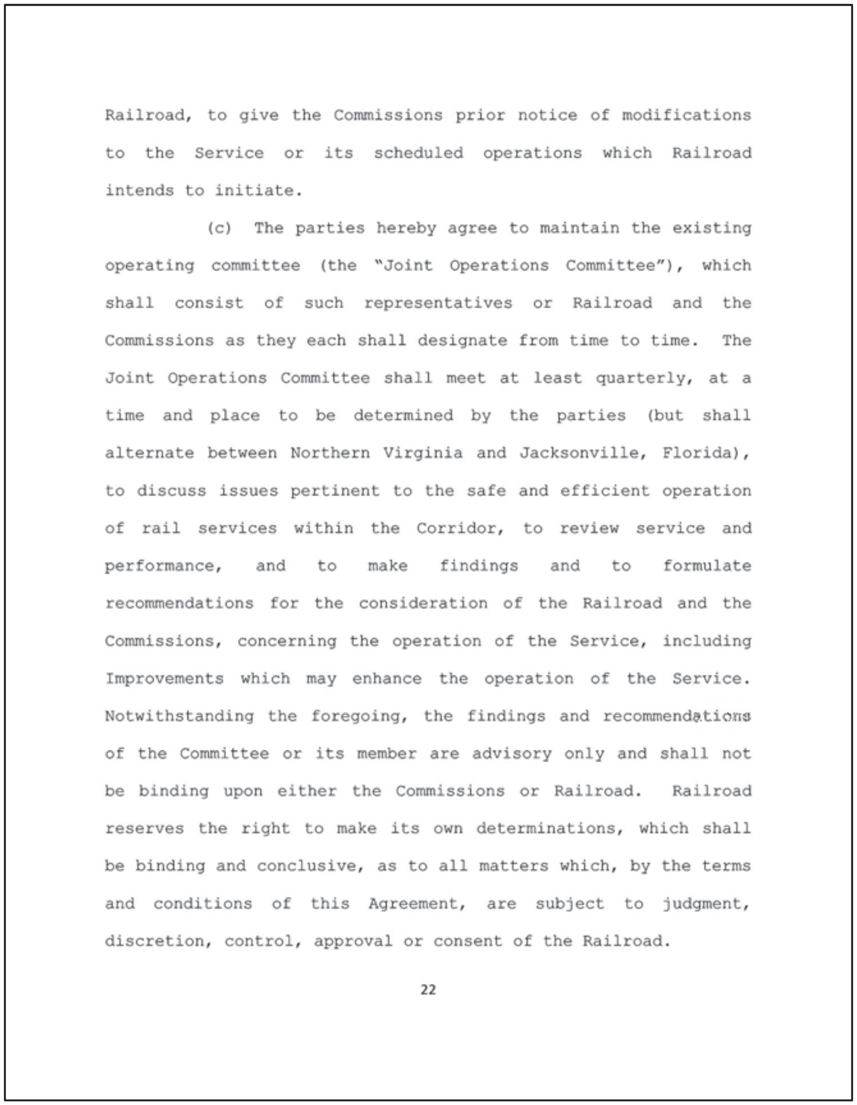
CSXT (continued)



passenger trains of NRPC, in the use of any part of the Tracks. Railroad hereby agrees that it will make reasonable efforts to secure adherence to the Service specifications set out in Exhibit A, and as it may be amended, on the Tracks subject to this Agreement. To induce Railroad to strive toward adherence to such Service specifications, the Commissions shall make incentive compensation payments to Railroad in accordance with Section 5.2 and Exhibit C-2, but in no event shall Railroad suffer any penalty or incur any damage claim for or arising from delays or disruptions in Service for any reason, including, but not limited to, basic or restorative maintenance or improvements undertaken within the Corridor or conflicting freight or intercity passenger services.

(b) Railroad retains exclusive authority to approve or reject, in its sole discretion, any proposed modification of the Service or of its scheduled operations, and the right to require the construction of Improvements pursuant to Section 2.9 of this Agreement and modifications to the Service or to its scheduled operations (with appropriate modification to the Contract Fee) whenever, in its exclusive good faith discretion, the Service or its schedule of operations should be changed or modified or such improvements should be made. Railroad shall endeavor, when operationally practicable in the judgment of

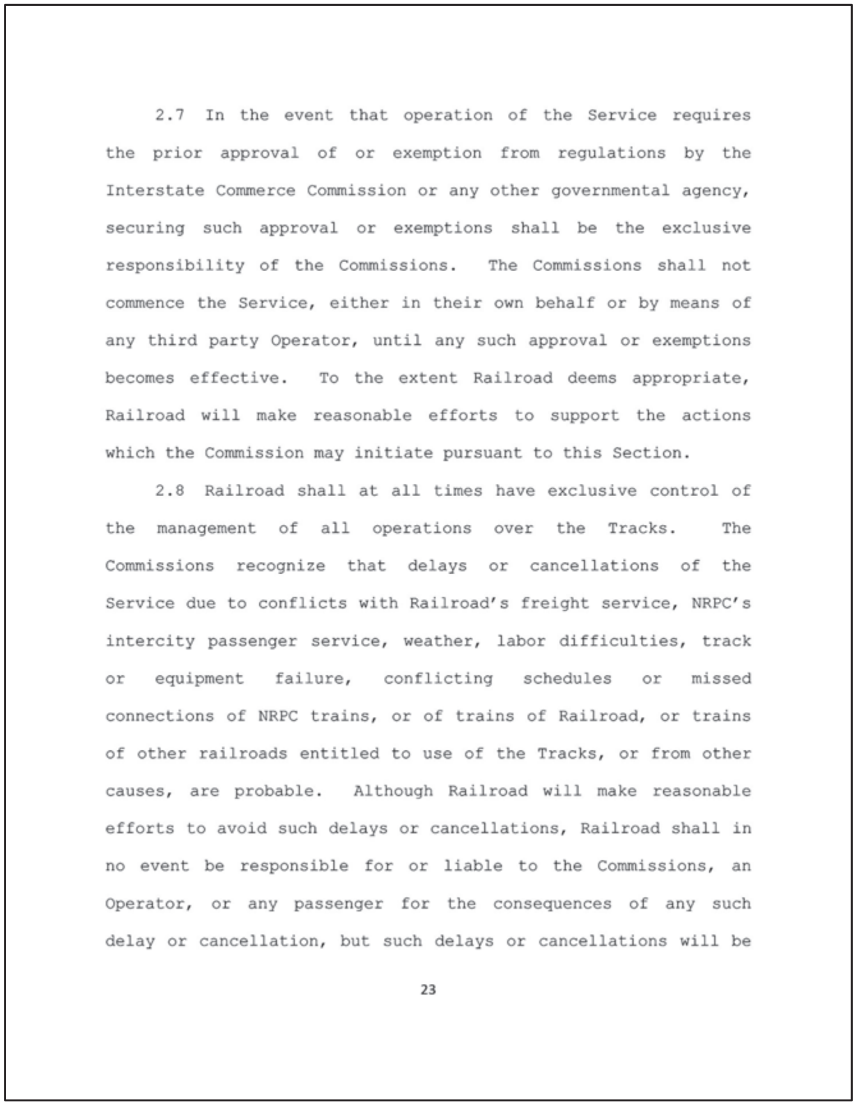
CSXT (continued)



Railroad, to give the Commissions prior notice of modifications to the Service or its scheduled operations which Railroad intends to initiate.

(c) The parties hereby agree to maintain the existing operating committee (the "Joint Operations Committee"), which shall consist of such representatives or Railroad and the Commissions as they each shall designate from time to time. The Joint Operations Committee shall meet at least quarterly, at a time and place to be determined by the parties (but shall alternate between Northern Virginia and Jacksonville, Florida), to discuss issues pertinent to the safe and efficient operation of rail services within the Corridor, to review service and performance, and to make findings and to formulate recommendations for the consideration of the Railroad and the Commissions, concerning the operation of the Service, including Improvements which may enhance the operation of the Service. Notwithstanding the foregoing, the findings and recommendations of the Committee or its member are advisory only and shall not be binding upon either the Commissions or Railroad. Railroad reserves the right to make its own determinations, which shall be binding and conclusive, as to all matters which, by the terms and conditions of this Agreement, are subject to judgment, discretion, control, approval or consent of the Railroad.

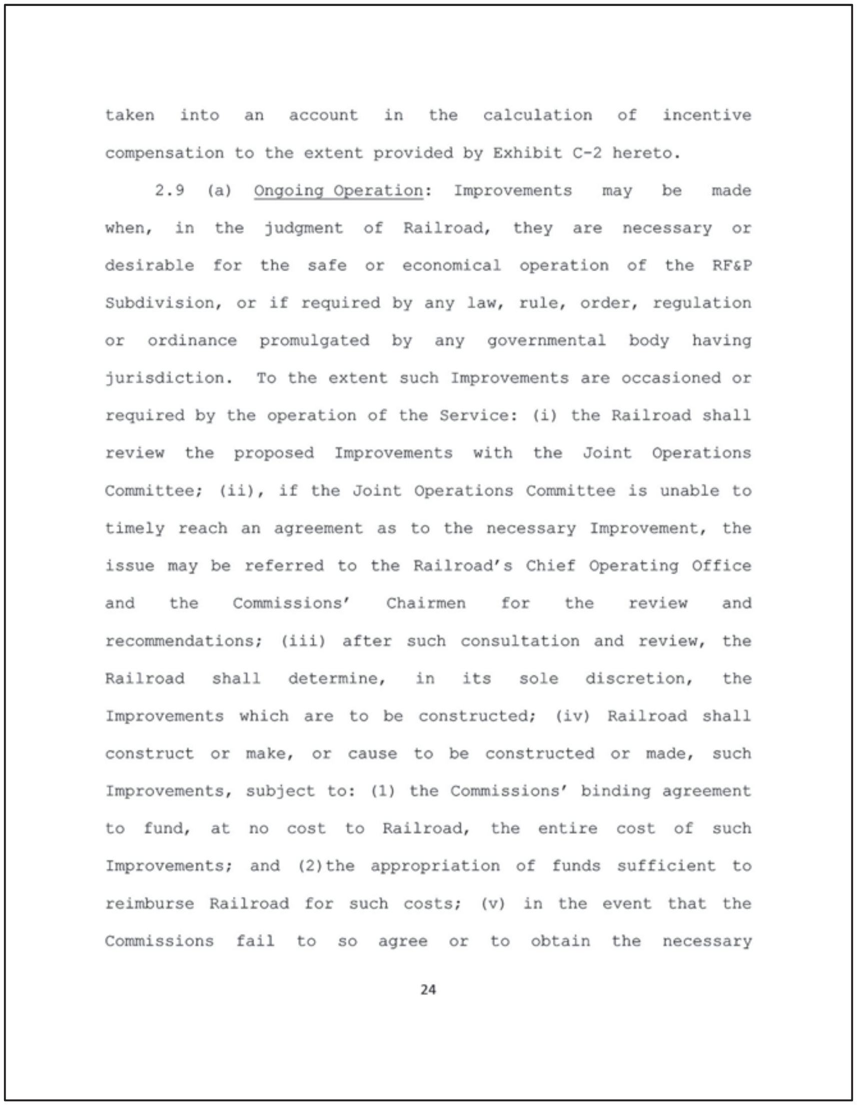
CSXT (continued)



2.7 In the event that operation of the Service requires the prior approval of or exemption from regulations by the Interstate Commerce Commission or any other governmental agency, securing such approval or exemptions shall be the exclusive responsibility of the Commissions. The Commissions shall not commence the Service, either in their own behalf or by means of any third party Operator, until any such approval or exemptions becomes effective. To the extent Railroad deems appropriate, Railroad will make reasonable efforts to support the actions which the Commission may initiate pursuant to this Section.

2.8 Railroad shall at all times have exclusive control of the management of all operations over the Tracks. The Commissions recognize that delays or cancellations of the Service due to conflicts with Railroad's freight service, NRPC's intercity passenger service, weather, labor difficulties, track or equipment failure, conflicting schedules or missed connections of NRPC trains, or of trains of Railroad, or trains of other railroads entitled to use of the Tracks, or from other causes, are probable. Although Railroad will make reasonable efforts to avoid such delays or cancellations, Railroad shall in no event be responsible for or liable to the Commissions, an Operator, or any passenger for the consequences of any such delay or cancellation, but such delays or cancellations will be

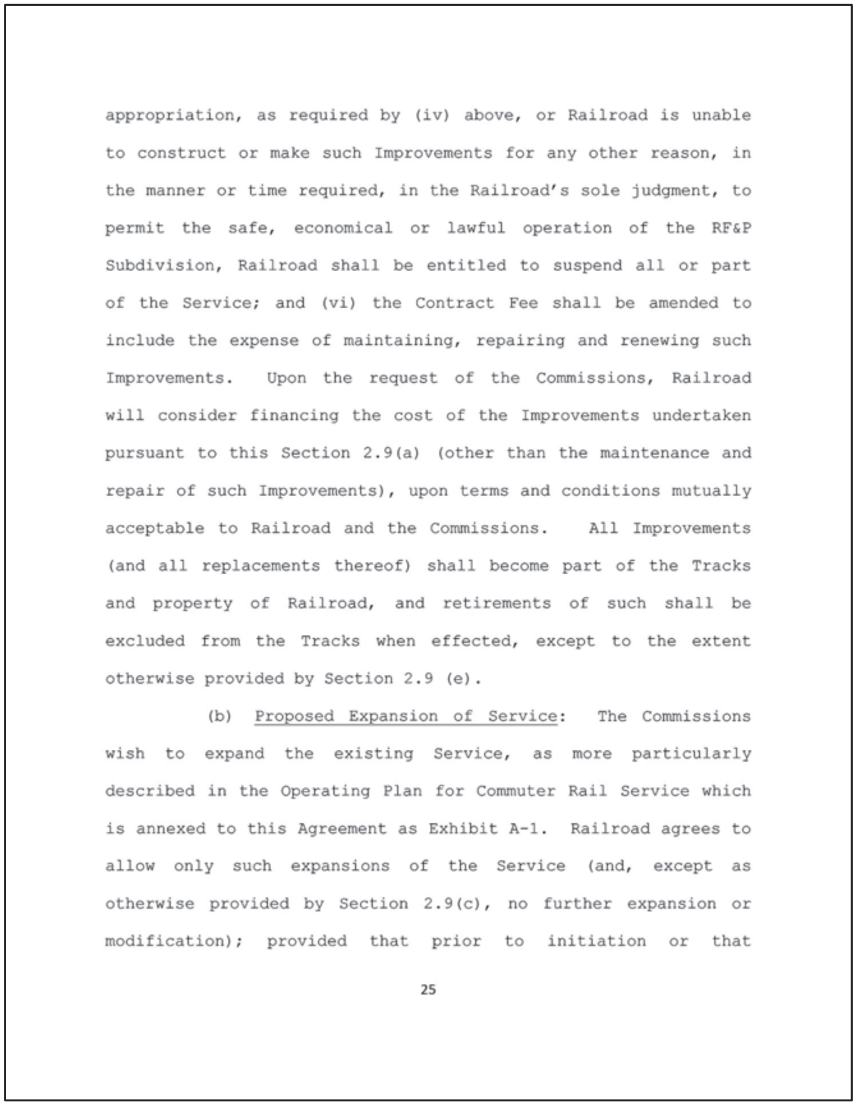
CSXT (continued)



taken into an account in the calculation of incentive compensation to the extent provided by Exhibit C-2 hereto.

2.9 (a) Ongoing Operation: Improvements may be made when, in the judgment of Railroad, they are necessary or desirable for the safe or economical operation of the RF&P Subdivision, or if required by any law, rule, order, regulation or ordinance promulgated by any governmental body having jurisdiction. To the extent such Improvements are occasioned or required by the operation of the Service: (i) the Railroad shall review the proposed Improvements with the Joint Operations Committee; (ii), if the Joint Operations Committee is unable to timely reach an agreement as to the necessary Improvement, the issue may be referred to the Railroad's Chief Operating Office and the Commissions' Chairmen for the review and recommendations; (iii) after such consultation and review, the Railroad shall determine, in its sole discretion, the Improvements which are to be constructed; (iv) Railroad shall construct or make, or cause to be constructed or made, such Improvements, subject to: (1) the Commissions' binding agreement to fund, at no cost to Railroad, the entire cost of such Improvements; and (2)the appropriation of funds sufficient to reimburse Railroad for such costs; (v) in the event that the Commissions fail to so agree or to obtain the necessary

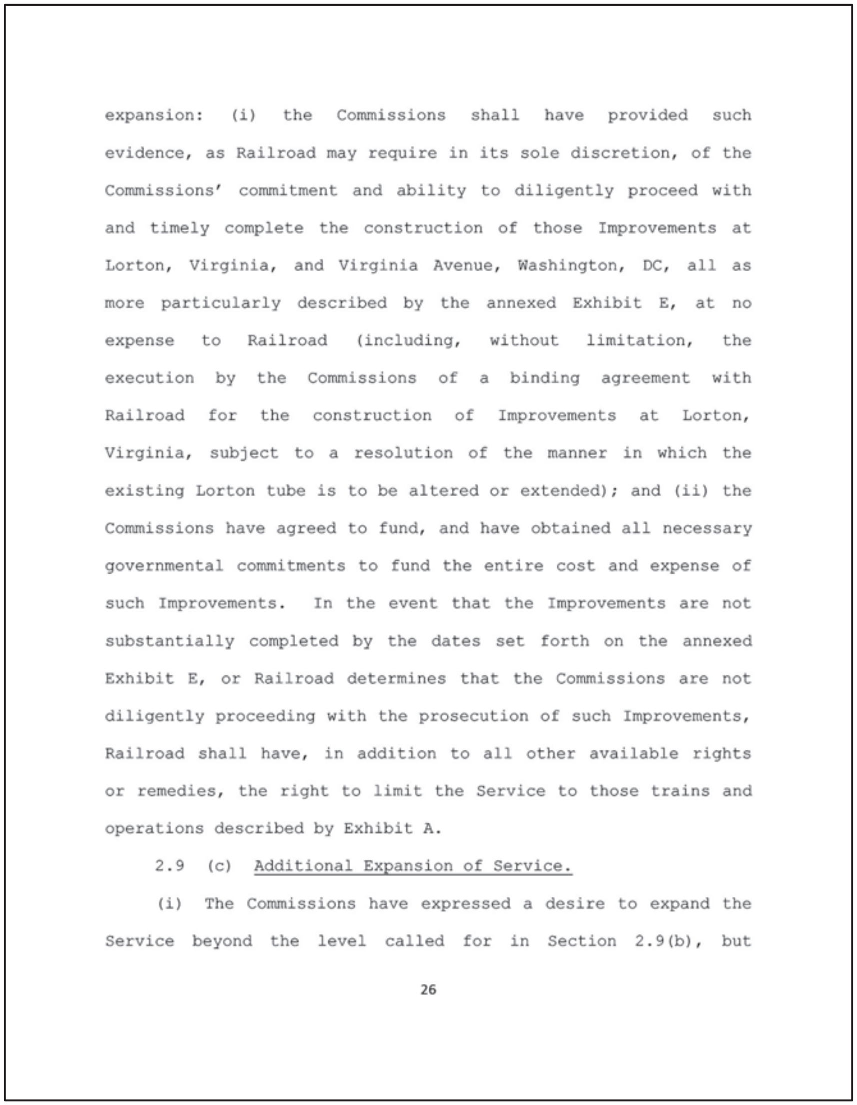
CSXT (continued)



appropriation, as required by (iv) above, or Railroad is unable to construct or make such Improvements for any other reason, in the manner or time required, in the Railroad's sole judgment, to permit the safe, economical or lawful operation of the RF&P Subdivision, Railroad shall be entitled to suspend all or part of the Service; and (vi) the Contract Fee shall be amended to include the expense of maintaining, repairing and renewing such Improvements. Upon the request of the Commissions, Railroad will consider financing the cost of the Improvements undertaken pursuant to this Section 2.9(a) (other than the maintenance and repair of such Improvements), upon terms and conditions mutually acceptable to Railroad and the Commissions. All Improvements (and all replacements thereof) shall become part of the Tracks and property of Railroad, and retirements of such shall be excluded from the Tracks when effected, except to the extent otherwise provided by Section 2.9 (e).

(b) Proposed Expansion of Service: The Commissions wish to expand the existing Service, as more particularly described in the Operating Plan for Commuter Rail Service which is annexed to this Agreement as Exhibit A-1. Railroad agrees to allow only such expansions of the Service (and, except as otherwise provided by Section 2.9(c), no further expansion or modification); provided that prior to initiation or that

CSXT (continued)

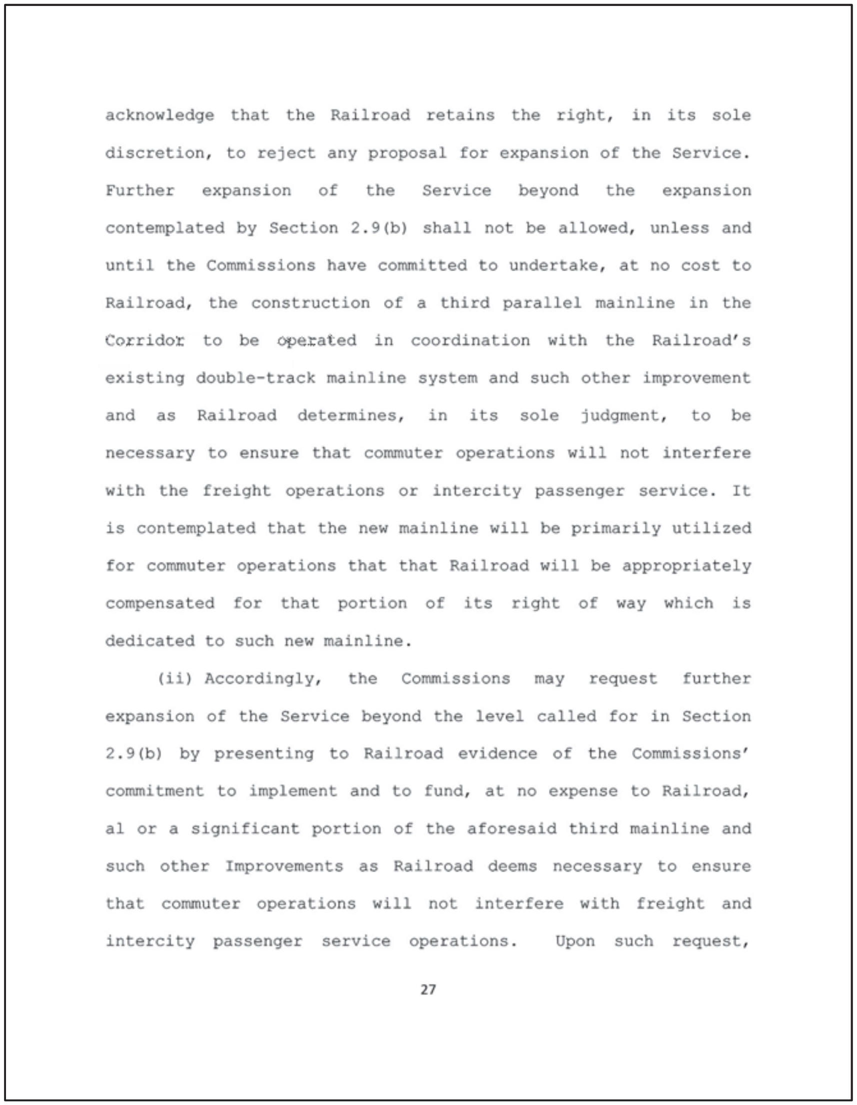


expansion: (i) the Commissions shall have provided such evidence, as Railroad may require in its sole discretion, of the Commissions' commitment and ability to diligently proceed with and timely complete the construction of those Improvements at Lorton, Virginia, and Virginia Avenue, Washington, DC, all as more particularly described by the annexed Exhibit E, at no expense to Railroad (including, without limitation, the execution by the Commissions of a binding agreement with Railroad for the construction of Improvements at Lorton, Virginia, subject to a resolution of the manner in which the existing Lorton tube is to be altered or extended); and (ii) the Commissions have agreed to fund, and have obtained all necessary governmental commitments to fund the entire cost and expense of such Improvements. In the event that the Improvements are not substantially completed by the dates set forth on the annexed Exhibit E, or Railroad determines that the Commissions are not diligently proceeding with the prosecution of such Improvements, Railroad shall have, in addition to all other available rights or remedies, the right to limit the Service to those trains and operations described by Exhibit A.

2.9 (c) Additional Expansion of Service.

(i) The Commissions have expressed a desire to expand the Service beyond the level called for in Section 2.9(b), but

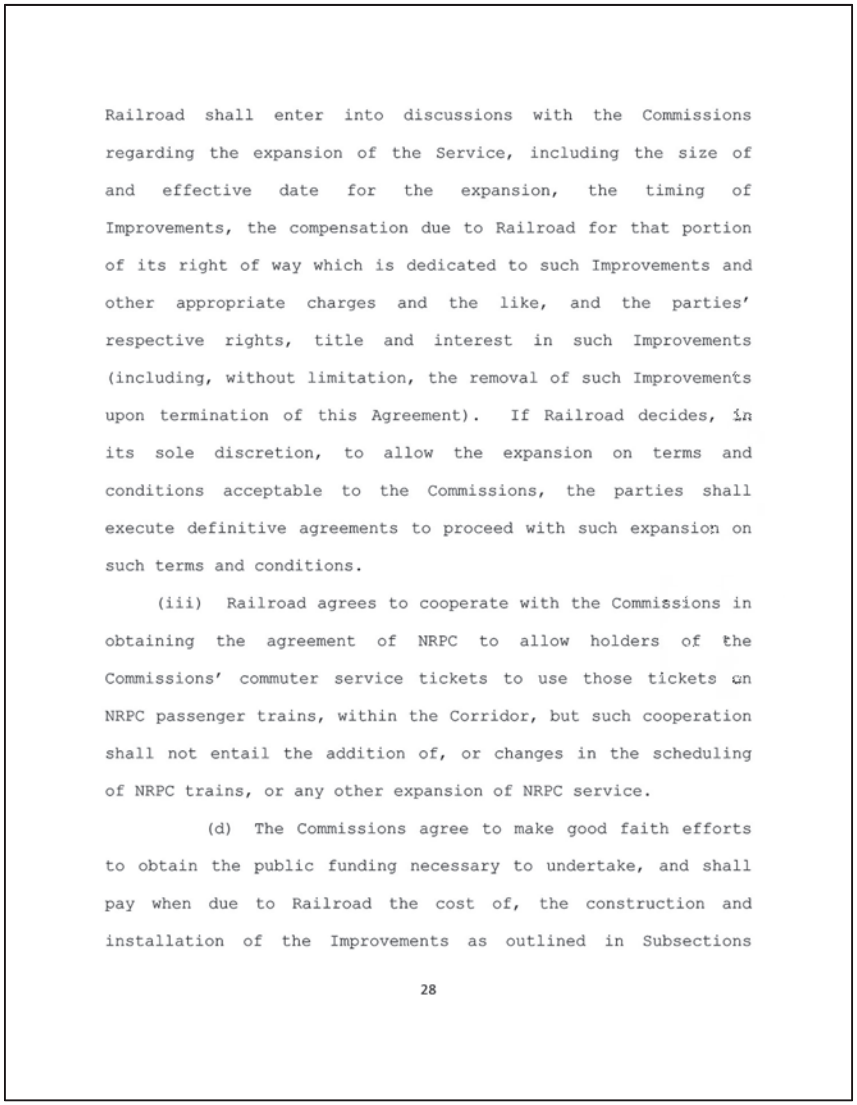
CSXT (continued)



acknowledge that the Railroad retains the right, in its sole discretion, to reject any proposal for expansion of the Service. Further expansion of the Service beyond the expansion contemplated by Section 2.9(b) shall not be allowed, unless and until the Commissions have committed to undertake, at no cost to Railroad, the construction of a third parallel mainline in the Corridor to be operated in coordination with the Railroad's existing double-track mainline system and such other improvement and as Railroad determines, in its sole judgment, to be necessary to ensure that commuter operations will not interfere with the freight operations or intercity passenger service. It is contemplated that the new mainline will be primarily utilized for commuter operations that that Railroad will be appropriately compensated for that portion of its right of way which is dedicated to such new mainline.

(ii) Accordingly, the Commissions may request further expansion of the Service beyond the level called for in Section 2.9(b) by presenting to Railroad evidence of the Commissions' commitment to implement and to fund, at no expense to Railroad, al or a significant portion of the aforesaid third mainline and such other Improvements as Railroad deems necessary to ensure that commuter operations will not interfere with freight and intercity passenger service operations. Upon such request,

CSXT (continued)

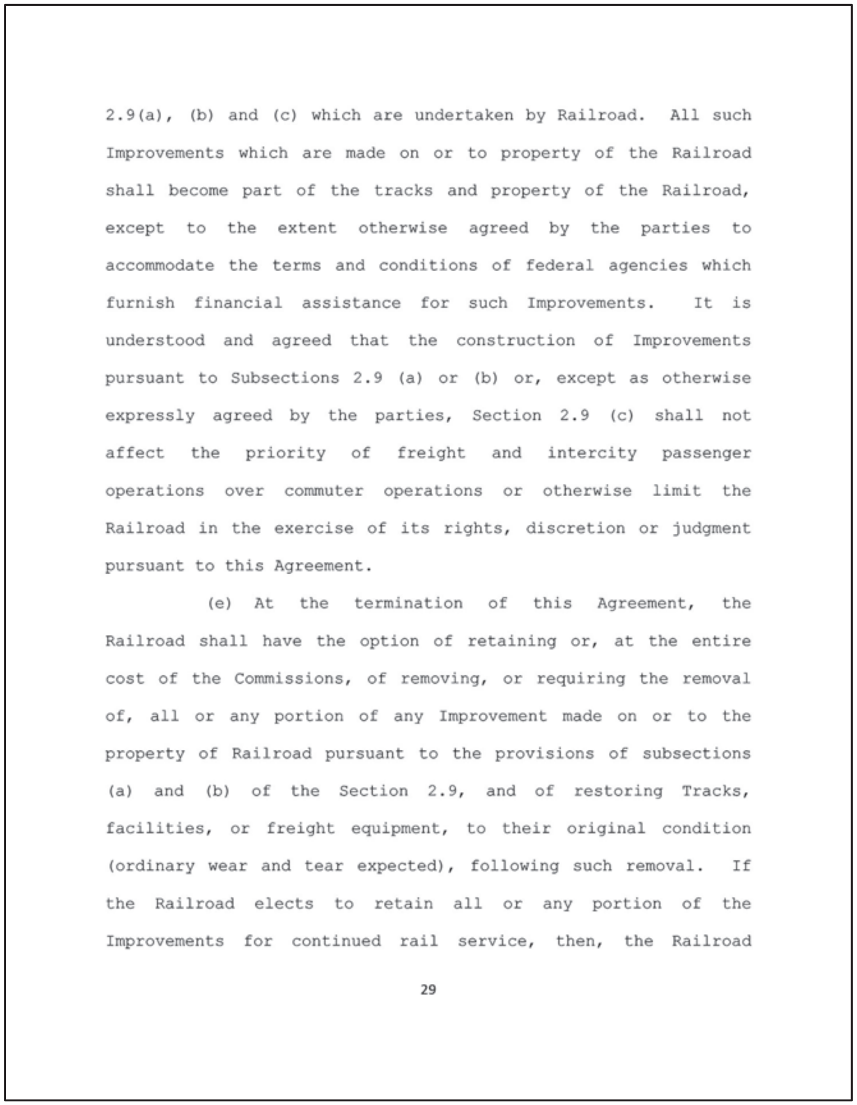


Railroad shall enter into discussions with the Commissions regarding the expansion of the Service, including the size of and effective date for the expansion, the timing of Improvements, the compensation due to Railroad for that portion of its right of way which is dedicated to such Improvements and other appropriate charges and the like, and the parties' respective rights, title and interest in such Improvements (including, without limitation, the removal of such Improvements upon termination of this Agreement). If Railroad decides, in its sole discretion, to allow the expansion on terms and conditions acceptable to the Commissions, the parties shall execute definitive agreements to proceed with such expansion on such terms and conditions.

(iii) Railroad agrees to cooperate with the Commissions in obtaining the agreement of NRPC to allow holders of the Commissions' commuter service tickets to use those tickets on NRPC passenger trains, within the Corridor, but such cooperation shall not entail the addition of, or changes in the scheduling of NRPC trains, or any other expansion of NRPC service.

(d) The Commissions agree to make good faith efforts to obtain the public funding necessary to undertake, and shall pay when due to Railroad the cost of, the construction and installation of the Improvements as outlined in Subsections

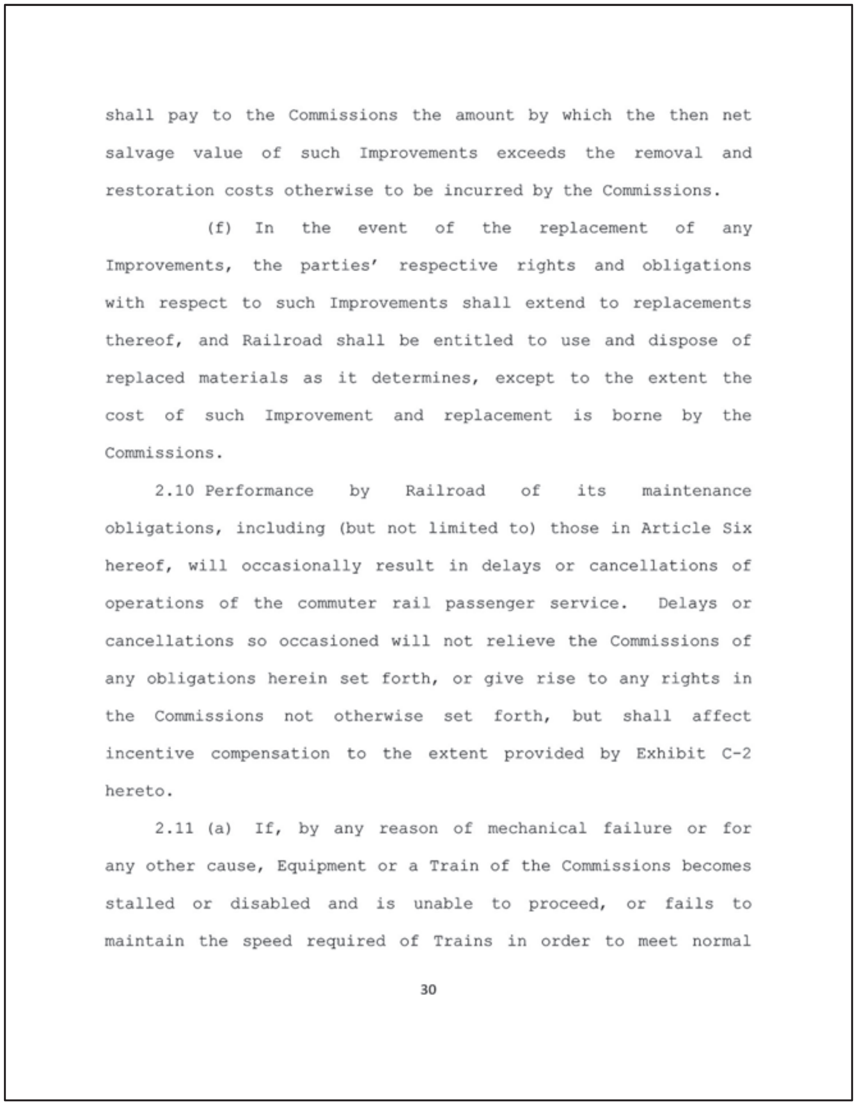
CSXT (continued)



2.9(a), (b) and (c) which are undertaken by Railroad. All such Improvements which are made on or to property of the Railroad shall become part of the tracks and property of the Railroad, except to the extent otherwise agreed by the parties to accommodate the terms and conditions of federal agencies which furnish financial assistance for such Improvements. It is understood and agreed that the construction of Improvements pursuant to Subsections 2.9 (a) or (b) or, except as otherwise expressly agreed by the parties, Section 2.9 (c) shall not affect the priority of freight and intercity passenger operations over commuter operations or otherwise limit the Railroad in the exercise of its rights, discretion or judgment pursuant to this Agreement.

(e) At the termination of this Agreement, the Railroad shall have the option of retaining or, at the entire cost of the Commissions, of removing, or requiring the removal of, all or any portion of any Improvement made on or to the property of Railroad pursuant to the provisions of subsections (a) and (b) of the Section 2.9, and of restoring Tracks, facilities, or freight equipment, to their original condition (ordinary wear and tear expected), following such removal. If the Railroad elects to retain all or any portion of the Improvements for continued rail service, then, the Railroad

CSXT (continued)



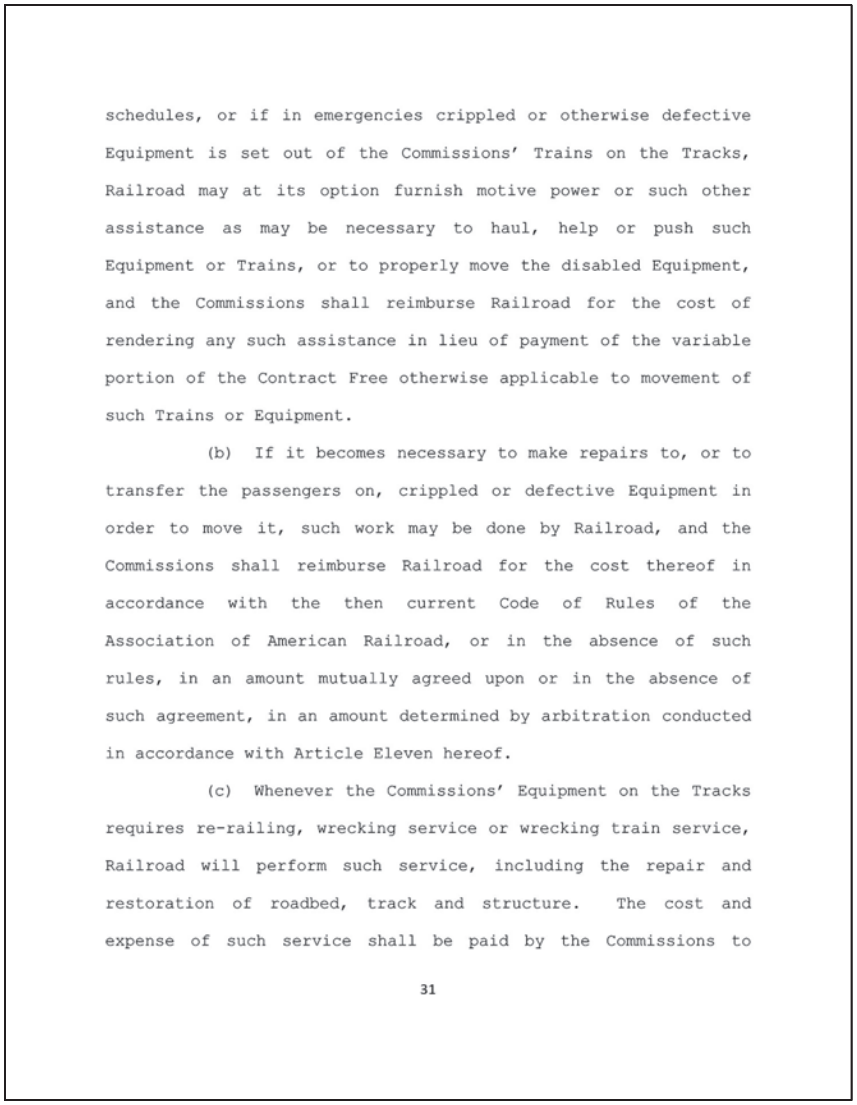
shall pay to the Commissions the amount by which the then net salvage value of such Improvements exceeds the removal and restoration costs otherwise to be incurred by the Commissions.

(f) In the event of the replacement of any Improvements, the parties' respective rights and obligations with respect to such Improvements shall extend to replacements thereof, and Railroad shall be entitled to use and dispose of replaced materials as it determines, except to the extent the cost of such Improvement and replacement is borne by the Commissions.

2.10 Performance by Railroad of its maintenance obligations, including (but not limited to) those in Article Six hereof, will occasionally result in delays or cancellations of operations of the commuter rail passenger service. Delays or cancellations so occasioned will not relieve the Commissions of any obligations herein set forth, or give rise to any rights in the Commissions not otherwise set forth, but shall affect incentive compensation to the extent provided by Exhibit C-2 hereto.

2.11 (a) If, by any reason of mechanical failure or for any other cause, Equipment or a Train of the Commissions becomes stalled or disabled and is unable to proceed, or fails to maintain the speed required of Trains in order to meet normal

CSXT (continued)

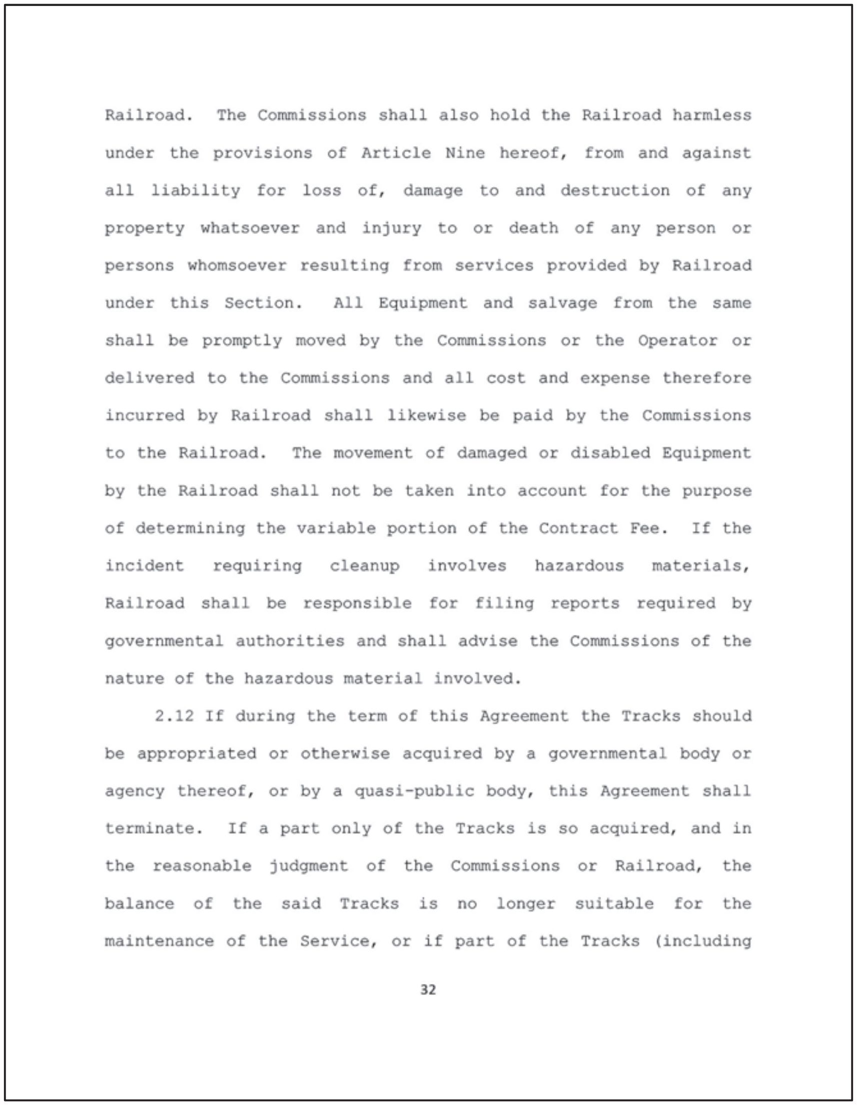


schedules, or if in emergencies crippled or otherwise defective Equipment is set out of the Commissions' Trains on the Tracks, Railroad may at its option furnish motive power or such other assistance as may be necessary to haul, help or push such Equipment or Trains, or to properly move the disabled Equipment, and the Commissions shall reimburse Railroad for the cost of rendering any such assistance in lieu of payment of the variable portion of the Contract Free otherwise applicable to movement of such Trains or Equipment.

(b) If it becomes necessary to make repairs to, or to transfer the passengers on, crippled or defective Equipment in order to move it, such work may be done by Railroad, and the Commissions shall reimburse Railroad for the cost thereof in accordance with the then current Code of Rules of the Association of American Railroad, or in the absence of such rules, in an amount mutually agreed upon or in the absence of such agreement, in an amount determined by arbitration conducted in accordance with Article Eleven hereof.

(c) Whenever the Commissions' Equipment on the Tracks requires re-railing, wrecking service or wrecking train service, Railroad will perform such service, including the repair and restoration of roadbed, track and structure. The cost and expense of such service shall be paid by the Commissions to

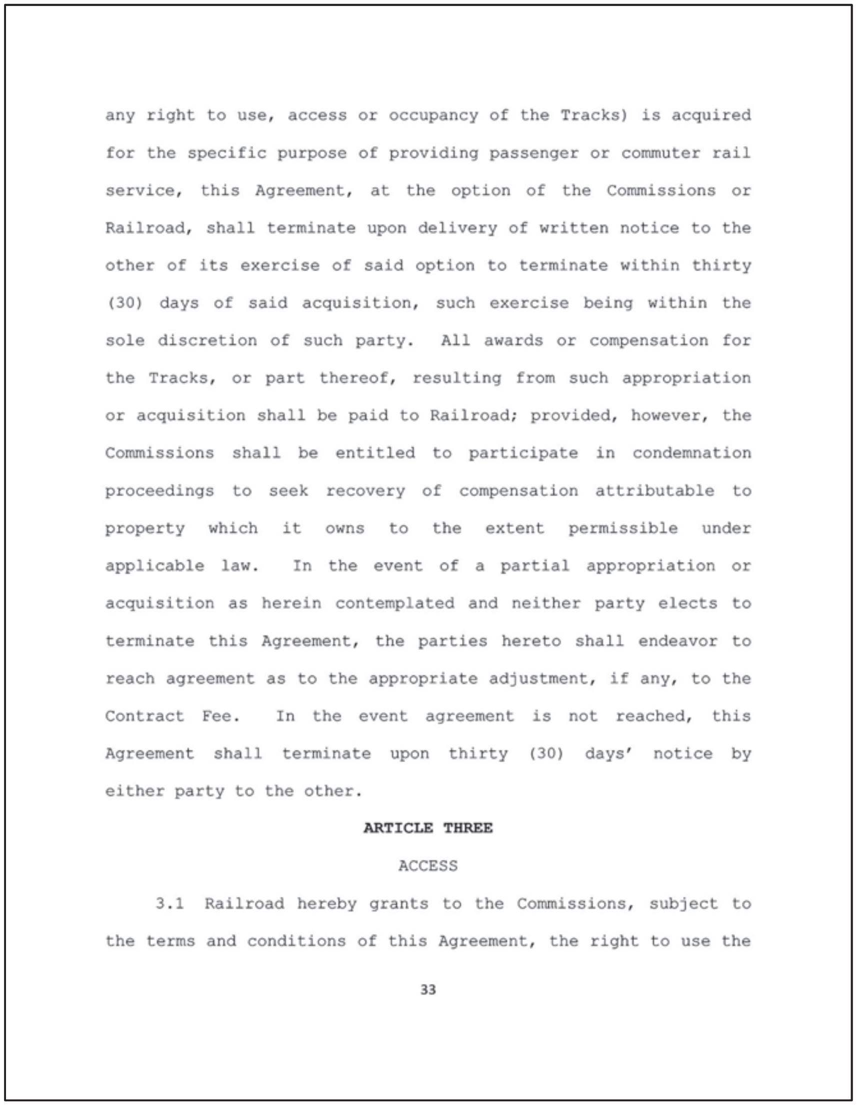
CSXT (continued)



Railroad. The Commissions shall also hold the Railroad harmless under the provisions of Article Nine hereof, from and against all liability for loss of, damage to and destruction of any property whatsoever and injury to or death of any person or persons whomsoever resulting from services provided by Railroad under this Section. All Equipment and salvage from the same shall be promptly moved by the Commissions or the Operator or delivered to the Commissions and all cost and expense therefore incurred by Railroad shall likewise be paid by the Commissions to the Railroad. The movement of damaged or disabled Equipment by the Railroad shall not be taken into account for the purpose of determining the variable portion of the Contract Fee. If the incident requiring cleanup involves hazardous materials, Railroad shall be responsible for filing reports required by governmental authorities and shall advise the Commissions of the nature of the hazardous material involved.

2.12 If during the term of this Agreement the Tracks should be appropriated or otherwise acquired by a governmental body or agency thereof, or by a quasi-public body, this Agreement shall terminate. If a part only of the Tracks is so acquired, and in the reasonable judgment of the Commissions or Railroad, the balance of the said Tracks is no longer suitable for the maintenance of the Service, or if part of the Tracks (including

CSXT (continued)



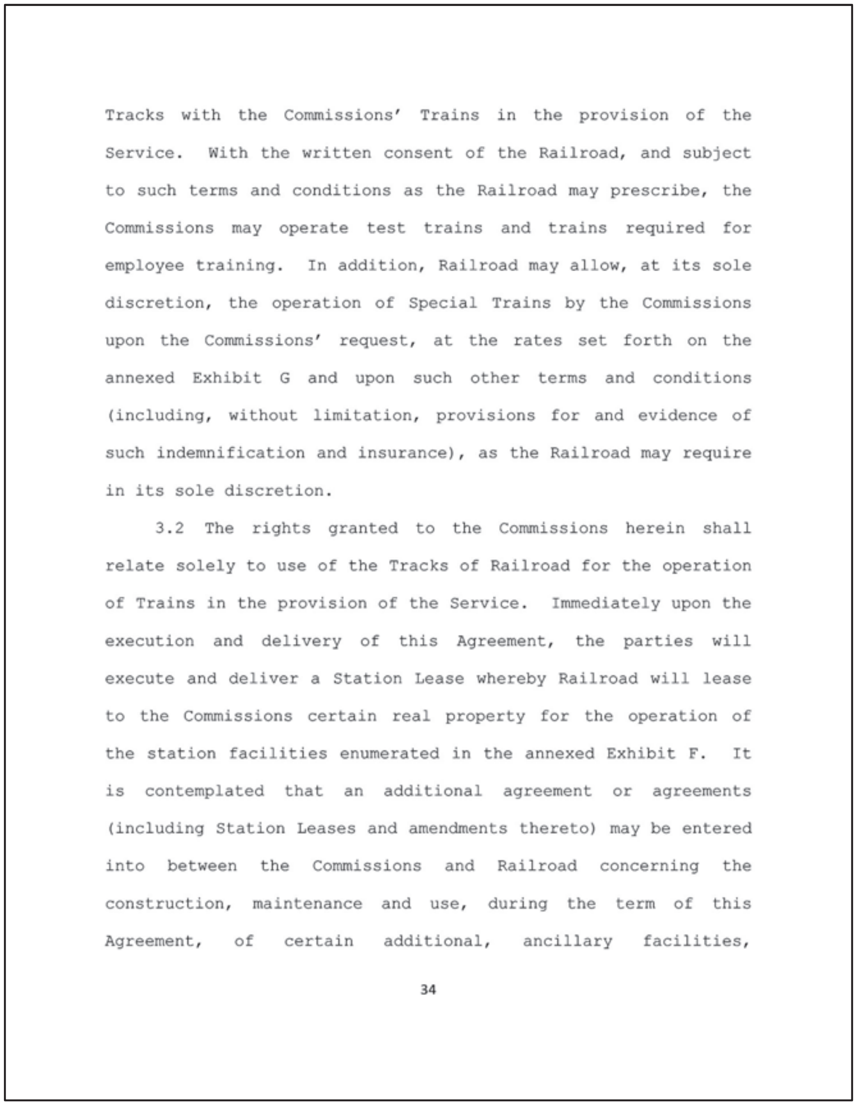
any right to use, access or occupancy of the Tracks) is acquired for the specific purpose of providing passenger or commuter rail service, this Agreement, at the option of the Commissions or Railroad, shall terminate upon delivery of written notice to the other of its exercise of said option to terminate within thirty (30) days of said acquisition, such exercise being within the sole discretion of such party. All awards or compensation for the Tracks, or part thereof, resulting from such appropriation or acquisition shall be paid to Railroad; provided, however, the Commissions shall be entitled to participate in condemnation proceedings to seek recovery of compensation attributable to property which it owns to the extent permissible under applicable law. In the event of a partial appropriation or acquisition as herein contemplated and neither party elects to terminate this Agreement, the parties hereto shall endeavor to reach agreement as to the appropriate adjustment, if any, to the Contract Fee. In the event agreement is not reached, this Agreement shall terminate upon thirty (30) days' notice by either party to the other.

ARTICLE THREE

ACCESS

3.1 Railroad hereby grants to the Commissions, subject to the terms and conditions of this Agreement, the right to use the

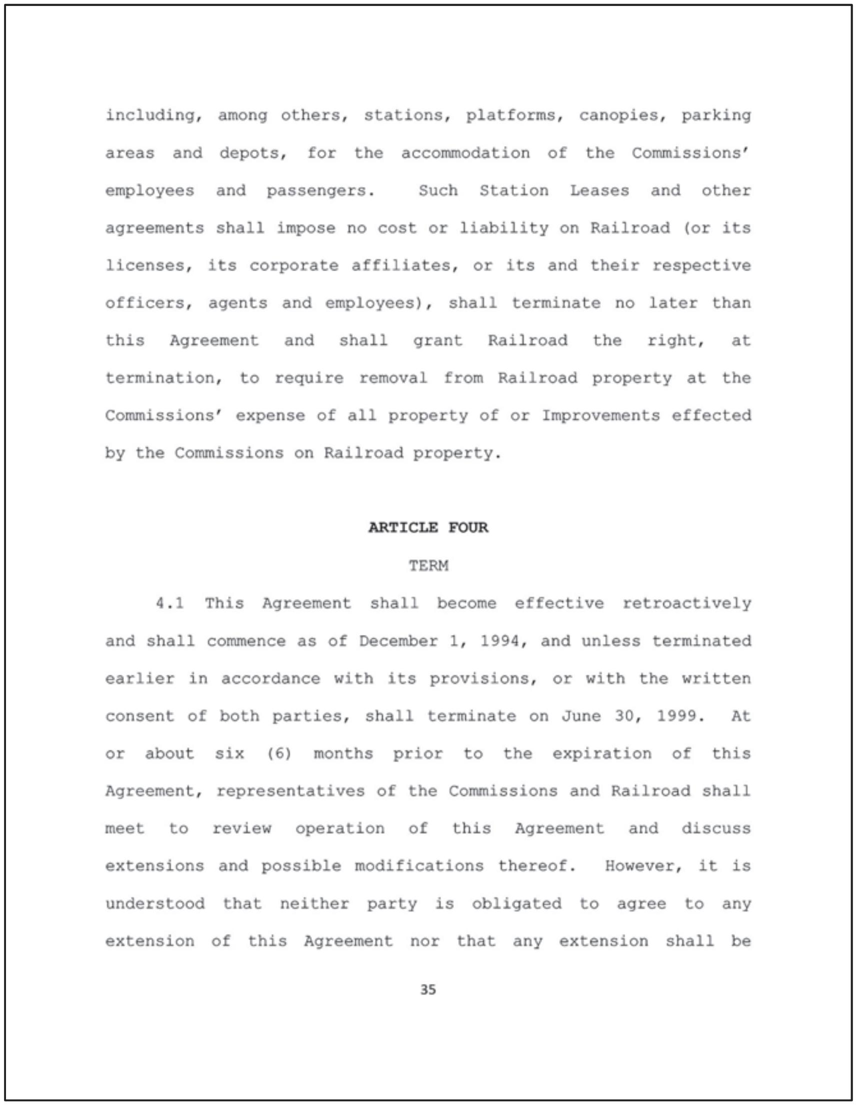
CSXT (continued)



Tracks with the Commissions' Trains in the provision of the Service. With the written consent of the Railroad, and subject to such terms and conditions as the Railroad may prescribe, the Commissions may operate test trains and trains required for employee training. In addition, Railroad may allow, at its sole discretion, the operation of Special Trains by the Commissions upon the Commissions' request, at the rates set forth on the annexed Exhibit G and upon such other terms and conditions (including, without limitation, provisions for and evidence of such indemnification and insurance), as the Railroad may require in its sole discretion.

3.2 The rights granted to the Commissions herein shall relate solely to use of the Tracks of Railroad for the operation of Trains in the provision of the Service. Immediately upon the execution and delivery of this Agreement, the parties will execute and deliver a Station Lease whereby Railroad will lease to the Commissions certain real property for the operation of the station facilities enumerated in the annexed Exhibit F. It is contemplated that an additional agreement or agreements (including Station Leases and amendments thereto) may be entered into between the Commissions and Railroad concerning the construction, maintenance and use, during the term of this Agreement, of certain additional, ancillary facilities,

CSXT (continued)



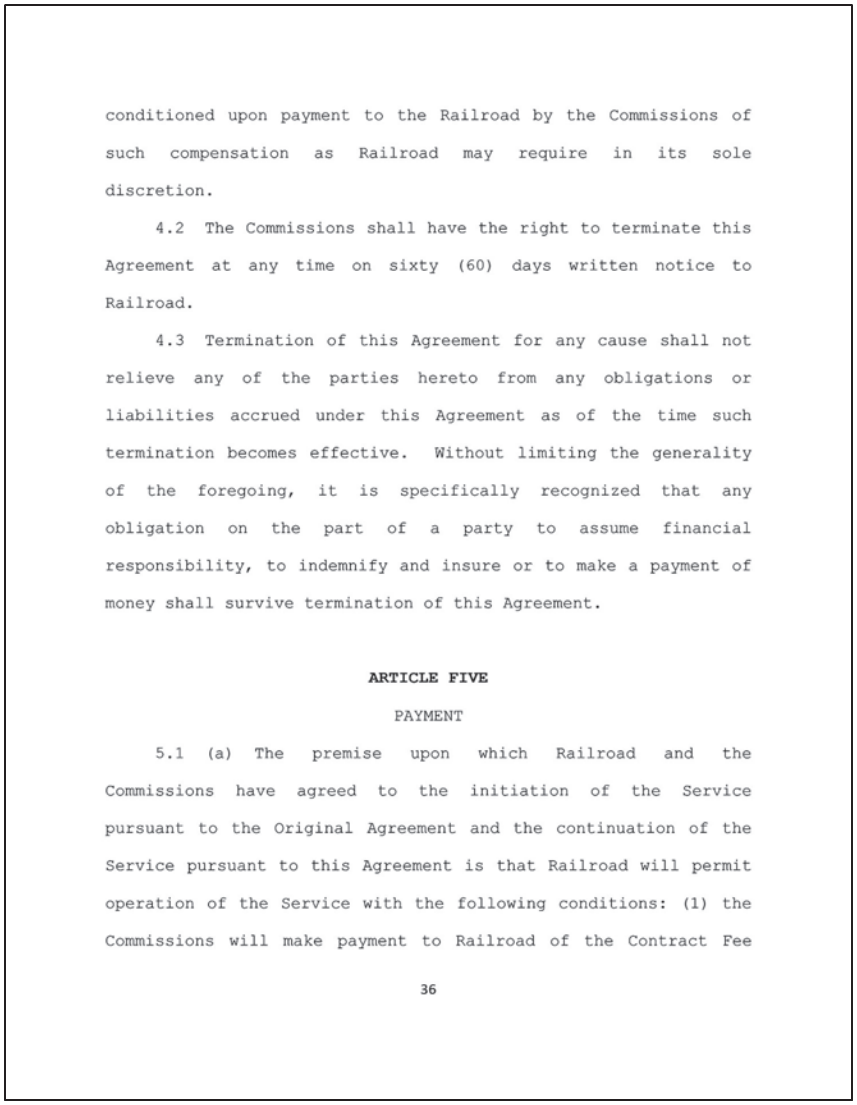
including, among others, stations, platforms, canopies, parking areas and depots, for the accommodation of the Commissions' employees and passengers. Such Station Leases and other agreements shall impose no cost or liability on Railroad (or its licenses, its corporate affiliates, or its and their respective officers, agents and employees), shall terminate no later than this Agreement and shall grant Railroad the right, at termination, to require removal from Railroad property at the Commissions' expense of all property of or Improvements effected by the Commissions on Railroad property.

ARTICLE FOUR

TERM

4.1 This Agreement shall become effective retroactively and shall commence as of December 1, 1994, and unless terminated earlier in accordance with its provisions, or with the written consent of both parties, shall terminate on June 30, 1999. At or about six (6) months prior to the expiration of this Agreement, representatives of the Commissions and Railroad shall meet to review operation of this Agreement and discuss extensions and possible modifications thereof. However, it is understood that neither party is obligated to agree to any extension of this Agreement nor that any extension shall be

CSXT (continued)



conditioned upon payment to the Railroad by the Commissions of such compensation as Railroad may require in its sole discretion.

4.2 The Commissions shall have the right to terminate this Agreement at any time on sixty (60) days written notice to Railroad.

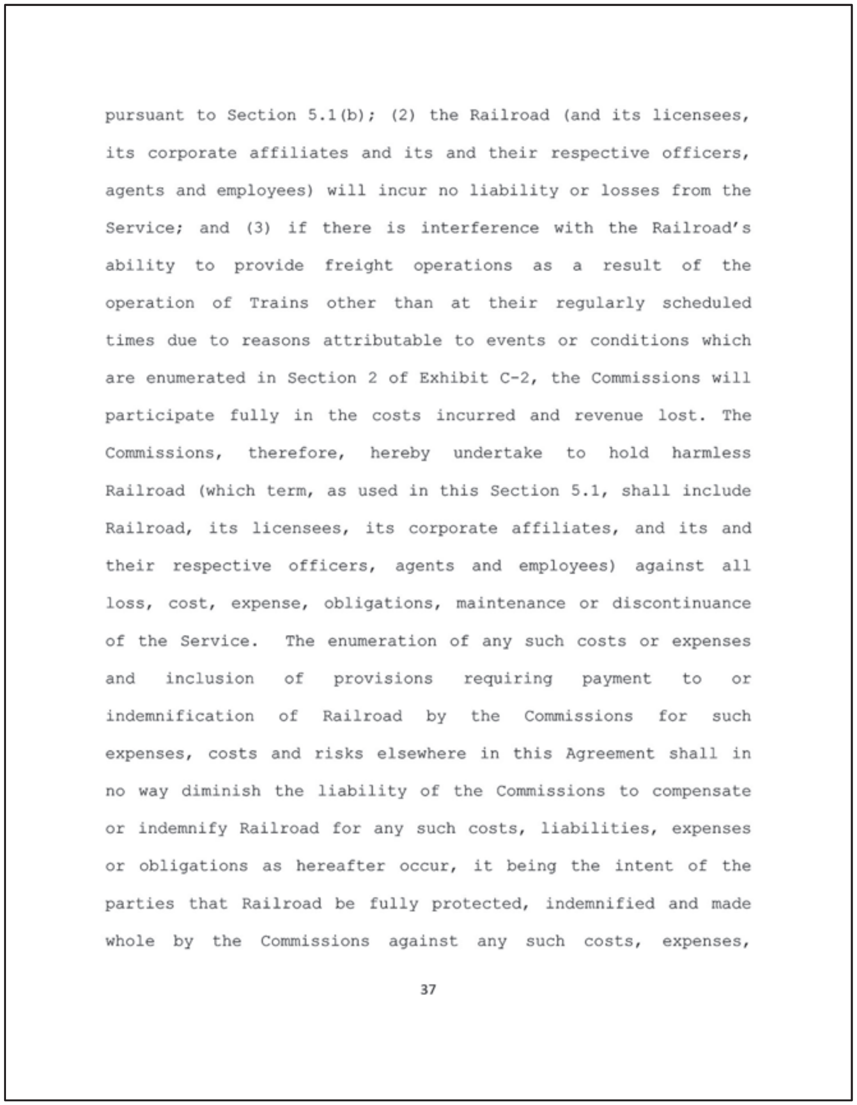
4.3 Termination of this Agreement for any cause shall not relieve any of the parties hereto from any obligations or liabilities accrued under this Agreement as of the time such termination becomes effective. Without limiting the generality of the foregoing, it is specifically recognized that any obligation on the part of a party to assume financial responsibility, to indemnify and insure or to make a payment of money shall survive termination of this Agreement.

ARTICLE FIVE

PAYMENT

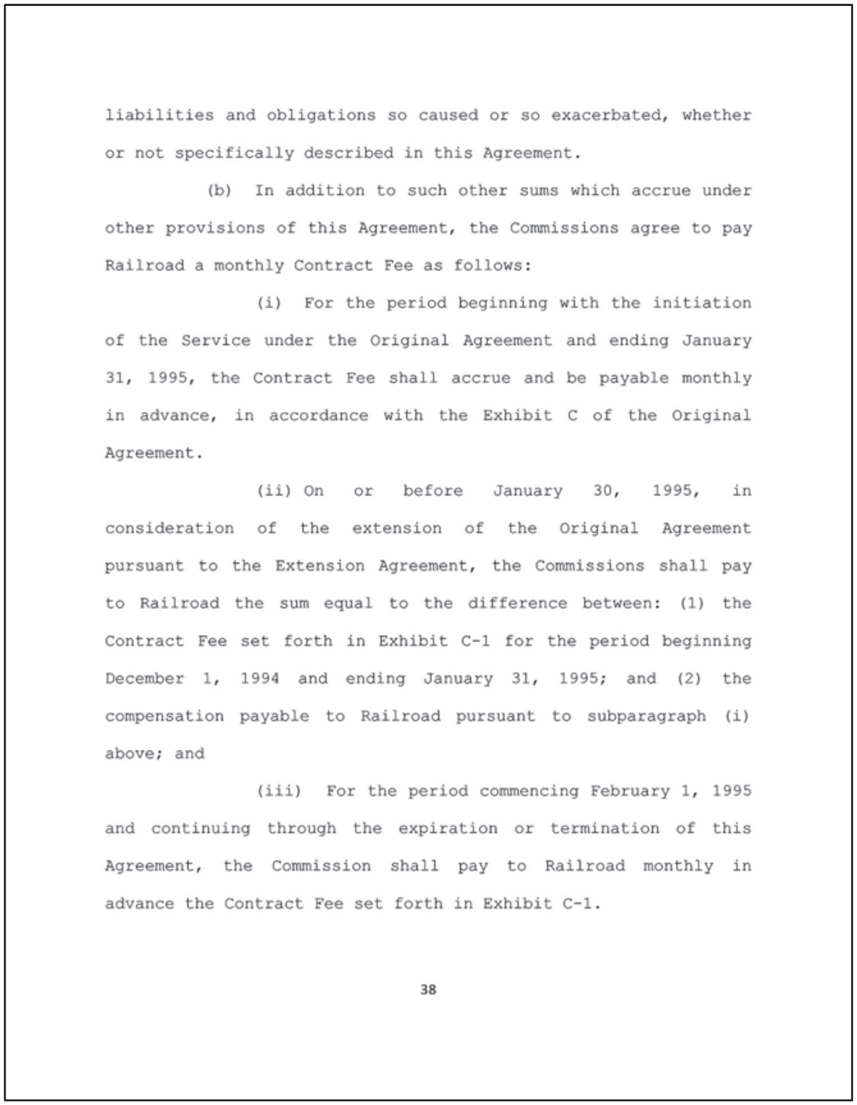
5.1 (a) The premise upon which Railroad and the Commissions have agreed to the initiation of the Service pursuant to the Original Agreement and the continuation of the Service pursuant to this Agreement is that Railroad will permit operation of the Service with the following conditions: (1) the Commissions will make payment to Railroad of the Contract Fee

CSXT (continued)



pursuant to Section 5.1(b); (2) the Railroad (and its licensees, its corporate affiliates and its and their respective officers, agents and employees) will incur no liability or losses from the Service; and (3) if there is interference with the Railroad's ability to provide freight operations as a result of the operation of Trains other than at their regularly scheduled times due to reasons attributable to events or conditions which are enumerated in Section 2 of Exhibit C-2, the Commissions will participate fully in the costs incurred and revenue lost. The Commissions, therefore, hereby undertake to hold harmless Railroad (which term, as used in this Section 5.1, shall include Railroad, its licensees, its corporate affiliates, and its and their respective officers, agents and employees) against all loss, cost, expense, obligations, maintenance or discontinuance of the Service. The enumeration of any such costs or expenses and inclusion of provisions requiring payment to or indemnification of Railroad by the Commissions for such expenses, costs and risks elsewhere in this Agreement shall in no way diminish the liability of the Commissions to compensate or indemnify Railroad for any such costs, liabilities, expenses or obligations as hereafter occur, it being the intent of the parties that Railroad be fully protected, indemnified and made whole by the Commissions against any such costs, expenses,

CSXT (continued)



liabilities and obligations so caused or so exacerbated, whether or not specifically described in this Agreement.

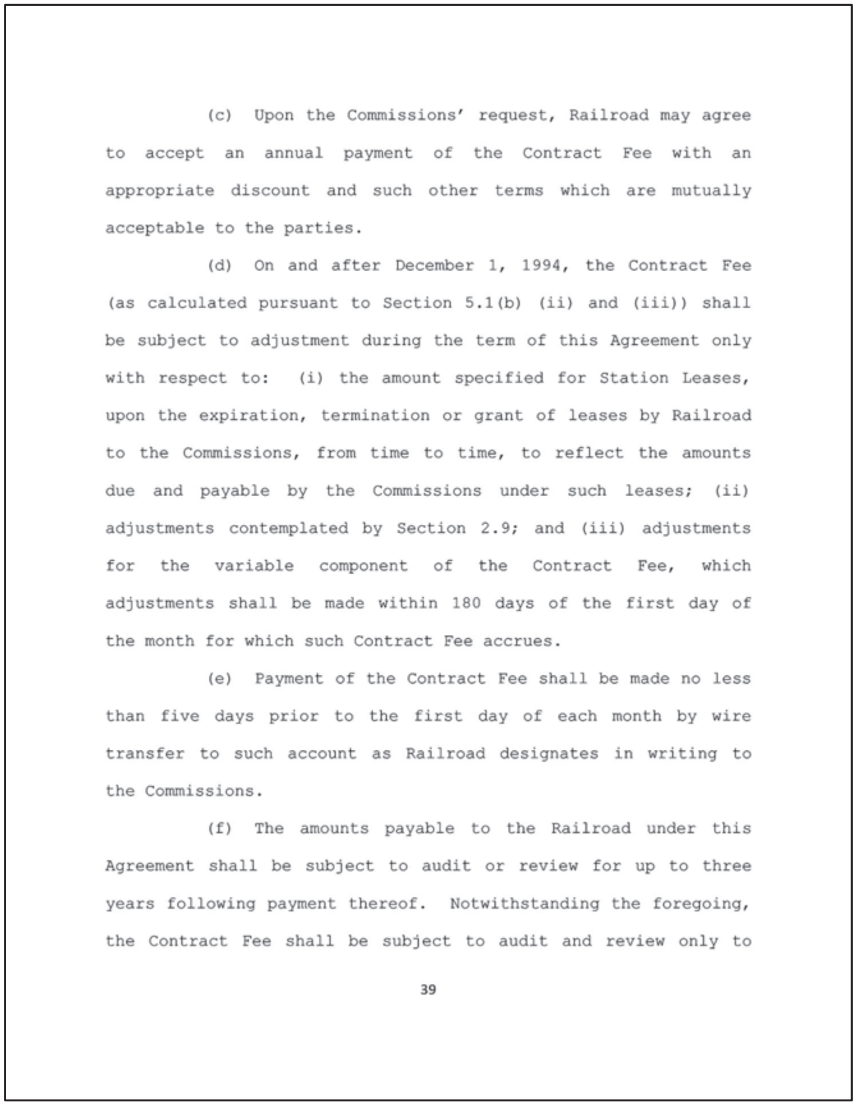
(b) In addition to such other sums which accrue under other provisions of this Agreement, the Commissions agree to pay Railroad a monthly Contract Fee as follows:

(i) For the period beginning with the initiation of the Service under the Original Agreement and ending January 31, 1995, the Contract Fee shall accrue and be payable monthly in advance, in accordance with the Exhibit C of the Original Agreement.

(ii) On or before January 30, 1995, in consideration of the extension of the Original Agreement pursuant to the Extension Agreement, the Commissions shall pay to Railroad the sum equal to the difference between: (1) the Contract Fee set forth in Exhibit C-1 for the period beginning December 1, 1994 and ending January 31, 1995; and (2) the compensation payable to Railroad pursuant to subparagraph (i) above; and

(iii) For the period commencing February 1, 1995 and continuing through the expiration or termination of this Agreement, the Commission shall pay to Railroad monthly in advance the Contract Fee set forth in Exhibit C-1.

CSXT (continued)



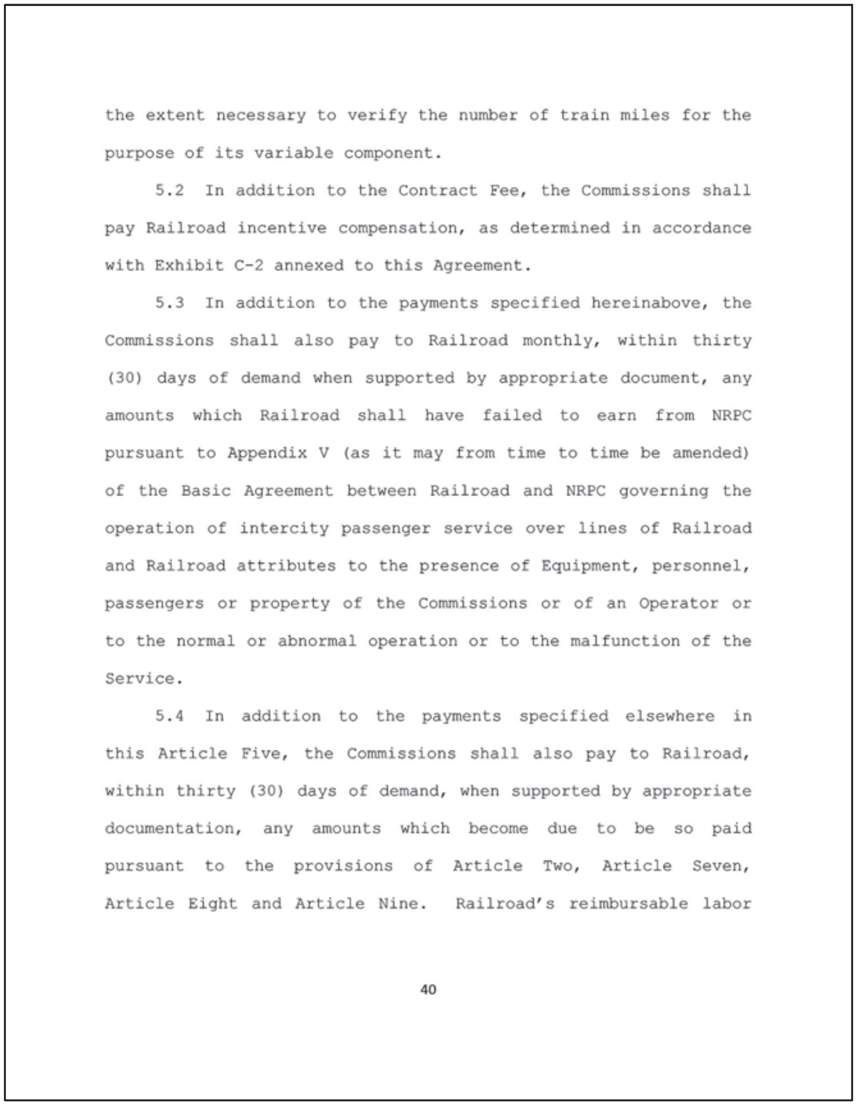
(c) Upon the Commissions' request, Railroad may agree to accept an annual payment of the Contract Fee with an appropriate discount and such other terms which are mutually acceptable to the parties.

(d) On and after December 1, 1994, the Contract Fee (as calculated pursuant to Section 5.1(b) (ii) and (iii)) shall be subject to adjustment during the term of this Agreement only with respect to: (i) the amount specified for Station Leases, upon the expiration, termination or grant of leases by Railroad to the Commissions, from time to time, to reflect the amounts due and payable by the Commissions under such leases; (ii) adjustments contemplated by Section 2.9; and (iii) adjustments for the variable component of the Contract Fee, which adjustments shall be made within 180 days of the first day of the month for which such Contract Fee accrues.

(e) Payment of the Contract Fee shall be made no less than five days prior to the first day of each month by wire transfer to such account as Railroad designates in writing to the Commissions.

(f) The amounts payable to the Railroad under this Agreement shall be subject to audit or review for up to three years following payment thereof. Notwithstanding the foregoing, the Contract Fee shall be subject to audit and review only to

CSXT (continued)



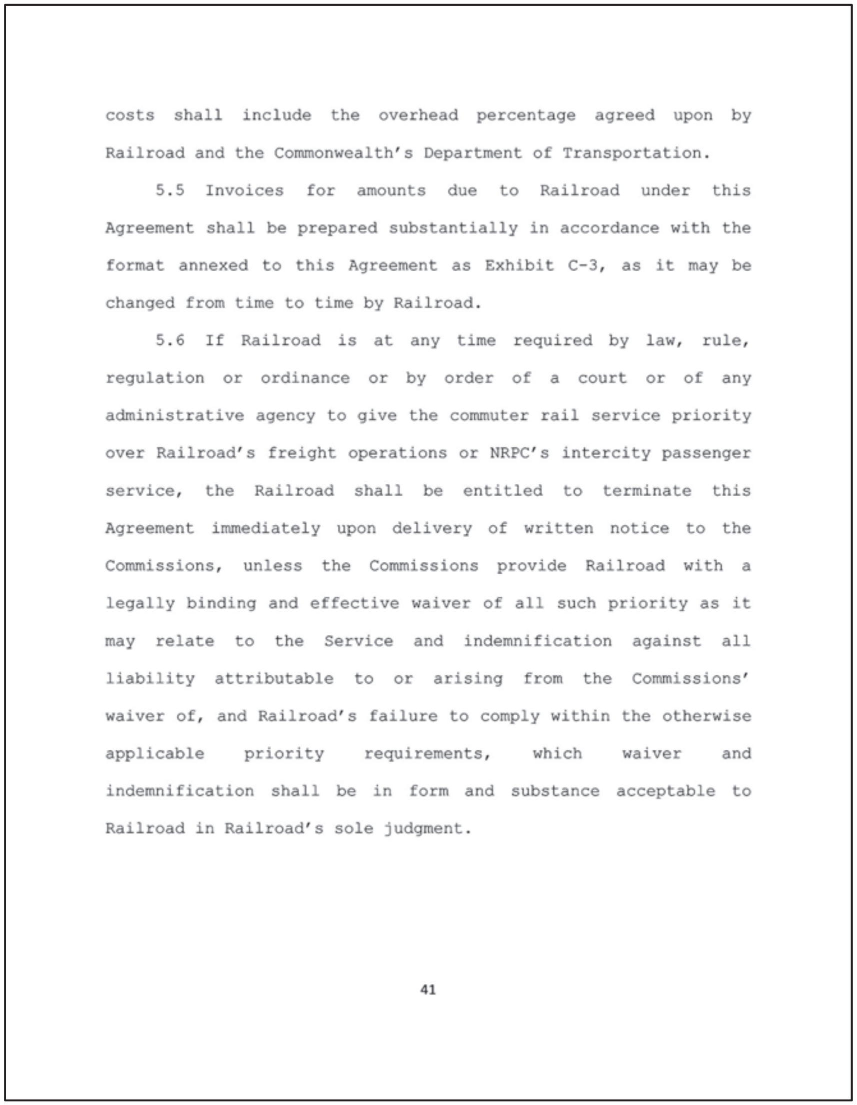
the extent necessary to verify the number of train miles for the purpose of its variable component.

5.2 In addition to the Contract Fee, the Commissions shall pay Railroad incentive compensation, as determined in accordance with Exhibit C-2 annexed to this Agreement.

5.3 In addition to the payments specified hereinabove, the Commissions shall also pay to Railroad monthly, within thirty (30) days of demand when supported by appropriate document, any amounts which Railroad shall have failed to earn from NRPC pursuant to Appendix V (as it may from time to time be amended) of the Basic Agreement between Railroad and NRPC governing the operation of intercity passenger service over lines of Railroad and Railroad attributes to the presence of Equipment, personnel, passengers or property of the Commissions or of an Operator or to the normal or abnormal operation or to the malfunction of the Service.

5.4 In addition to the payments specified elsewhere in this Article Five, the Commissions shall also pay to Railroad, within thirty (30) days of demand, when supported by appropriate documentation, any amounts which become due to be so paid pursuant to the provisions of Article Two, Article Seven, Article Eight and Article Nine. Railroad's reimbursable labor

CSXT (continued)

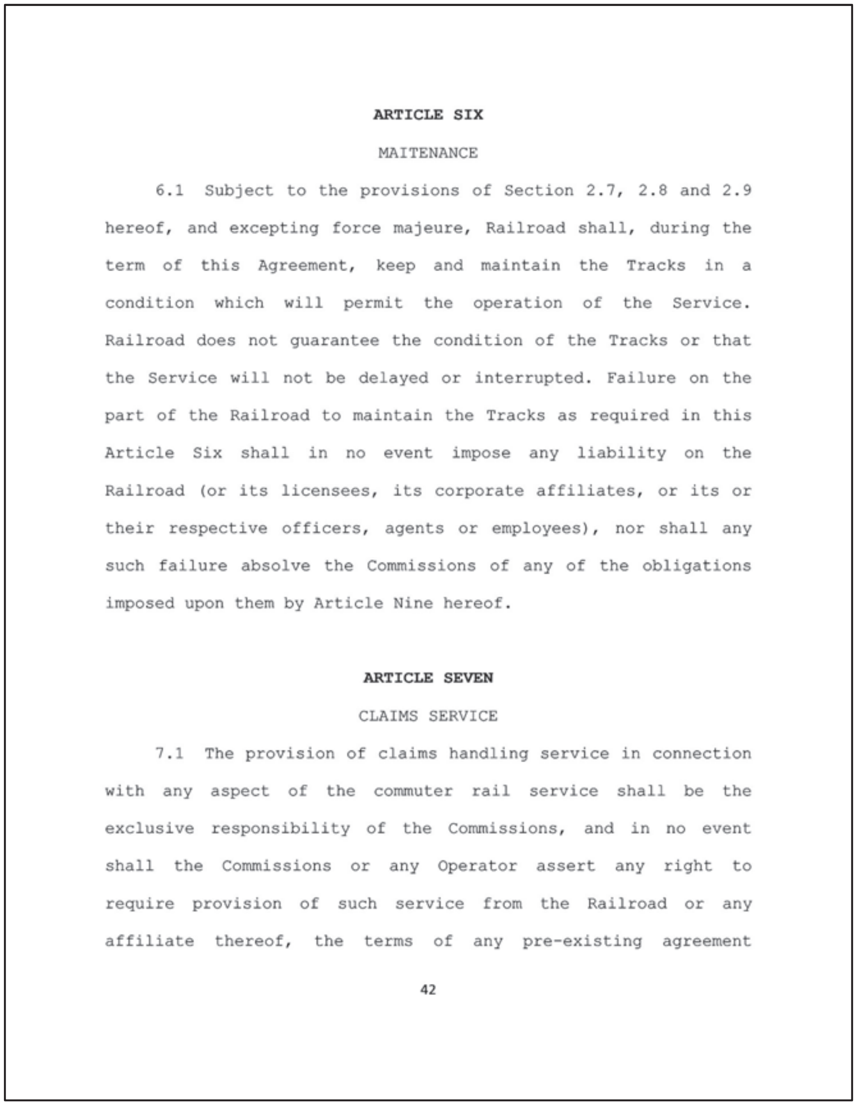


costs shall include the overhead percentage agreed upon by Railroad and the Commonwealth's Department of Transportation.

5.5 Invoices for amounts due to Railroad under this Agreement shall be prepared substantially in accordance with the format annexed to this Agreement as Exhibit C-3, as it may be changed from time to time by Railroad.

5.6 If Railroad is at any time required by law, rule, regulation or ordinance or by order of a court or of any administrative agency to give the commuter rail service priority over Railroad's freight operations or NRPC's intercity passenger service, the Railroad shall be entitled to terminate this Agreement immediately upon delivery of written notice to the Commissions, unless the Commissions provide Railroad with a legally binding and effective waiver of all such priority as it may relate to the Service and indemnification against all liability attributable to or arising from the Commissions' waiver of, and Railroad's failure to comply within the otherwise applicable priority requirements, which waiver and indemnification shall be in form and substance acceptable to Railroad in Railroad's sole judgment.

CSXT (continued)



ARTICLE SIX

MAITENANCE

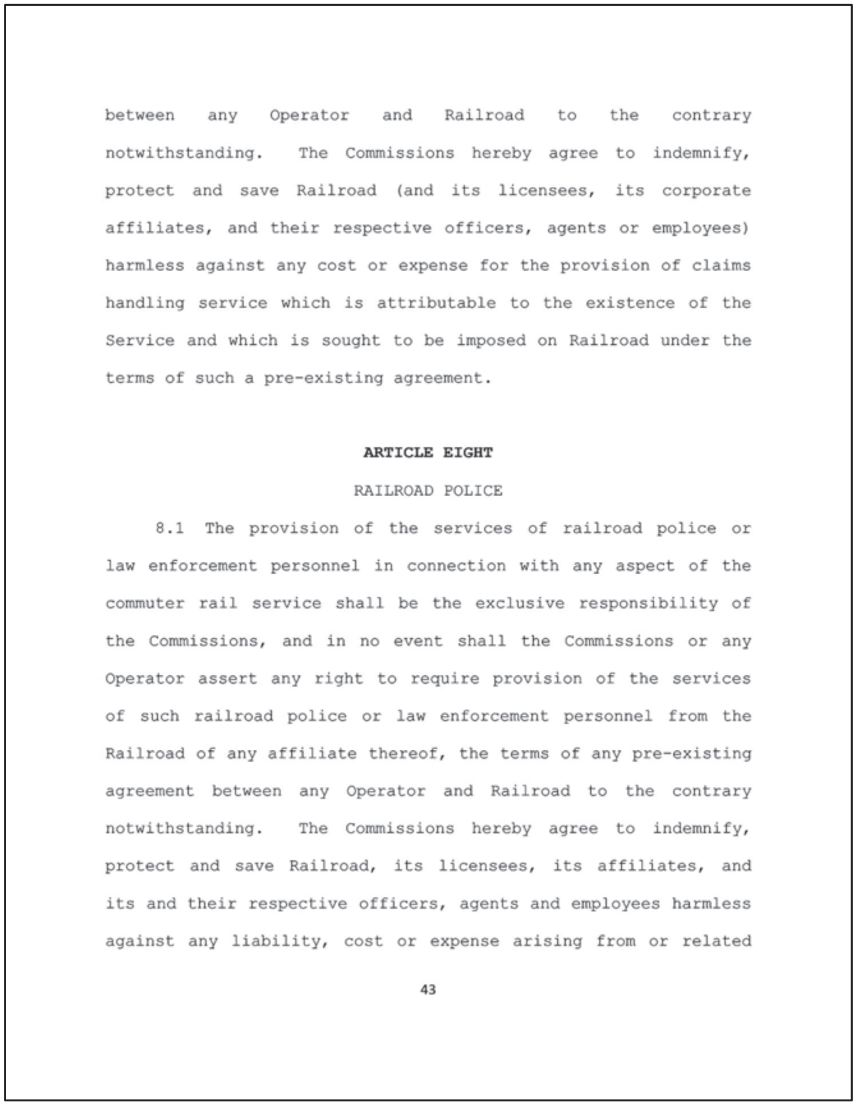
6.1 Subject to the provisions of Section 2.7, 2.8 and 2.9 hereof, and excepting force majeure, Railroad shall, during the term of this Agreement, keep and maintain the Tracks in a condition which will permit the operation of the Service. Railroad does not guarantee the condition of the Tracks or that the Service will not be delayed or interrupted. Failure on the part of the Railroad to maintain the Tracks as required in this Article Six shall in no event impose any liability on the Railroad (or its licensees, its corporate affiliates, or its or their respective officers, agents or employees), nor shall any such failure absolve the Commissions of any of the obligations imposed upon them by Article Nine hereof.

ARTICLE SEVEN

CLAIMS SERVICE

7.1 The provision of claims handling service in connection with any aspect of the commuter rail service shall be the exclusive responsibility of the Commissions, and in no event shall the Commissions or any Operator assert any right to require provision of such service from the Railroad or any affiliate thereof, the terms of any pre-existing agreement

CSXT (continued)



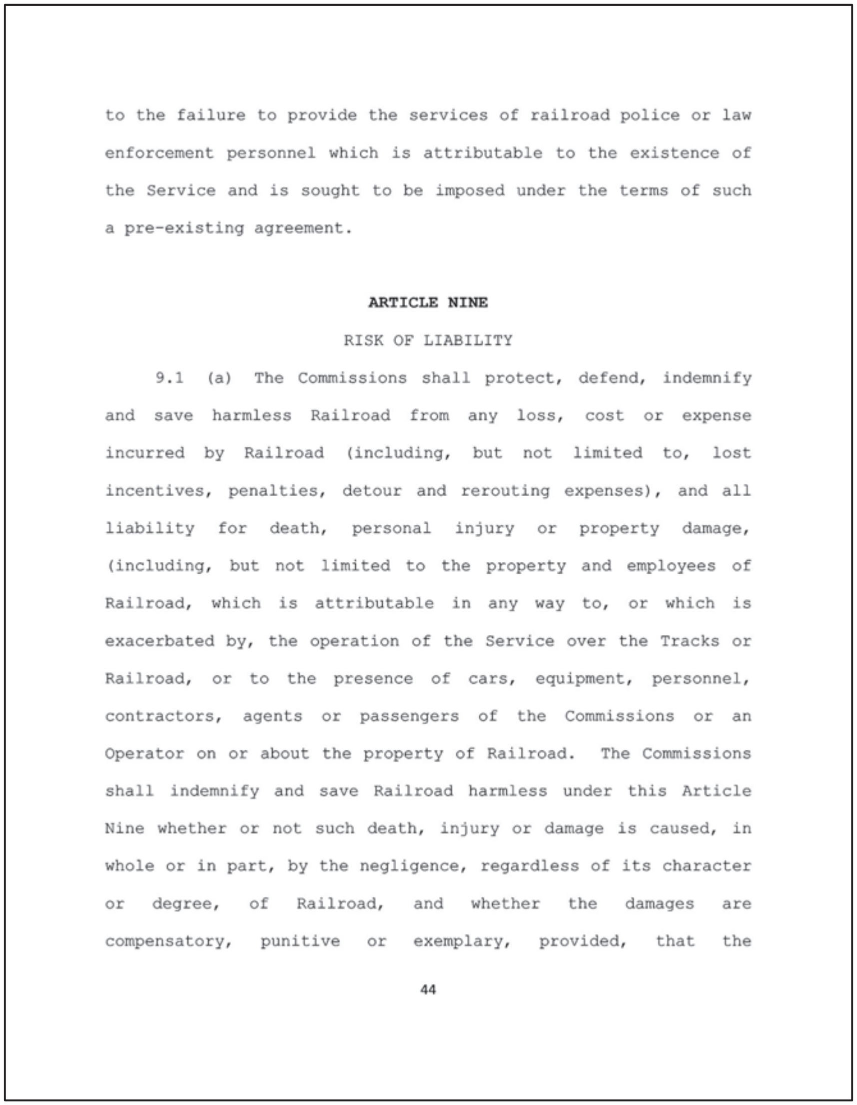
between any Operator and Railroad to the contrary notwithstanding. The Commissions hereby agree to indemnify, protect and save Railroad (and its licensees, its corporate affiliates, and their respective officers, agents or employees) harmless against any cost or expense for the provision of claims handling service which is attributable to the existence of the Service and which is sought to be imposed on Railroad under the terms of such a pre-existing agreement.

ARTICLE EIGHT

RAILROAD POLICE

8.1 The provision of the services of railroad police or law enforcement personnel in connection with any aspect of the commuter rail service shall be the exclusive responsibility of the Commissions, and in no event shall the Commissions or any Operator assert any right to require provision of the services of such railroad police or law enforcement personnel from the Railroad of any affiliate thereof, the terms of any pre-existing agreement between any Operator and Railroad to the contrary notwithstanding. The Commissions hereby agree to indemnify, protect and save Railroad, its licensees, its affiliates, and its and their respective officers, agents and employees harmless against any liability, cost or expense arising from or related

CSXT (continued)



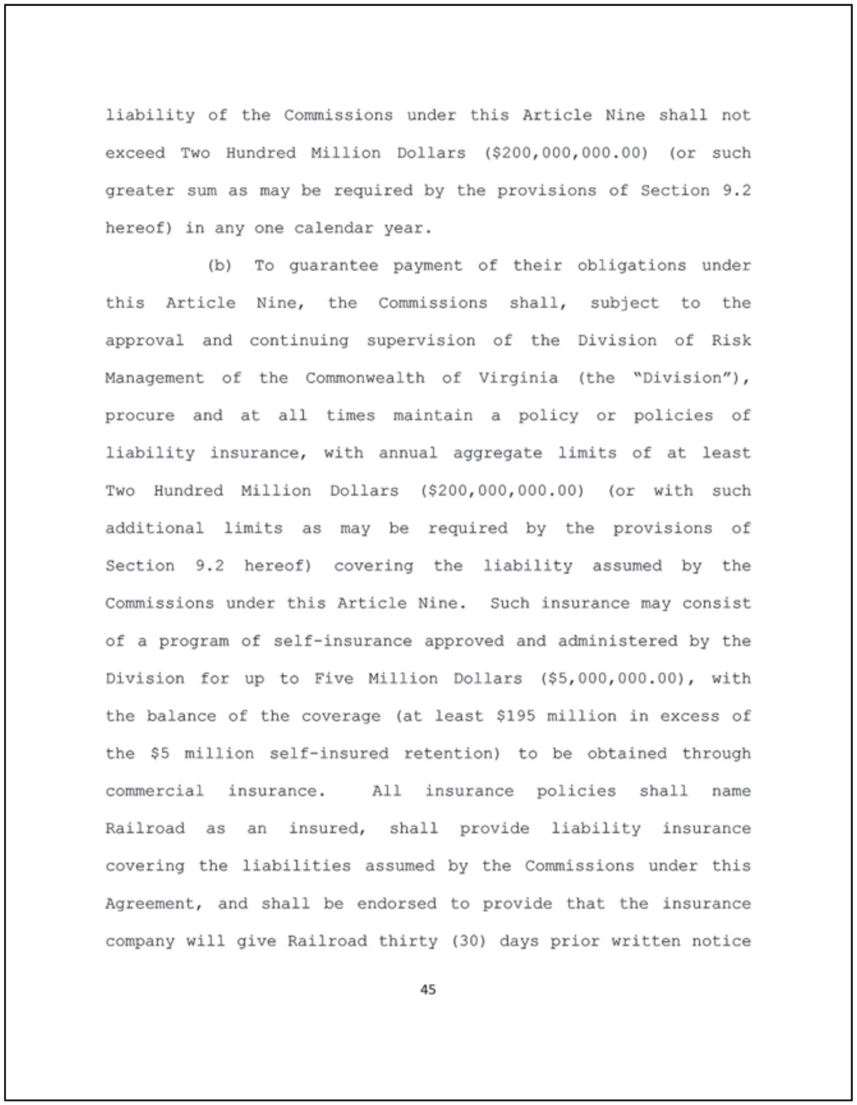
to the failure to provide the services of railroad police or law enforcement personnel which is attributable to the existence of the Service and is sought to be imposed under the terms of such a pre-existing agreement.

ARTICLE NINE

RISK OF LIABILITY

9.1 (a) The Commissions shall protect, defend, indemnify and save harmless Railroad from any loss, cost or expense incurred by Railroad (including, but not limited to, lost incentives, penalties, detour and rerouting expenses), and all liability for death, personal injury or property damage, (including, but not limited to the property and employees of Railroad, which is attributable in any way to, or which is exacerbated by, the operation of the Service over the Tracks or Railroad, or to the presence of cars, equipment, personnel, contractors, agents or passengers of the Commissions or an Operator on or about the property of Railroad. The Commissions shall indemnify and save Railroad harmless under this Article Nine whether or not such death, injury or damage is caused, in whole or in part, by the negligence, regardless of its character or degree, of Railroad, and whether the damages are compensatory, punitive or exemplary, provided, that the

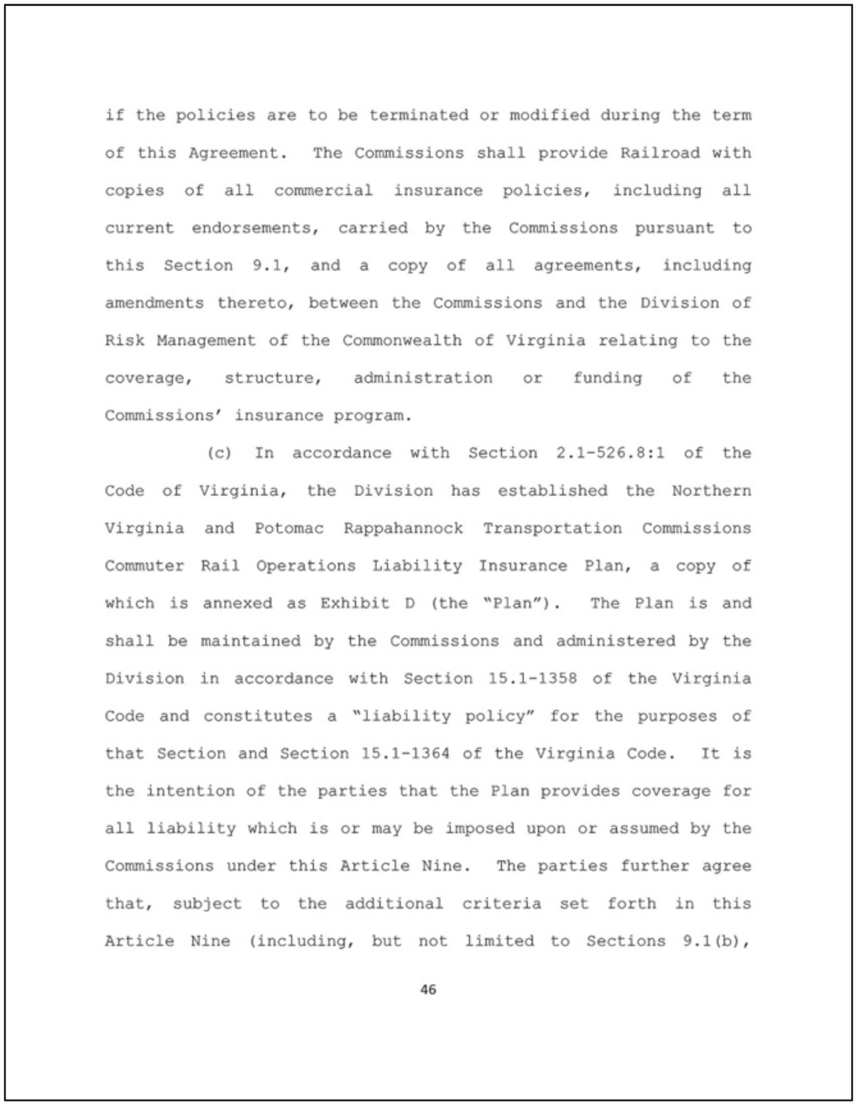
CSXT (continued)



liability of the Commissions under this Article Nine shall not exceed Two Hundred Million Dollars ($200,000,000.00) (or such greater sum as may be required by the provisions of Section 9.2 hereof) in any one calendar year.

(b) To guarantee payment of their obligations under this Article Nine, the Commissions shall, subject to the approval and continuing supervision of the Division of Risk Management of the Commonwealth of Virginia (the "Division"), procure and at all times maintain a policy or policies of liability insurance, with annual aggregate limits of at least Two Hundred Million Dollars ($200,000,000.00) (or with such additional limits as may be required by the provisions of Section 9.2 hereof) covering the liability assumed by the Commissions under this Article Nine. Such insurance may consist of a program of self-insurance approved and administered by the Division for up to Five Million Dollars ($5,000,000.00), with the balance of the coverage (at least $195 million in excess of the $5 million self-insured retention) to be obtained through commercial insurance. All insurance policies shall name Railroad as an insured, shall provide liability insurance covering the liabilities assumed by the Commissions under this Agreement, and shall be endorsed to provide that the insurance company will give Railroad thirty (30) days prior written notice

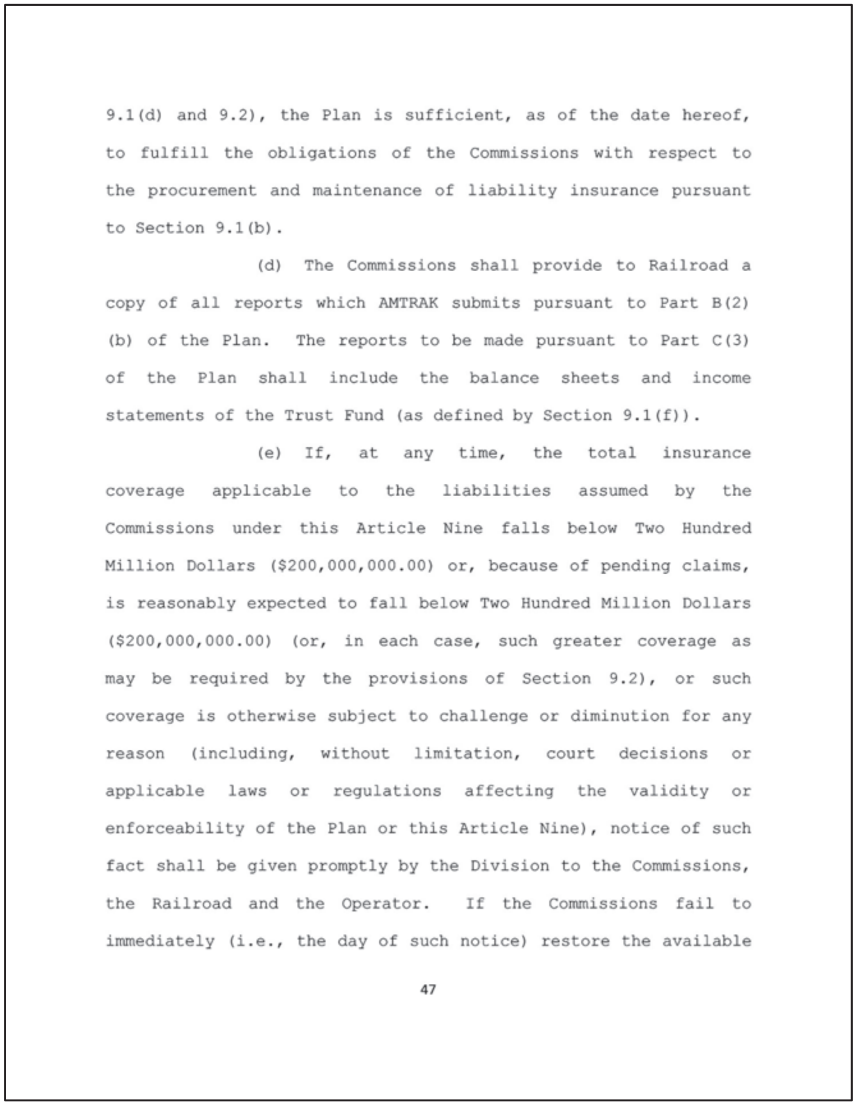
CSXT (continued)



if the policies are to be terminated or modified during the term of this Agreement. The Commissions shall provide Railroad with copies of all commercial insurance policies, including all current endorsements, carried by the Commissions pursuant to this Section 9.1, and a copy of all agreements, including amendments thereto, between the Commissions and the Division of Risk Management of the Commonwealth of Virginia relating to the coverage, structure, administration or funding of the Commissions' insurance program.

(c) In accordance with Section 2.1-526.8:1 of the Code of Virginia, the Division has established the Northern Virginia and Potomac Rappahannock Transportation Commissions Commuter Rail Operations Liability Insurance Plan, a copy of which is annexed as Exhibit D (the "Plan"). The Plan is and shall be maintained by the Commissions and administered by the Division in accordance with Section 15.1-1358 of the Virginia Code and constitutes a "liability policy" for the purposes of that Section and Section 15.1-1364 of the Virginia Code. It is the intention of the parties that the Plan provides coverage for all liability which is or may be imposed upon or assumed by the Commissions under this Article Nine. The parties further agree that, subject to the additional criteria set forth in this Article Nine (including, but not limited to Sections 9.1(b),

CSXT (continued)

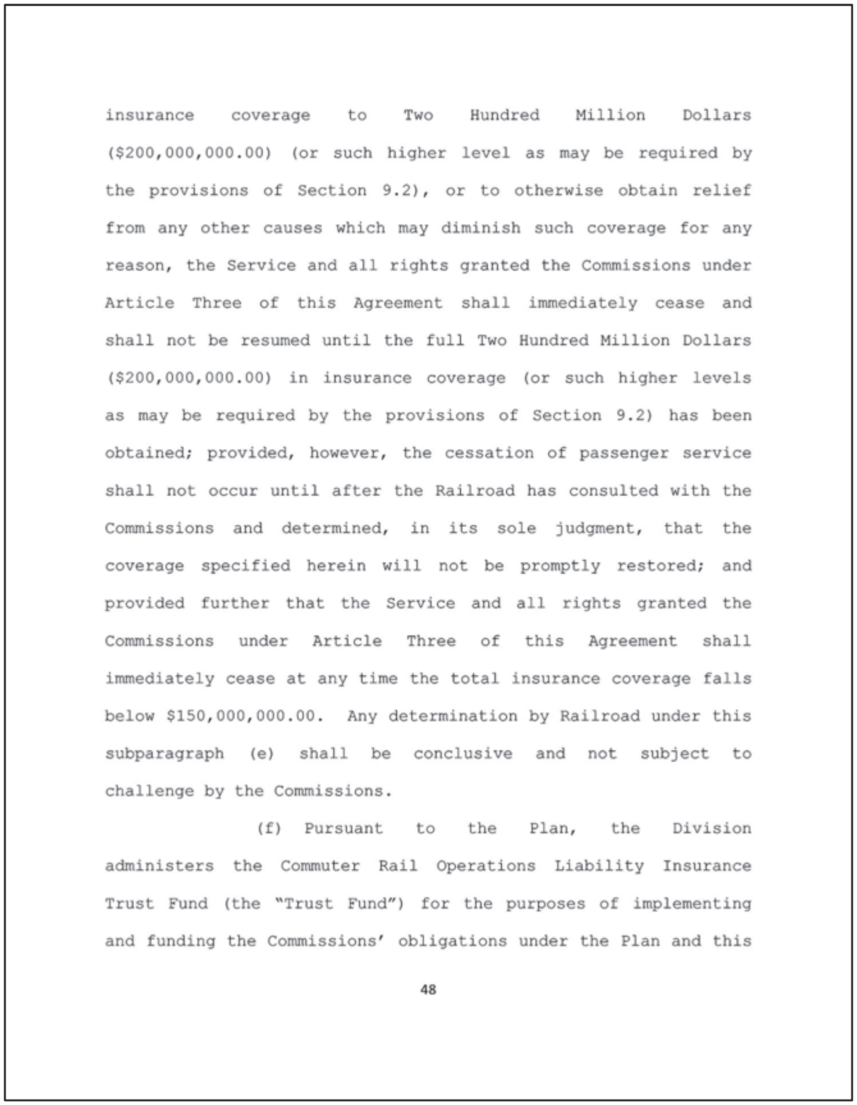


9.1(d) and 9.2), the Plan is sufficient, as of the date hereof, to fulfill the obligations of the Commissions with respect to the procurement and maintenance of liability insurance pursuant to Section 9.1(b).

(d) The Commissions shall provide to Railroad a copy of all reports which AMTRAK submits pursuant to Part B(2)(b) of the Plan. The reports to be made pursuant to Part C(3) of the Plan shall include the balance sheets and income statements of the Trust Fund (as defined by Section 9.1(f)).

(e) If, at any time, the total insurance coverage applicable to the liabilities assumed by the Commissions under this Article Nine falls below Two Hundred Million Dollars ($200,000,000.00) or, because of pending claims, is reasonably expected to fall below Two Hundred Million Dollars ($200,000,000.00) (or, in each case, such greater coverage as may be required by the provisions of Section 9.2), or such coverage is otherwise subject to challenge or diminution for any reason (including, without limitation, court decisions or applicable laws or regulations affecting the validity or enforceability of the Plan or this Article Nine), notice of such fact shall be given promptly by the Division to the Commissions, the Railroad and the Operator. If the Commissions fail to immediately (i.e., the day of such notice) restore the available

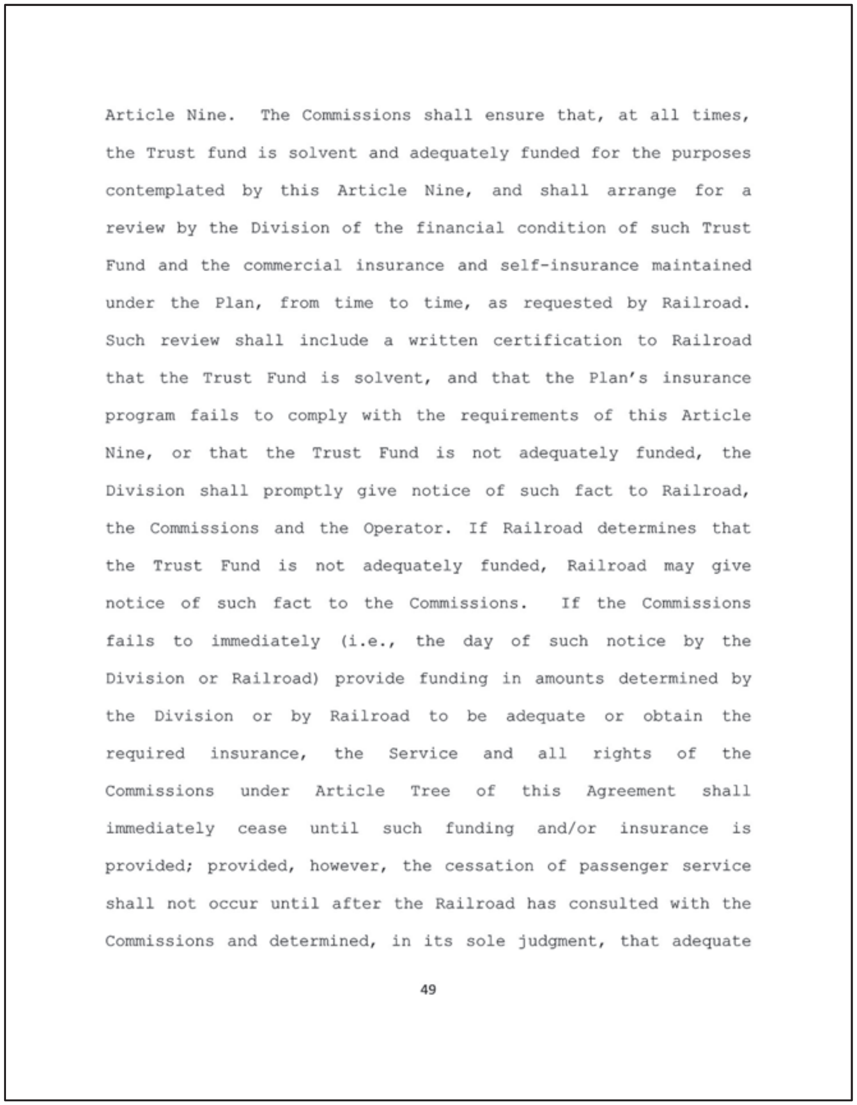
CSXT (continued)



insurance coverage to Two Hundred Million Dollars ($200,000,000.00) (or such higher level as may be required by the provisions of Section 9.2), or to otherwise obtain relief from any other causes which may diminish such coverage for any reason, the Service and all rights granted the Commissions under Article Three of this Agreement shall immediately cease and shall not be resumed until the full Two Hundred Million Dollars ($200,000,000.00) in insurance coverage (or such higher levels as may be required by the provisions of Section 9.2) has been obtained; provided, however, the cessation of passenger service shall not occur until after the Railroad has consulted with the Commissions and determined, in its sole judgment, that the coverage specified herein will not be promptly restored; and provided further that the Service and all rights granted the Commissions under Article Three of this Agreement shall immediately cease at any time the total insurance coverage falls below $150,000,000.00. Any determination by Railroad under this subparagraph (e) shall be conclusive and not subject to challenge by the Commissions.

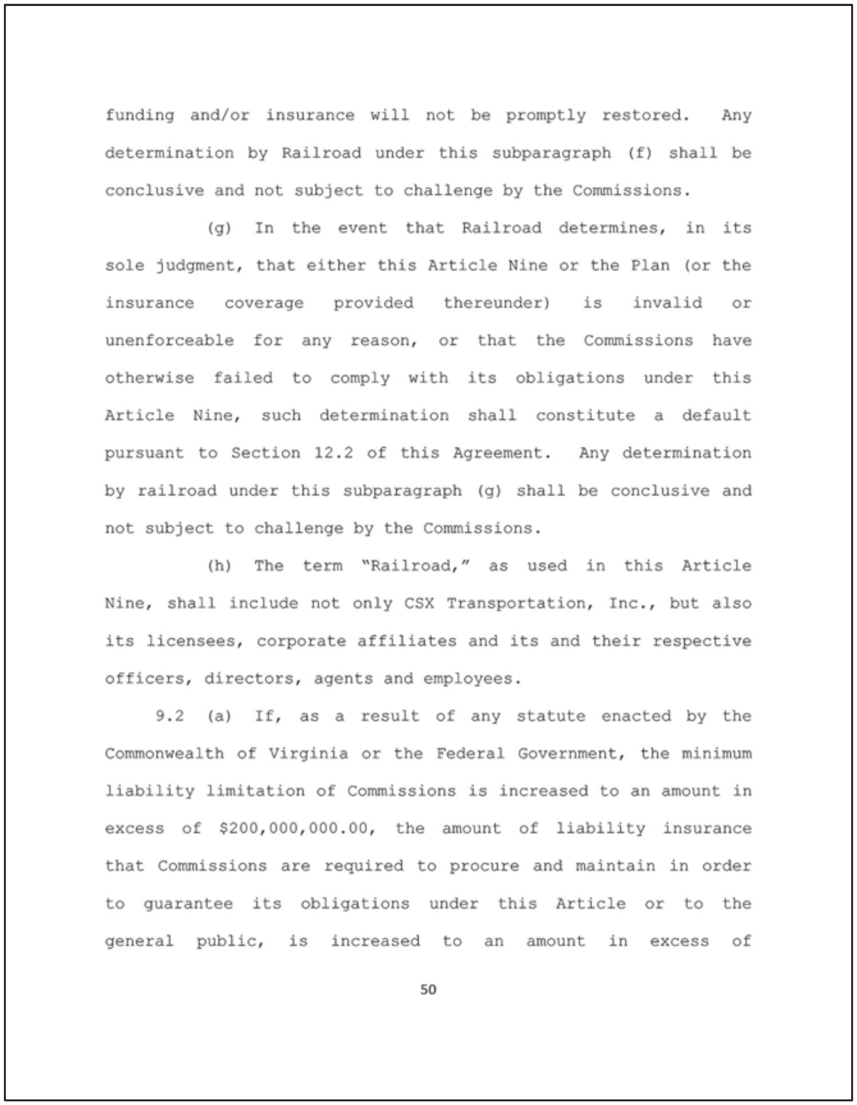
(f) Pursuant to the Plan, the Division administers the Commuter Rail Operations Liability Insurance Trust Fund (the "Trust Fund") for the purposes of implementing and funding the Commissions' obligations under the Plan and this

CSXT (continued)



Article Nine. The Commissions shall ensure that, at all times, the Trust fund is solvent and adequately funded for the purposes contemplated by this Article Nine, and shall arrange for a review by the Division of the financial condition of such Trust Fund and the commercial insurance and self-insurance maintained under the Plan, from time to time, as requested by Railroad. Such review shall include a written certification to Railroad that the Trust Fund is solvent, and that the Plan's insurance program fails to comply with the requirements of this Article Nine, or that the Trust Fund is not adequately funded, the Division shall promptly give notice of such fact to Railroad, the Commissions and the Operator. If Railroad determines that the Trust Fund is not adequately funded, Railroad may give notice of such fact to the Commissions. If the Commissions fails to immediately (i.e., the day of such notice by the Division or Railroad) provide funding in amounts determined by the Division or by Railroad to be adequate or obtain the required insurance, the Service and all rights of the Commissions under Article Tree of this Agreement shall immediately cease until such funding and/or insurance is provided; provided, however, the cessation of passenger service shall not occur until after the Railroad has consulted with the Commissions and determined, in its sole judgment, that adequate

CSXT (continued)



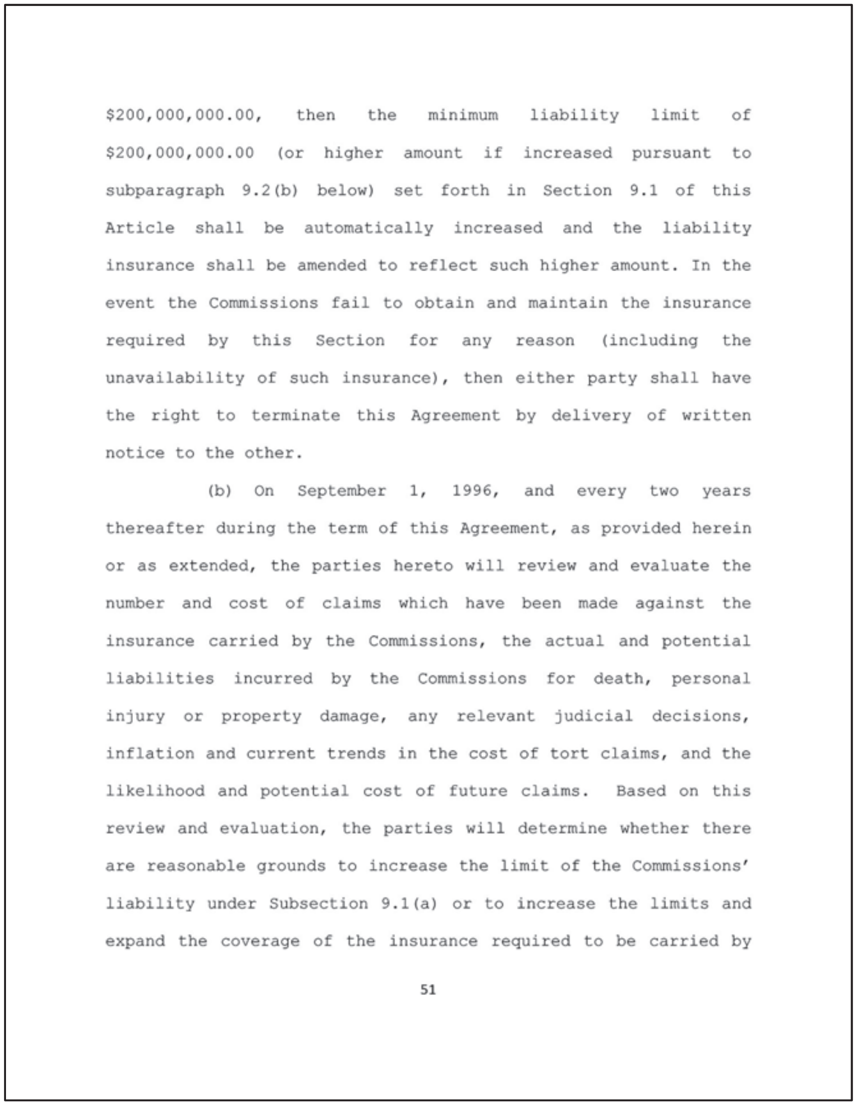
funding and/or insurance will not be promptly restored. Any determination by Railroad under this subparagraph (f) shall be conclusive and not subject to challenge by the Commissions.

(g) In the event that Railroad determines, in its sole judgment, that either this Article Nine or the Plan (or the insurance coverage provided thereunder) is invalid or unenforceable for any reason, or that the Commissions have otherwise failed to comply with its obligations under this Article Nine, such determination shall constitute a default pursuant to Section 12.2 of this Agreement. Any determination by railroad under this subparagraph (g) shall be conclusive and not subject to challenge by the Commissions.

(h) The term "Railroad," as used in this Article Nine, shall include not only CSX Transportation, Inc., but also its licensees, corporate affiliates and its and their respective officers, directors, agents and employees.

9.2 (a) If, as a result of any statute enacted by the Commonwealth of Virginia or the Federal Government, the minimum liability limitation of Commissions is increased to an amount in excess of $200,000,000.00, the amount of liability insurance that Commissions are required to procure and maintain in order to guarantee its obligations under this Article or to the general public, is increased to an amount in excess of

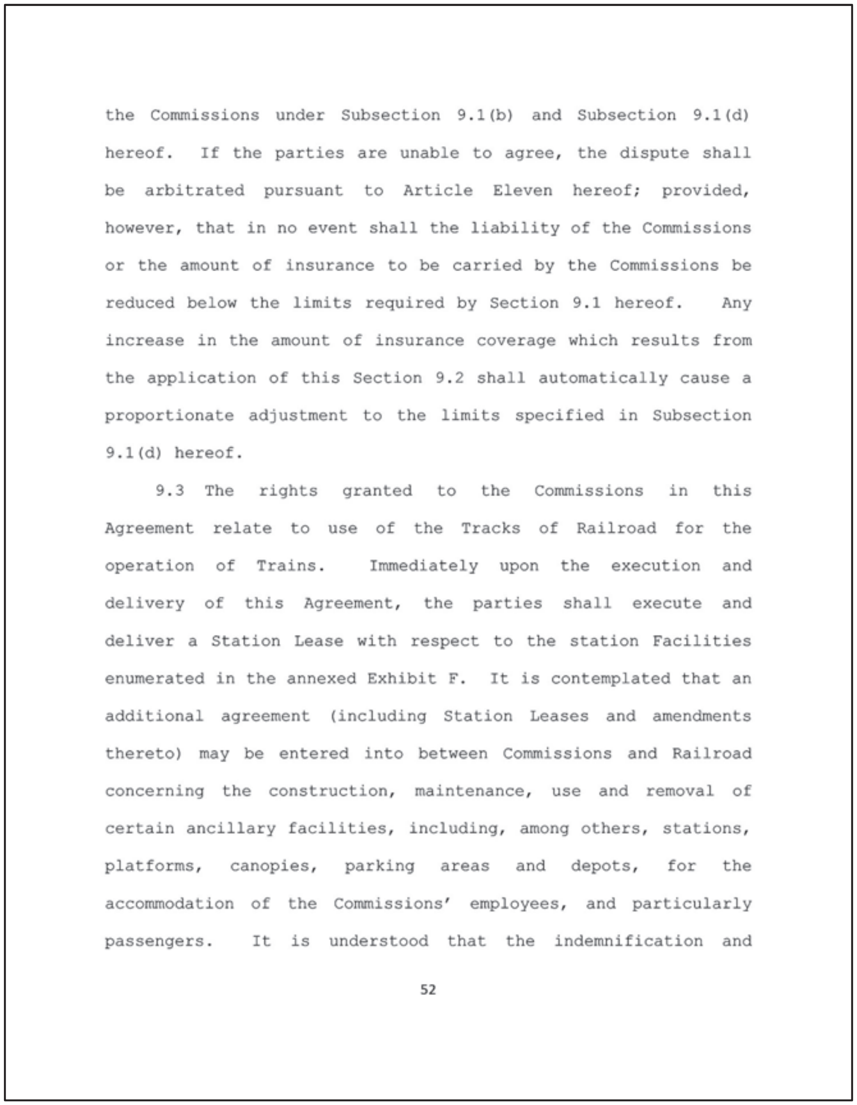
CSXT (continued)



$200,000,000.00, then the minimum liability limit of $200,000,000.00 (or higher amount if increased pursuant to subparagraph 9.2(b) below) set forth in Section 9.1 of this Article shall be automatically increased and the liability insurance shall be amended to reflect such higher amount. In the event the Commissions fail to obtain and maintain the insurance required by this Section for any reason (including the unavailability of such insurance), then either party shall have the right to terminate this Agreement by delivery of written notice to the other.

(b) On September 1, 1996, and every two years thereafter during the term of this Agreement, as provided herein or as extended, the parties hereto will review and evaluate the number and cost of claims which have been made against the insurance carried by the Commissions, the actual and potential liabilities incurred by the Commissions for death, personal injury or property damage, any relevant judicial decisions, inflation and current trends in the cost of tort claims, and the likelihood and potential cost of future claims. Based on this review and evaluation, the parties will determine whether there are reasonable grounds to increase the limit of the Commissions' liability under Subsection 9.1(a) or to increase the limits and expand the coverage of the insurance required to be carried by

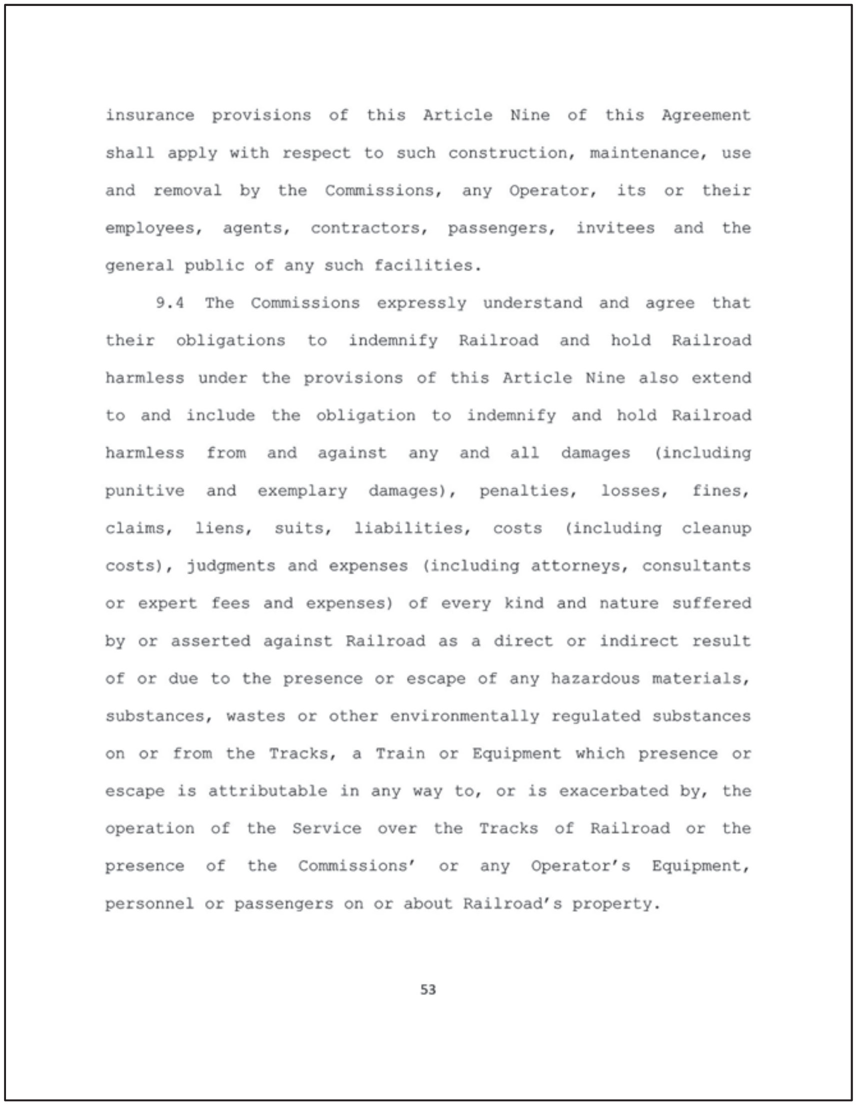
CSXT (continued)



the Commissions under Subsection 9.1(b) and Subsection 9.1(d) hereof. If the parties are unable to agree, the dispute shall be arbitrated pursuant to Article Eleven hereof; provided, however, that in no event shall the liability of the Commissions or the amount of insurance to be carried by the Commissions be reduced below the limits required by Section 9.1 hereof. Any increase in the amount of insurance coverage which results from the application of this Section 9.2 shall automatically cause a proportionate adjustment to the limits specified in Subsection 9.1(d) hereof.

9.3 The rights granted to the Commissions in this Agreement relate to use of the Tracks of Railroad for the operation of Trains. Immediately upon the execution and delivery of this Agreement, the parties shall execute and deliver a Station Lease with respect to the station Facilities enumerated in the annexed Exhibit F. It is contemplated that an additional agreement (including Station Leases and amendments thereto) may be entered into between Commissions and Railroad concerning the construction, maintenance, use and removal of certain ancillary facilities, including, among others, stations, platforms, canopies, parking areas and depots, for the accommodation of the Commissions' employees, and particularly passengers. It is understood that the indemnification and

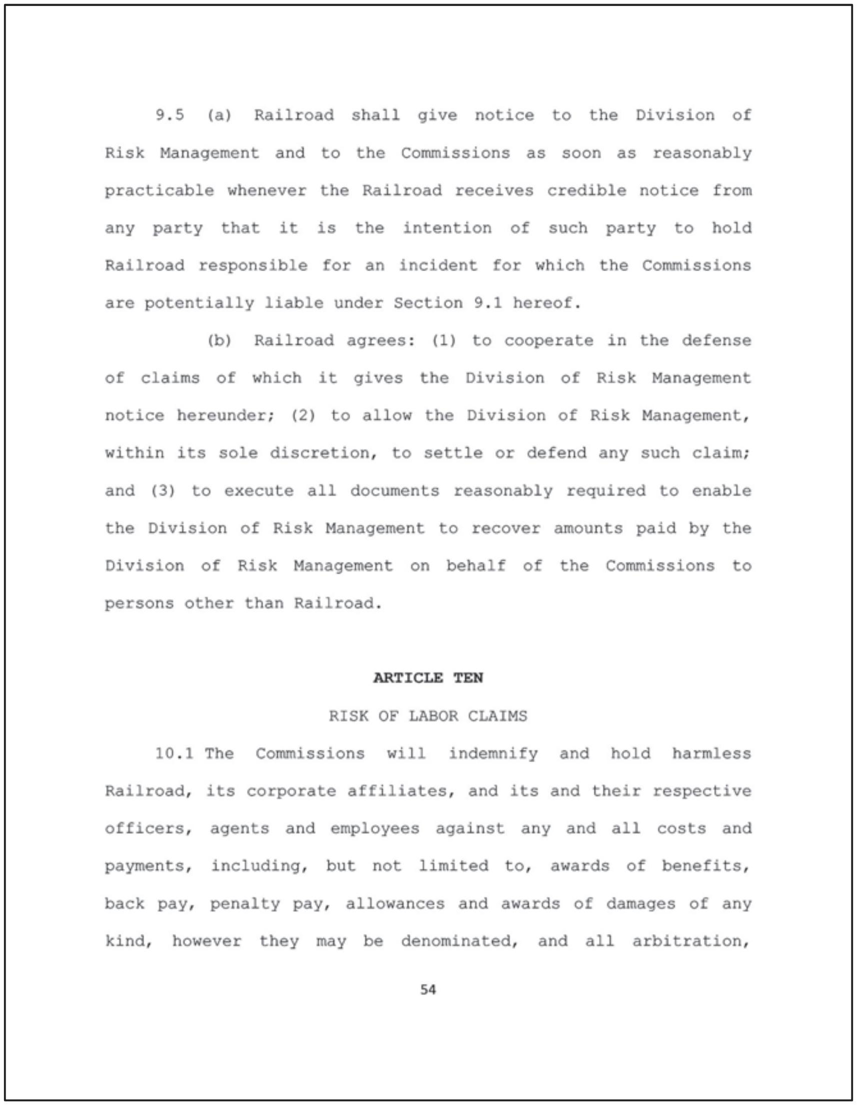
CSXT (continued)



insurance provisions of this Article Nine of this Agreement shall apply with respect to such construction, maintenance, use and removal by the Commissions, any Operator, its or their employees, agents, contractors, passengers, invitees and the general public of any such facilities.

9.4 The Commissions expressly understand and agree that their obligations to indemnify Railroad and hold Railroad harmless under the provisions of this Article Nine also extend to and include the obligation to indemnify and hold Railroad harmless from and against any and all damages (including punitive and exemplary damages), penalties, losses, fines, claims, liens, suits, liabilities, costs (including cleanup costs), judgments and expenses (including attorneys, consultants or expert fees and expenses) of every kind and nature suffered by or asserted against Railroad as a direct or indirect result of or due to the presence or escape of any hazardous materials, substances, wastes or other environmentally regulated substances on or from the Tracks, a Train or Equipment which presence or escape is attributable in any way to, or is exacerbated by, the operation of the Service over the Tracks of Railroad or the presence of the Commissions' or any Operator's Equipment, personnel or passengers on or about Railroad's property.

CSXT (continued)



9.5 (a) Railroad shall give notice to the Division of Risk Management and to the Commissions as soon as reasonably practicable whenever the Railroad receives credible notice from any party that it is the intention of such party to hold Railroad responsible for an incident for which the Commissions are potentially liable under Section 9.1 hereof.

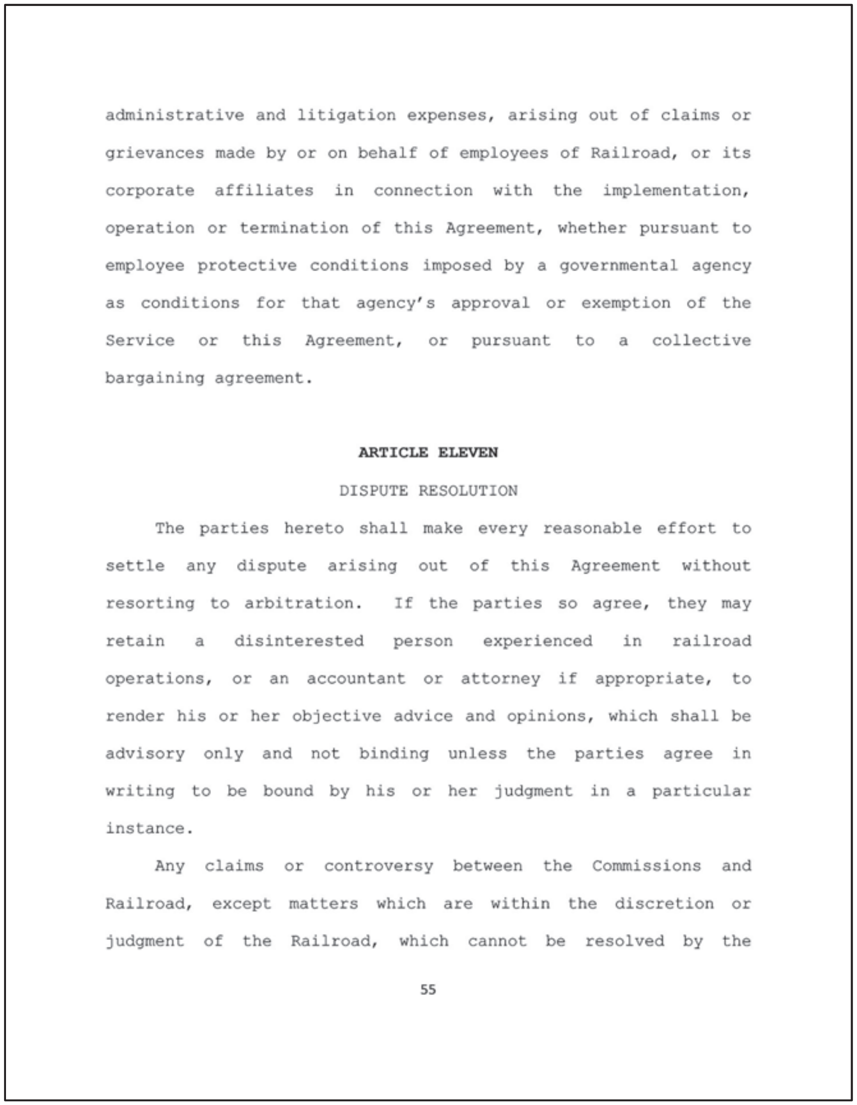
(b) Railroad agrees: (1) to cooperate in the defense of claims of which it gives the Division of Risk Management notice hereunder; (2) to allow the Division of Risk Management, within its sole discretion, to settle or defend any such claim; and (3) to execute all documents reasonably required to enable the Division of Risk Management to recover amounts paid by the Division of Risk Management on behalf of the Commissions to persons other than Railroad.

ARTICLE TEN

RISK OF LABOR CLAIMS

10.1 The Commissions will indemnify and hold harmless Railroad, its corporate affiliates, and its and their respective officers, agents and employees against any and all costs and payments, including, but not limited to, awards of benefits, back pay, penalty pay, allowances and awards of damages of any kind, however they may be denominated, and all arbitration,

CSXT (continued)



administrative and litigation expenses, arising out of claims or grievances made by or on behalf of employees of Railroad, or its corporate affiliates in connection with the implementation, operation or termination of this Agreement, whether pursuant to employee protective conditions imposed by a governmental agency as conditions for that agency's approval or exemption of the Service or this Agreement, or pursuant to a collective bargaining agreement.

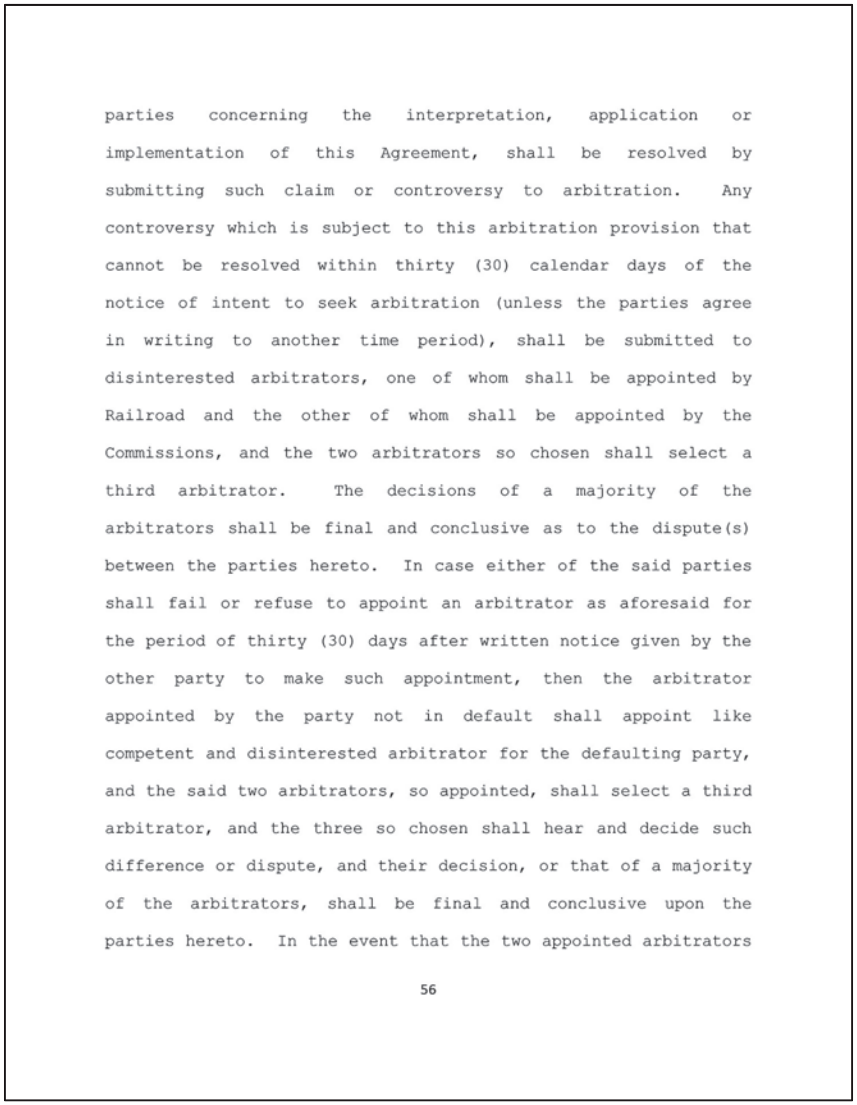
ARTICLE ELEVEN

DISPUTE RESOLUTION

The parties hereto shall make every reasonable effort to settle any dispute arising out of this Agreement without resorting to arbitration. If the parties so agree, they may retain a disinterested person experienced in railroad operations, or an accountant or attorney if appropriate, to render his or her objective advice and opinions, which shall be advisory only and not binding unless the parties agree in writing to be bound by his or her judgment in a particular instance.

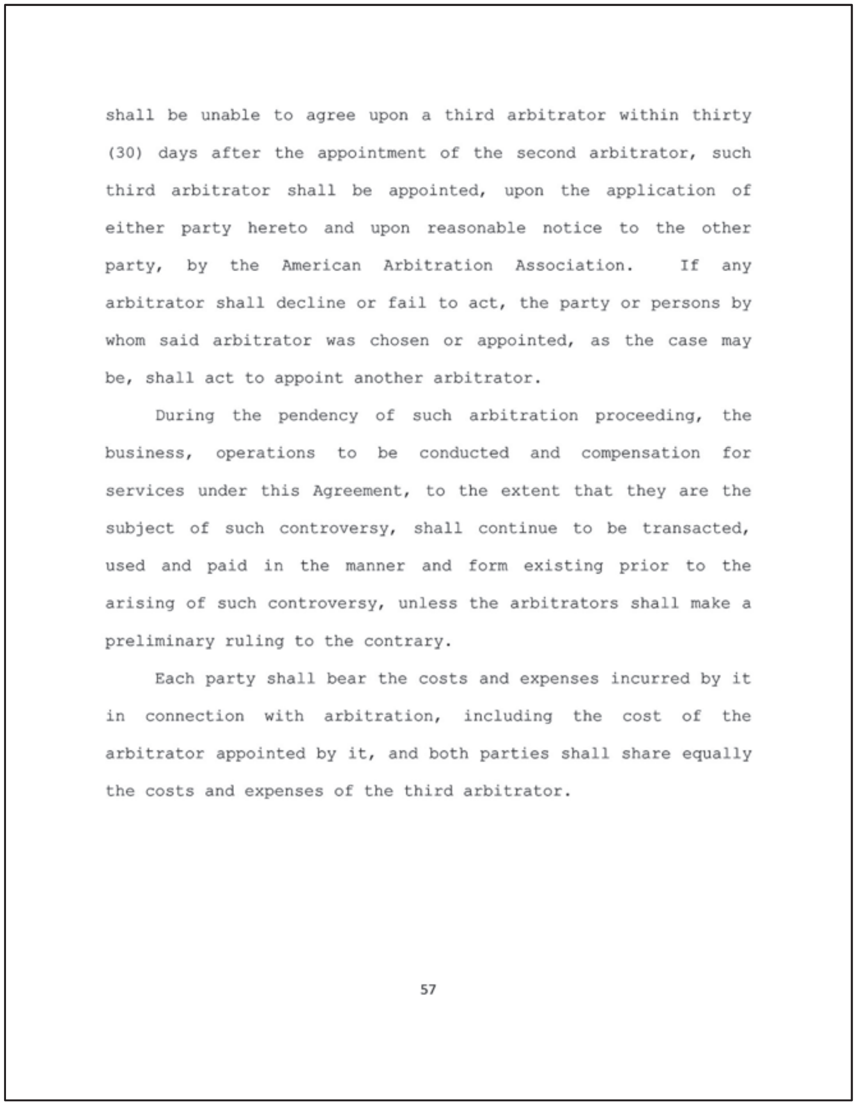
Any claims or controversy between the Commissions and Railroad, except matters which are within the discretion or judgment of the Railroad, which cannot be resolved by the

CSXT (continued)



parties concerning the interpretation, application or implementation of this Agreement, shall be resolved by submitting such claim or controversy to arbitration. Any controversy which is subject to this arbitration provision that cannot be resolved within thirty (30) calendar days of the notice of intent to seek arbitration (unless the parties agree in writing to another time period), shall be submitted to disinterested arbitrators, one of whom shall be appointed by Railroad and the other of whom shall be appointed by the Commissions, and the two arbitrators so chosen shall select a third arbitrator. The decisions of a majority of the arbitrators shall be final and conclusive as to the dispute(s) between the parties hereto. In case either of the said parties shall fail or refuse to appoint an arbitrator as aforesaid for the period of thirty (30) days after written notice given by the other party to make such appointment, then the arbitrator appointed by the party not in default shall appoint like competent and disinterested arbitrator for the defaulting party, and the said two arbitrators, so appointed, shall select a third arbitrator, and the three so chosen shall hear and decide such difference or dispute, and their decision, or that of a majority of the arbitrators, shall be final and conclusive upon the parties hereto. In the event that the two appointed arbitrators

CSXT (continued)

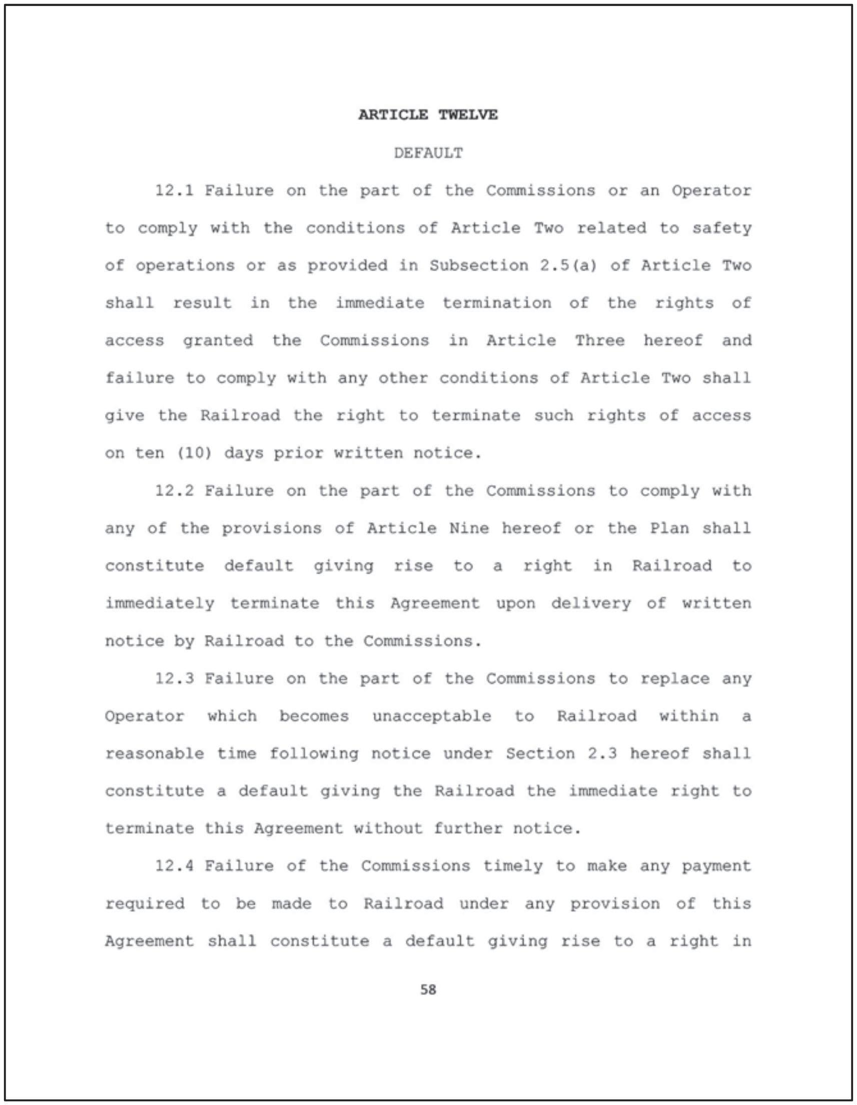


shall be unable to agree upon a third arbitrator within thirty (30) days after the appointment of the second arbitrator, such third arbitrator shall be appointed, upon the application of either party hereto and upon reasonable notice to the other party, by the American Arbitration Association. If any arbitrator shall decline or fail to act, the party or persons by whom said arbitrator was chosen or appointed, as the case may be, shall act to appoint another arbitrator.

During the pendency of such arbitration proceeding, the business, operations to be conducted and compensation for services under this Agreement, to the extent that they are the subject of such controversy, shall continue to be transacted, used and paid in the manner and form existing prior to the arising of such controversy, unless the arbitrators shall make a preliminary ruling to the contrary.

Each party shall bear the costs and expenses incurred by it in connection with arbitration, including the cost of the arbitrator appointed by it, and both parties shall share equally the costs and expenses of the third arbitrator.

CSXT (continued)



ARTICLE TWELVE

DEFAULT

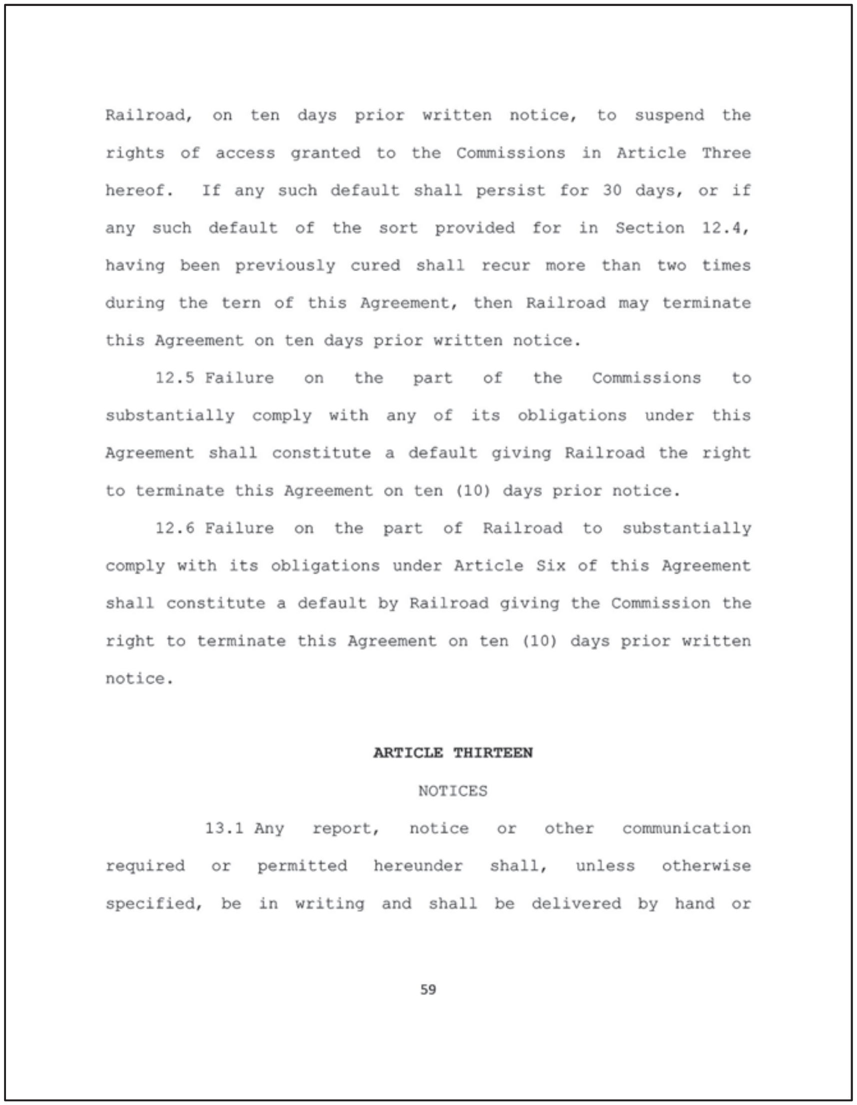
12.1 Failure on the part of the Commissions or an Operator to comply with the conditions of Article Two related to safety of operations or as provided in Subsection 2.5(a) of Article Two shall result in the immediate termination of the rights of access granted the Commissions in Article Three hereof and failure to comply with any other conditions of Article Two shall give the Railroad the right to terminate such rights of access on ten (10) days prior written notice.

12.2 Failure on the part of the Commissions to comply with any of the provisions of Article Nine hereof or the Plan shall constitute default giving rise to a right in Railroad to immediately terminate this Agreement upon delivery of written notice by Railroad to the Commissions.

12.3 Failure on the part of the Commissions to replace any Operator which becomes unacceptable to Railroad within a reasonable time following notice under Section 2.3 hereof shall constitute a default giving the Railroad the immediate right to terminate this Agreement without further notice.

12.4 Failure of the Commissions timely to make any payment required to be made to Railroad under any provision of this Agreement shall constitute a default giving rise to a right in

CSXT (continued)



Railroad, on ten days prior written notice, to suspend the rights of access granted to the Commissions in Article Three hereof. If any such default shall persist for 30 days, or if any such default of the sort provided for in Section 12.4, having been previously cured shall recur more than two times during the tern of this Agreement, then Railroad may terminate this Agreement on ten days prior written notice.

12.5 Failure on the part of the Commissions to substantially comply with any of its obligations under this Agreement shall constitute a default giving Railroad the right to terminate this Agreement on ten (10) days prior notice.

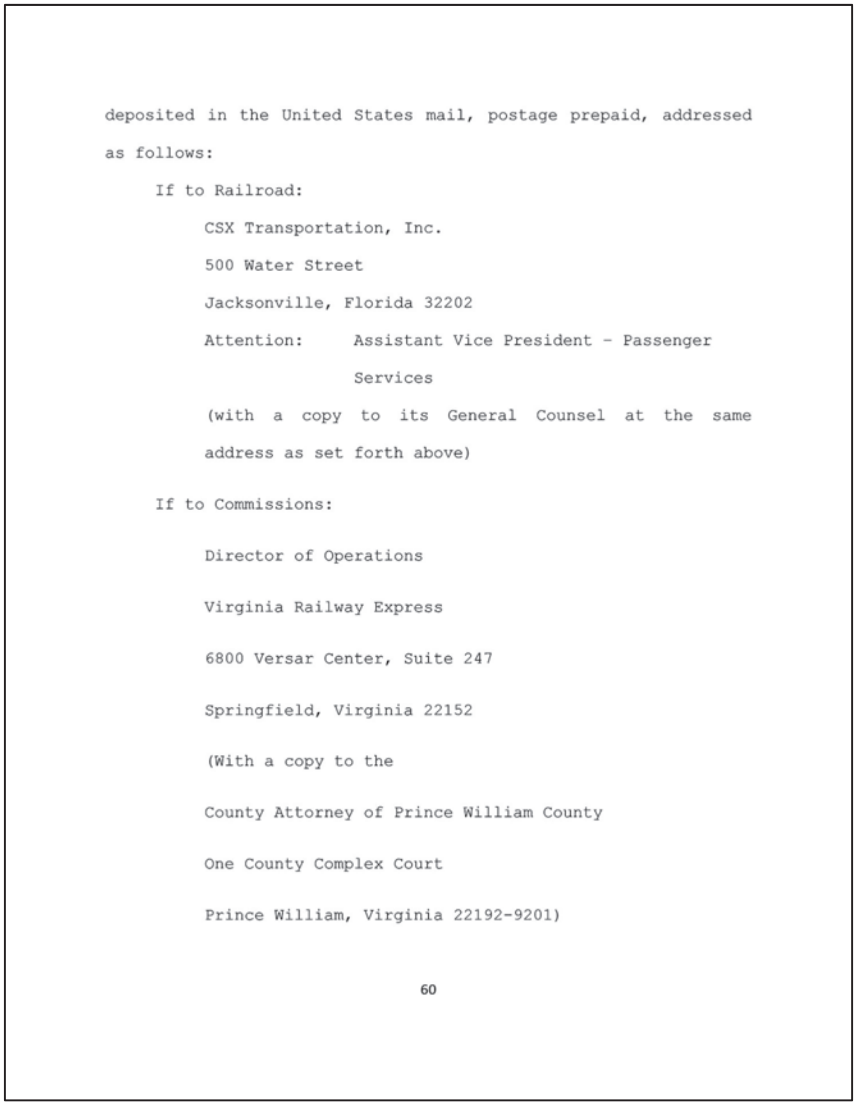
12.6 Failure on the part of Railroad to substantially comply with its obligations under Article Six of this Agreement shall constitute a default by Railroad giving the Commission the right to terminate this Agreement on ten (10) days prior written notice.

ARTICLE THIRTEEN

NOTICES

13.1 Any report, notice or other communication required or permitted hereunder shall, unless otherwise specified, be in writing and shall be delivered by hand or

CSXT (continued)



deposited in the United States mail, postage prepaid, addressed as follows:

If to Railroad:

CSX Transportation, Inc.
500 Water Street
Jacksonville, Florida 32202
Attention: Assistant Vice President – Passenger Services
(with a copy to its General Counsel at the same address as set forth above)

If to Commissions:

Director of Operations

Virginia Railway Express

6800 Versar Center, Suite 247

Springfield, Virginia 22152

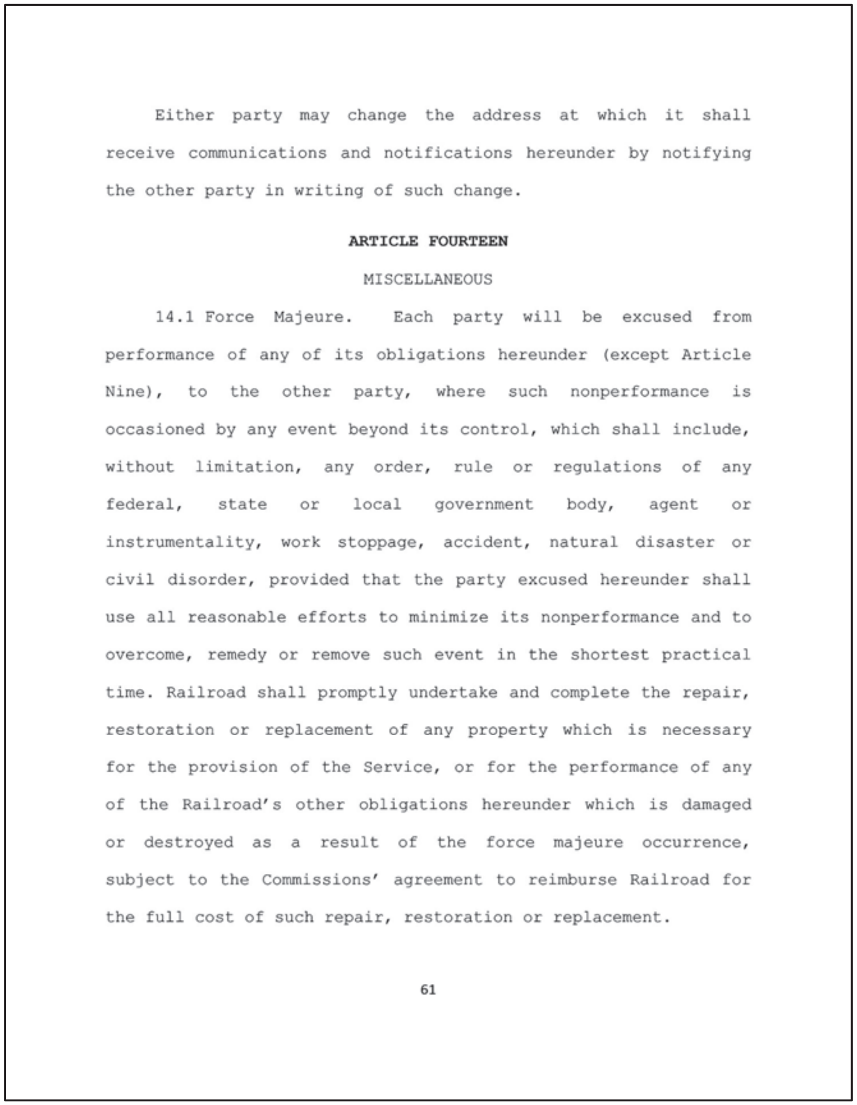
(With a copy to the

County Attorney of Prince William County

One County Complex Court

Prince William, Virginia 22192-9201)

CSXT (continued)



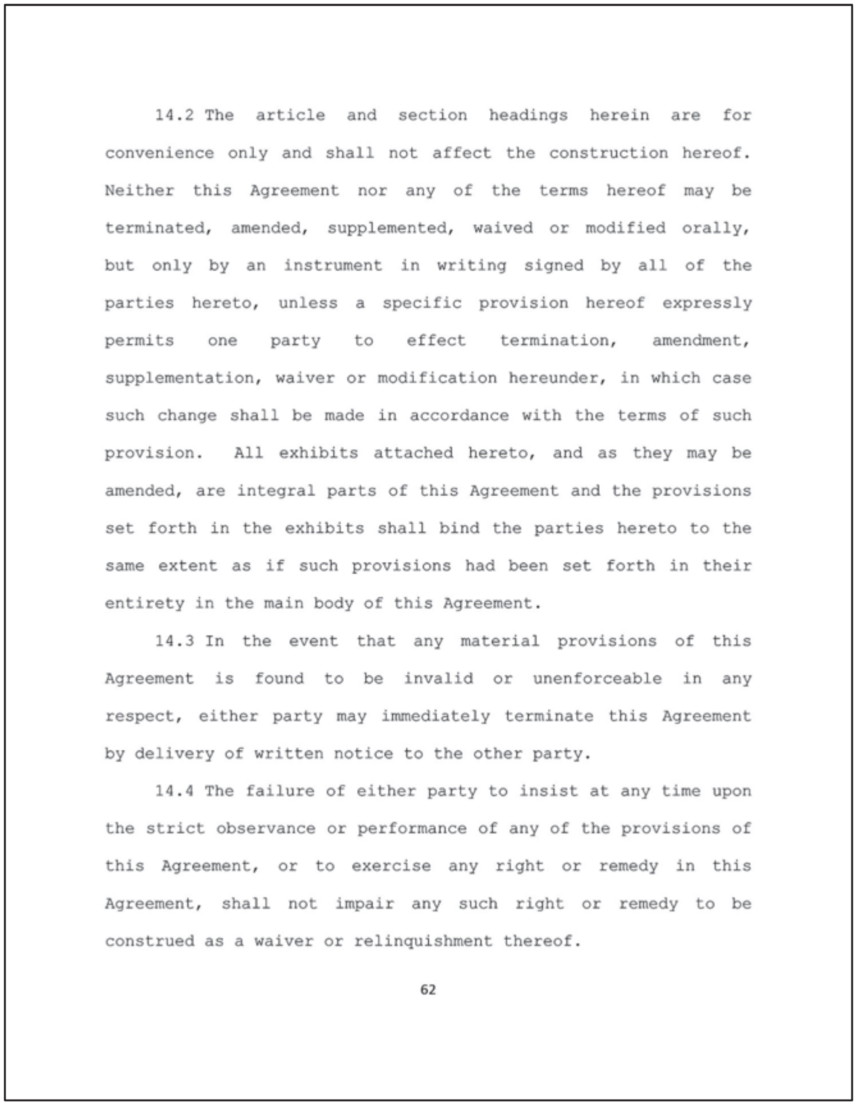
Either party may change the address at which it shall receive communications and notifications hereunder by notifying the other party in writing of such change.

ARTICLE FOURTEEN

MISCELLANEOUS

14.1 Force Majeure. Each party will be excused from performance of any of its obligations hereunder (except Article Nine), to the other party, where such nonperformance is occasioned by any event beyond its control, which shall include, without limitation, any order, rule or regulations of any federal, state or local government body, agent or instrumentality, work stoppage, accident, natural disaster or civil disorder, provided that the party excused hereunder shall use all reasonable efforts to minimize its nonperformance and to overcome, remedy or remove such event in the shortest practical time. Railroad shall promptly undertake and complete the repair, restoration or replacement of any property which is necessary for the provision of the Service, or for the performance of any of the Railroad's other obligations hereunder which is damaged or destroyed as a result of the force majeure occurrence, subject to the Commissions' agreement to reimburse Railroad for the full cost of such repair, restoration or replacement.

CSXT (continued)

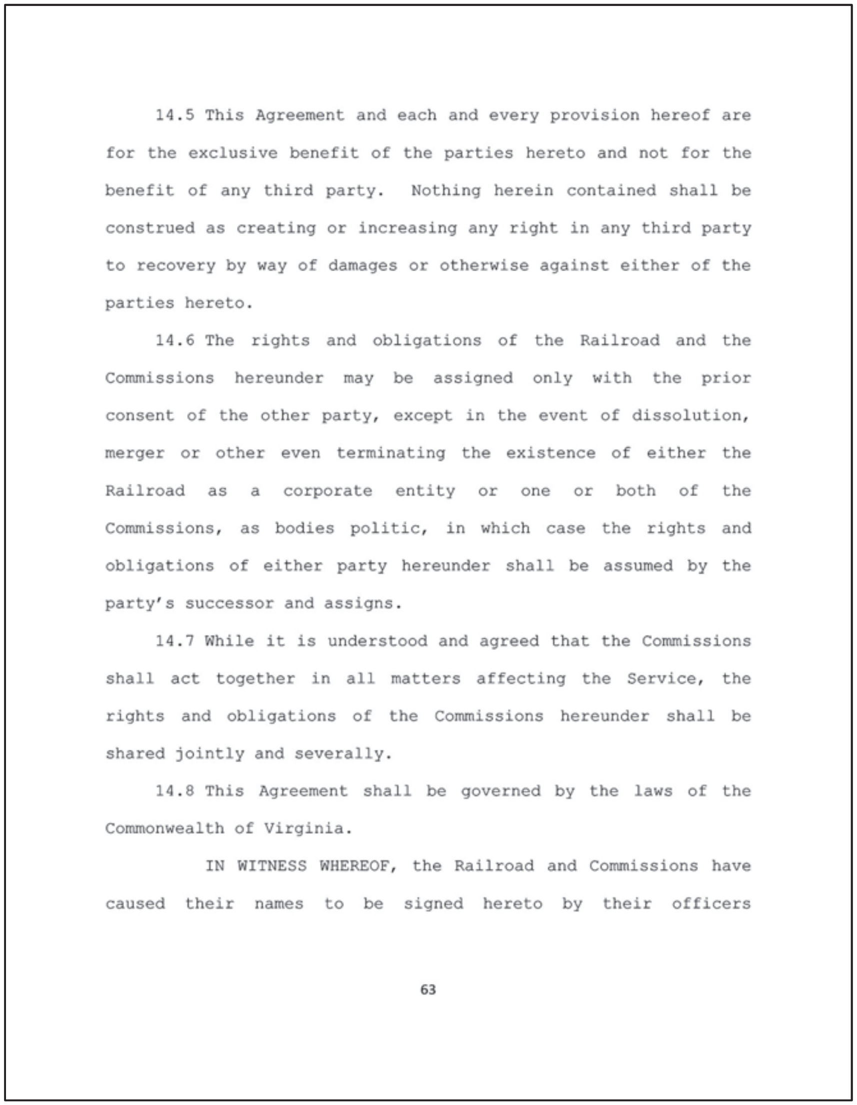


14.2 The article and section headings herein are for convenience only and shall not affect the construction hereof. Neither this Agreement nor any of the terms hereof may be terminated, amended, supplemented, waived or modified orally, but only by an instrument in writing signed by all of the parties hereto, unless a specific provision hereof expressly permits one party to effect termination, amendment, supplementation, waiver or modification hereunder, in which case such change shall be made in accordance with the terms of such provision. All exhibits attached hereto, and as they may be amended, are integral parts of this Agreement and the provisions set forth in the exhibits shall bind the parties hereto to the same extent as if such provisions had been set forth in their entirety in the main body of this Agreement.

14.3 In the event that any material provisions of this Agreement is found to be invalid or unenforceable in any respect, either party may immediately terminate this Agreement by delivery of written notice to the other party.

14.4 The failure of either party to insist at any time upon the strict observance or performance of any of the provisions of this Agreement, or to exercise any right or remedy in this Agreement, shall not impair any such right or remedy to be construed as a waiver or relinquishment thereof.

CSXT (continued)



14.5 This Agreement and each and every provision hereof are for the exclusive benefit of the parties hereto and not for the benefit of any third party. Nothing herein contained shall be construed as creating or increasing any right in any third party to recovery by way of damages or otherwise against either of the parties hereto.

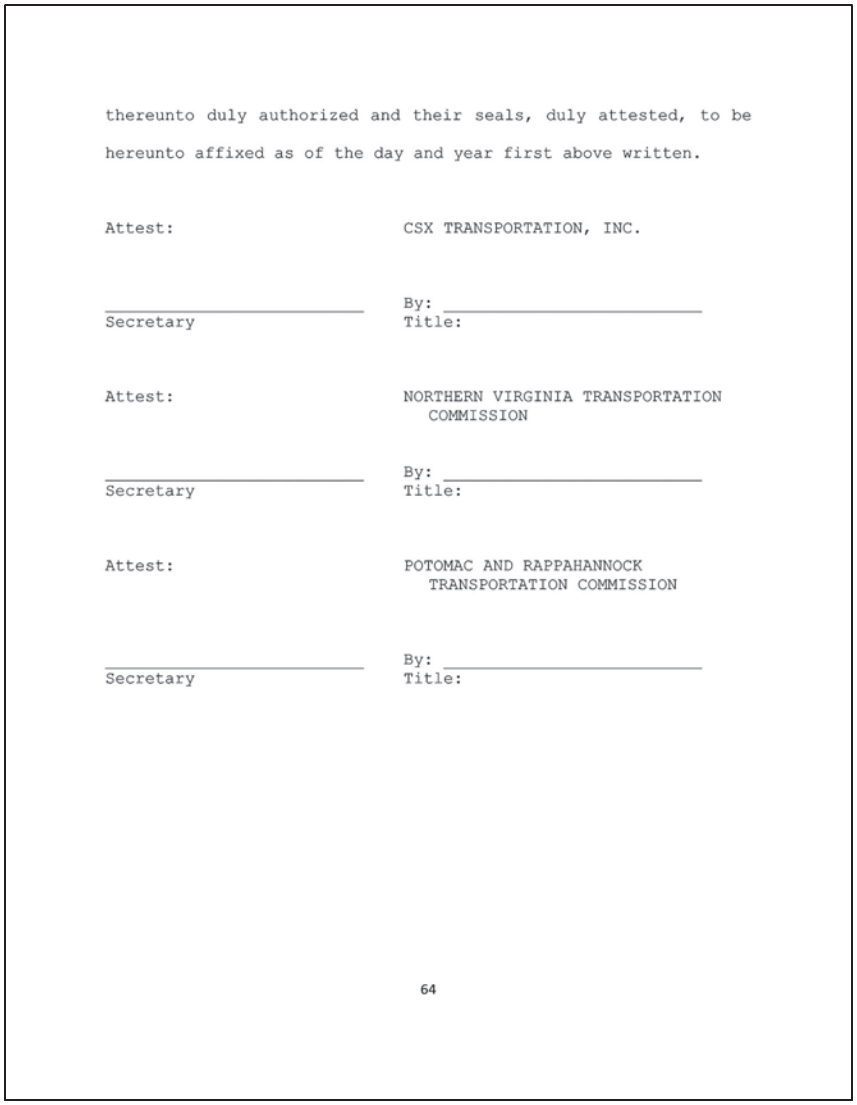
14.6 The rights and obligations of the Railroad and the Commissions hereunder may be assigned only with the prior consent of the other party, except in the event of dissolution, merger or other even terminating the existence of either the Railroad as a corporate entity or one or both of the Commissions, as bodies politic, in which case the rights and obligations of either party hereunder shall be assumed by the party's successor and assigns.

14.7 While it is understood and agreed that the Commissions shall act together in all matters affecting the Service, the rights and obligations of the Commissions hereunder shall be shared jointly and severally.

14.8 This Agreement shall be governed by the laws of the Commonwealth of Virginia.

IN WITNESS WHEREOF, the Railroad and Commissions have caused their names to be signed hereto by their officers

CSXT (continued)



thereunto duly authorized and their seals, duly attested, to be hereunto affixed as of the day and year first above written.

CSXT (continued)

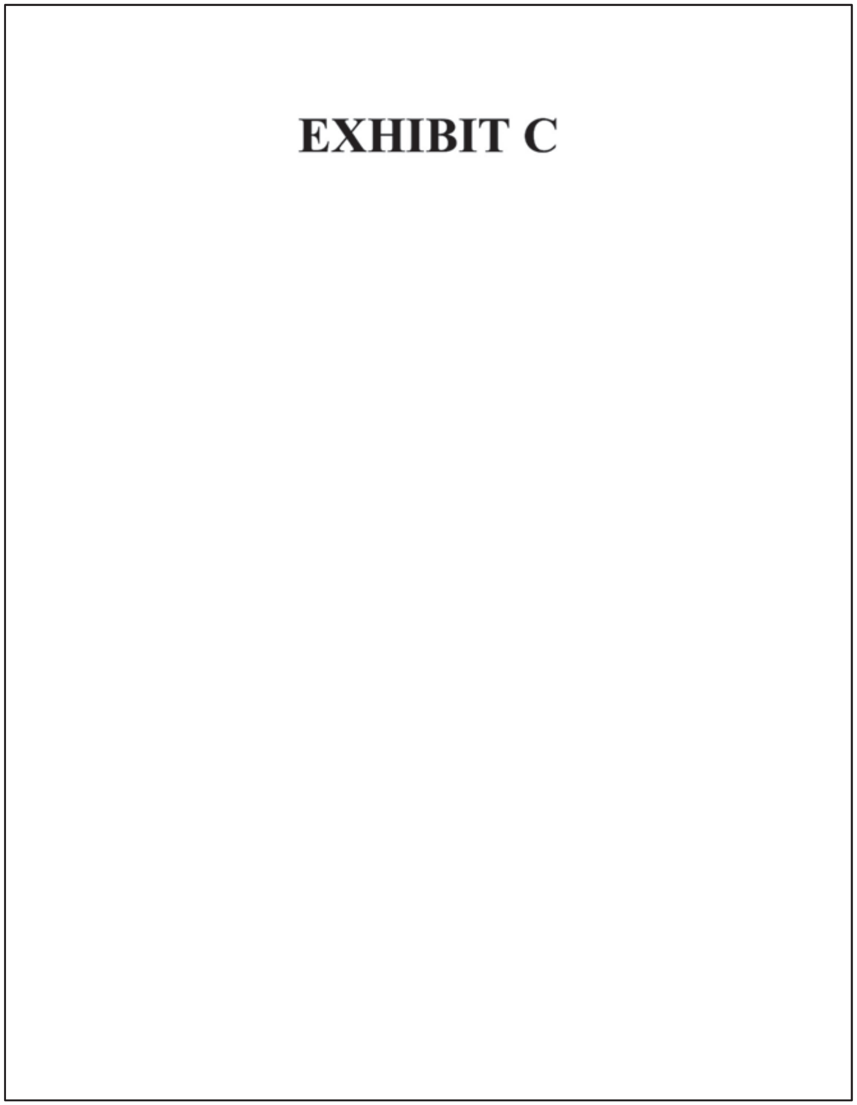

EXHIBIT C

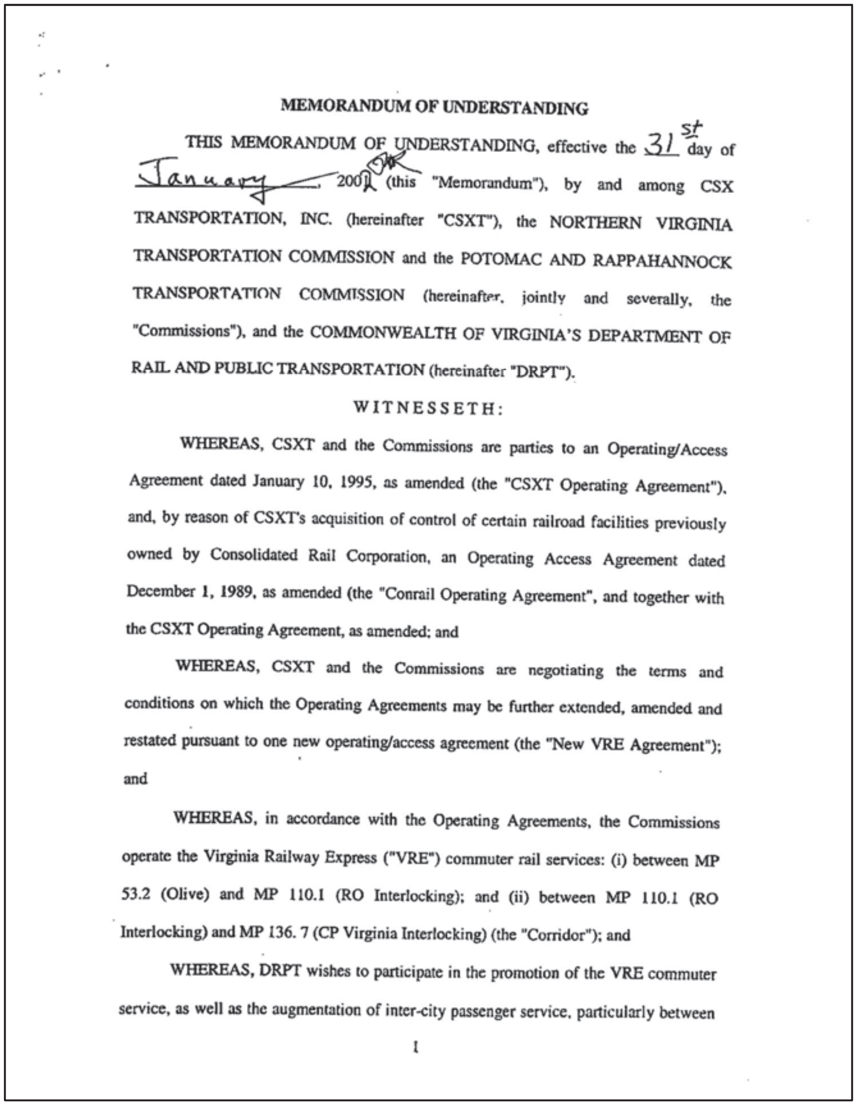
CSXT (continued)



MEMORANDUM OF UNDERSTANDING

THIS MEMORANDUM OF UNDERSTANDING, effective the 31st day of January, 2002 (this "Memorandum"), by and among CSX TRANSPORTATION, INC. (hereinafter "CSXT"), the NORTHERN VIRGINIA TRANSPORTATION COMMISSION and the POTOMAC AND RAPPAHANNOCK TRANSPORTATION COMMISSION (hereinafter, jointly and severally, the "Commissions"), and the COMMONWEALTH OF VIRGINIA'S DEPARTMENT OF RAIL AND PUBLIC TRANSPORTATION (hereinafter "DRPT").

WITNESSETH:

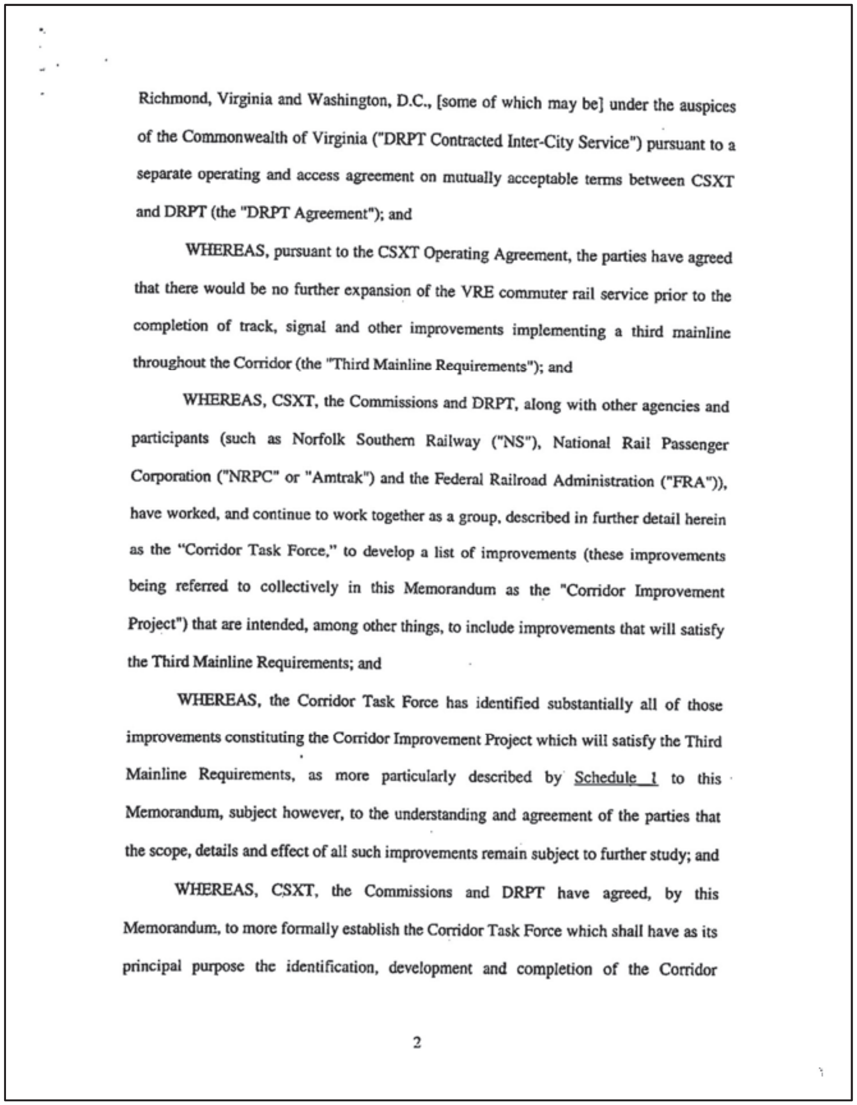
WHEREAS, CSXT and the Commissions are parties to an Operating/Access Agreement dated January 10, 1995, as amended (the "CSXT Operating Agreement"), and, by reason of CSXT's acquisition of control of certain railroad facilities previously owned by Consolidated Rail Corporation, an Operating Access Agreement dated December 1, 1989, as amended (the "Conrail Operating Agreement", and together with the CSXT Operating Agreement, as amended; and

WHEREAS, CSXT and the Commissions are negotiating the terms and conditions on which the Operating Agreements may be further extended, amended and restated pursuant to one new operating/access agreement (the "New VRE Agreement"); and

WHEREAS, in accordance with the Operating Agreements, the Commissions operate the Virginia Railway Express ("VRE") commuter rail services: (i) between MP 53.2 (Olive) and MP 110.1 (RO Interlocking); and (ii) between MP 110.1 (RO Interlocking) and MP 136. 7 (CP Virginia Interlocking) (the "Corridor"); and

WHEREAS, DRPT wishes to participate in the promotion of the VRE commuter service, as well as the augmentation of inter-city passenger service, particularly between

CSXT (continued)



Richmond, Virginia and Washington, D.C., [some of which may be] under the auspices of the Commonwealth of Virginia ("DRPT Contracted Inter-City Service") pursuant to a separate operating and access agreement on mutually acceptable terms between CSXT and DRPT (the "DRPT Agreement"); and

WHEREAS, pursuant to the CSXT Operating Agreement, the parties have agreed that there would be no further expansion of the VRE commuter rail service prior to the completion of track, signal and other improvements implementing a third mainline throughout the Corridor (the "Third Mainline Requirements"); and

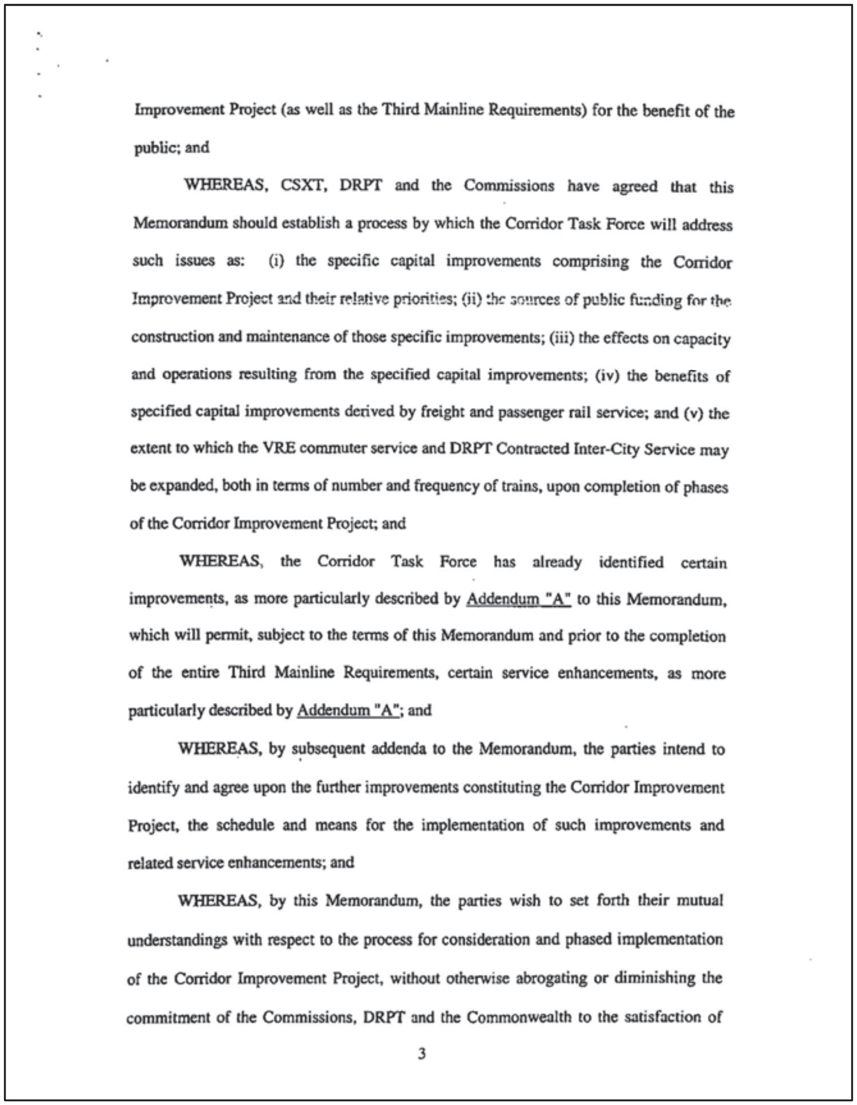
WHEREAS, CSXT, the Commissions and DRPT, along with other agencies and participants (such as Norfolk Southern Railway ("NS"), National Rail Passenger Corporation ("NRPC" or "Amtrak") and the Federal Railroad Administration ("FRA")), have worked, and continue to work together as a group, described in further detail herein as the "Corridor Task Force," to develop a list of improvements (these improvements being referred to collectively in this Memorandum as the "Corridor Improvement Project") that are intended, among other things, to include improvements that will satisfy the Third Mainline Requirements; and

WHEREAS, the Corridor Task Force has identified substantially all of those improvements constituting the Corridor Improvement Project which will satisfy the Third Mainline Requirements, as more particularly described by Schedule 1 to this Memorandum, subject however, to the understanding and agreement of the parties that the scope, details and effect of all such improvements remain subject to further study; and

WHEREAS, CSXT, the Commissions and DRPT have agreed, by this Memorandum, to more formally establish the Corridor Task Force which shall have as its principal purpose the identification, development and completion of the Corridor

2

CSXT (continued)



Improvement Project (as well as the Third Mainline Requirements) for the benefit of the public; and

WHEREAS, CSXT, DRPT and the Commissions have agreed that this Memorandum should establish a process by which the Corridor Task Force will address such issues as: (i) the specific capital improvements comprising the Corridor Improvement Project and their relative priorities; (ii) the sources of public funding for the construction and maintenance of those specific improvements; (iii) the effects on capacity and operations resulting from the specified capital improvements; (iv) the benefits of specified capital improvements derived by freight and passenger rail service; and (v) the extent to which the VRE commuter service and DRPT Contracted Inter-City Service may be expanded, both in terms of number and frequency of trains, upon completion of phases of the Corridor Improvement Project; and

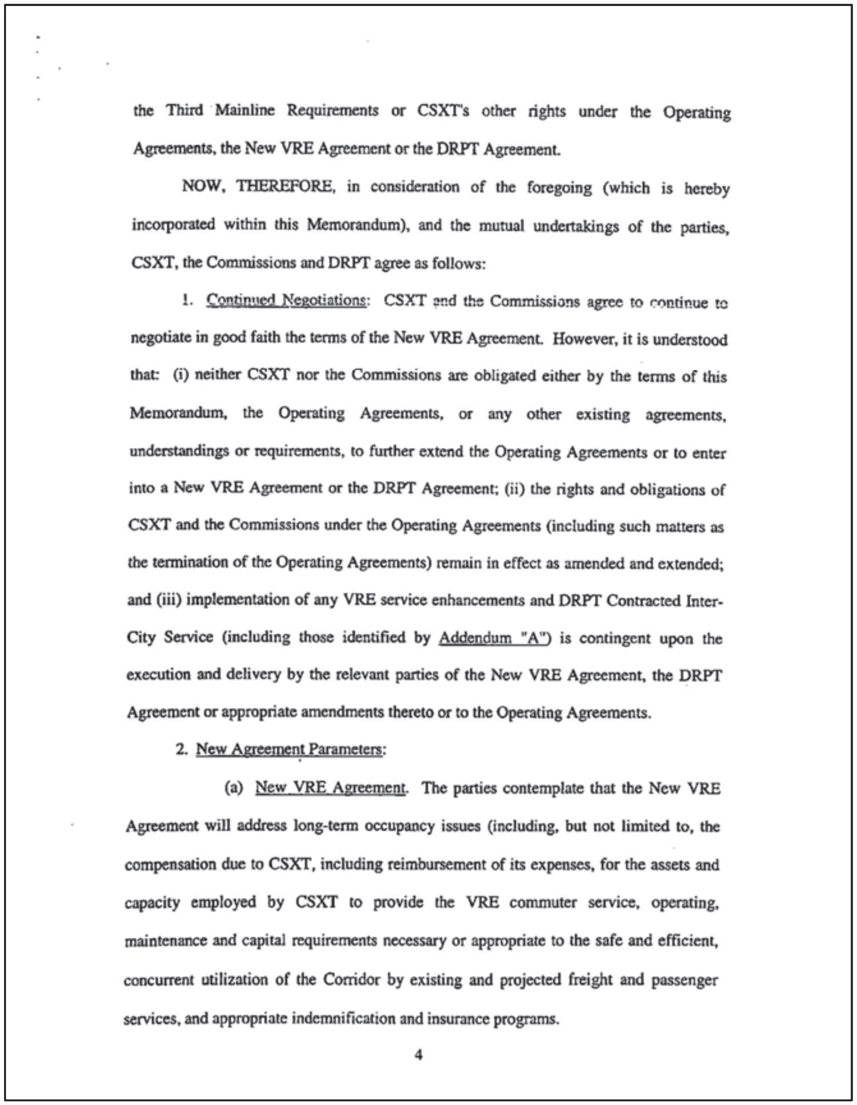
WHEREAS, the Corridor Task Force has already identified certain improvements, as more particularly described by Addendum "A" to this Memorandum, which will permit, subject to the terms of this Memorandum and prior to the completion of the entire Third Mainline Requirements, certain service enhancements, as more particularly described by Addendum "A"; and

WHEREAS, by subsequent addenda to the Memorandum, the parties intend to identify and agree upon the further improvements constituting the Corridor Improvement Project, the schedule and means for the implementation of such improvements and related service enhancements; and

WHEREAS, by this Memorandum, the parties wish to set forth their mutual understandings with respect to the process for consideration and phased implementation of the Corridor Improvement Project, without otherwise abrogating or diminishing the commitment of the Commissions, DRPT and the Commonwealth to the satisfaction of

3

CSXT (continued)



the Third Mainline Requirements or CSXT's other rights under the Operating Agreements, the New VRE Agreement or the DRPT Agreement.

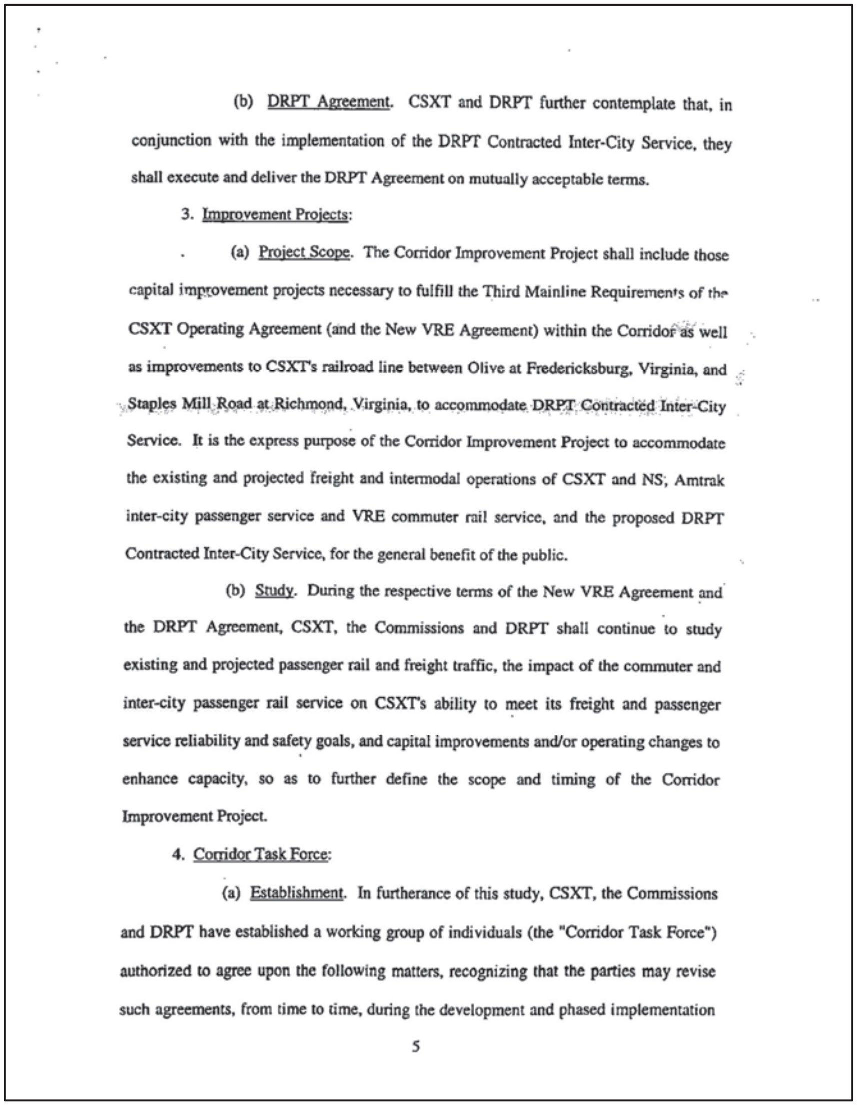
NOW, THEREFORE, in consideration of the foregoing (which is hereby incorporated within this Memorandum), and the mutual undertakings of the parties, CSXT, the Commissions and DRPT agree as follows:

1. Continued Negotiations: CSXT and the Commissions agree to continue to negotiate in good faith the terms of the New VRE Agreement. However, it is understood that: (i) neither CSXT nor the Commissions are obligated either by the terms of this Memorandum, the Operating Agreements, or any other existing agreements, understandings or requirements, to further extend the Operating Agreements or to enter into a New VRE Agreement or the DRPT Agreement; (ii) the rights and obligations of CSXT and the Commissions under the Operating Agreements (including such matters as the termination of the Operating Agreements) remain in effect as amended and extended; and (iii) implementation of any VRE service enhancements and DRPT Contracted Inter-City Service (including those identified by Addendum "A") is contingent upon the execution and delivery by the relevant parties of the New VRE Agreement, the DRPT Agreement or appropriate amendments thereto or to the Operating Agreements.

2. New Agreement Parameters:

(a) New VRE Agreement. The parties contemplate that the New VRE Agreement will address long-term occupancy issues (including, but not limited to, the compensation due to CSXT, including reimbursement of its expenses, for the assets and capacity employed by CSXT to provide the VRE commuter service, operating, maintenance and capital requirements necessary or appropriate to the safe and efficient, concurrent utilization of the Corridor by existing and projected freight and passenger services, and appropriate indemnification and insurance programs.

CSXT (continued)



(b) DRPT Agreement. CSXT and DRPT further contemplate that, in conjunction with the implementation of the DRPT Contracted Inter-City Service, they shall execute and deliver the DRPT Agreement on mutually acceptable terms.

3. Improvement Projects:

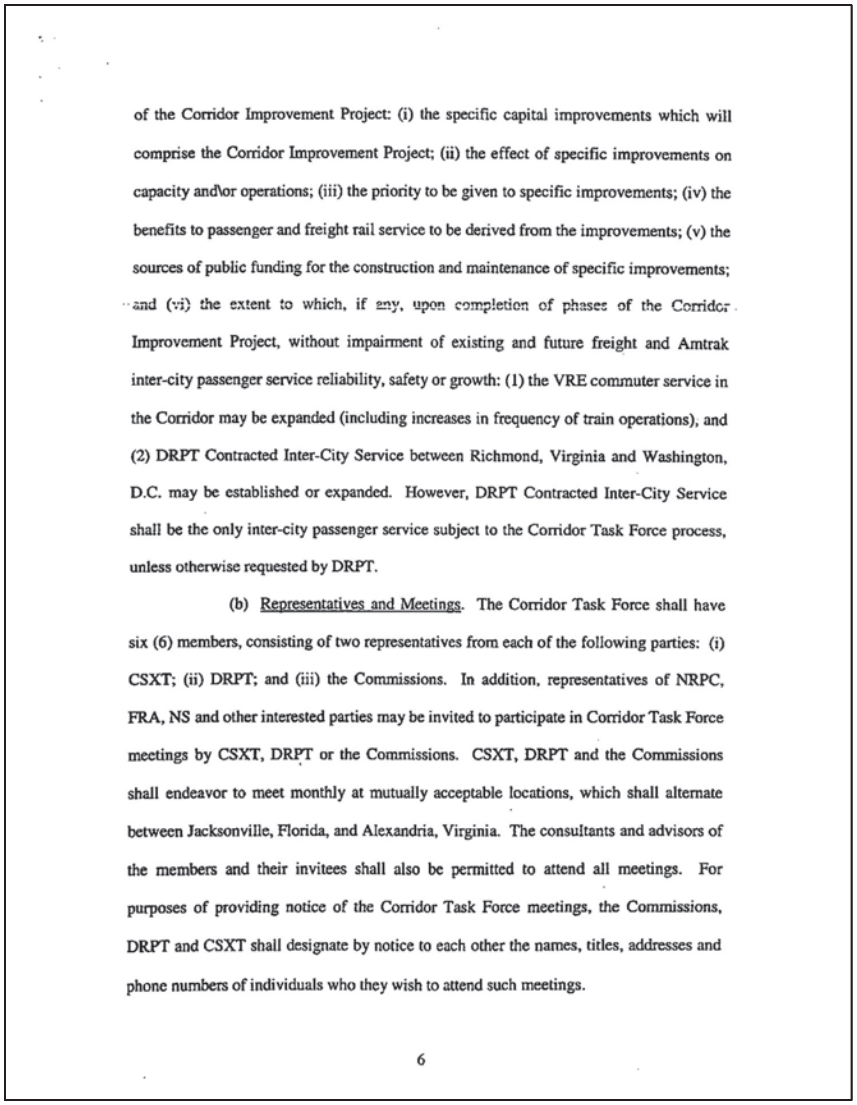
(a) Project Scope. The Corridor Improvement Project shall include those capital improvement projects necessary to fulfill the Third Mainline Requirements of the CSXT Operating Agreement (and the New VRE Agreement) within the Corridor as well as improvements to CSXT's railroad line between Olive at Fredericksburg, Virginia, and Staples Mill Road at Richmond, Virginia, to accommodate DRPT Contracted Inter-City Service. It is the express purpose of the Corridor Improvement Project to accommodate the existing and projected freight and intermodal operations of CSXT and NS; Amtrak inter-city passenger service and VRE commuter rail service, and the proposed DRPT Contracted Inter-City Service, for the general benefit of the public.

(b) Study. During the respective terms of the New VRE Agreement and the DRPT Agreement, CSXT, the Commissions and DRPT shall continue to study existing and projected passenger rail and freight traffic, the impact of the commuter and inter-city passenger rail service on CSXT's ability to meet its freight and passenger service reliability and safety goals, and capital improvements and/or operating changes to enhance capacity, so as to further define the scope and timing of the Corridor Improvement Project.

4. Corridor Task Force:

(a) Establishment. In furtherance of this study, CSXT, the Commissions and DRPT have established a working group of individuals (the "Corridor Task Force") authorized to agree upon the following matters, recognizing that the parties may revise such agreements, from time to time, during the development and phased implementation

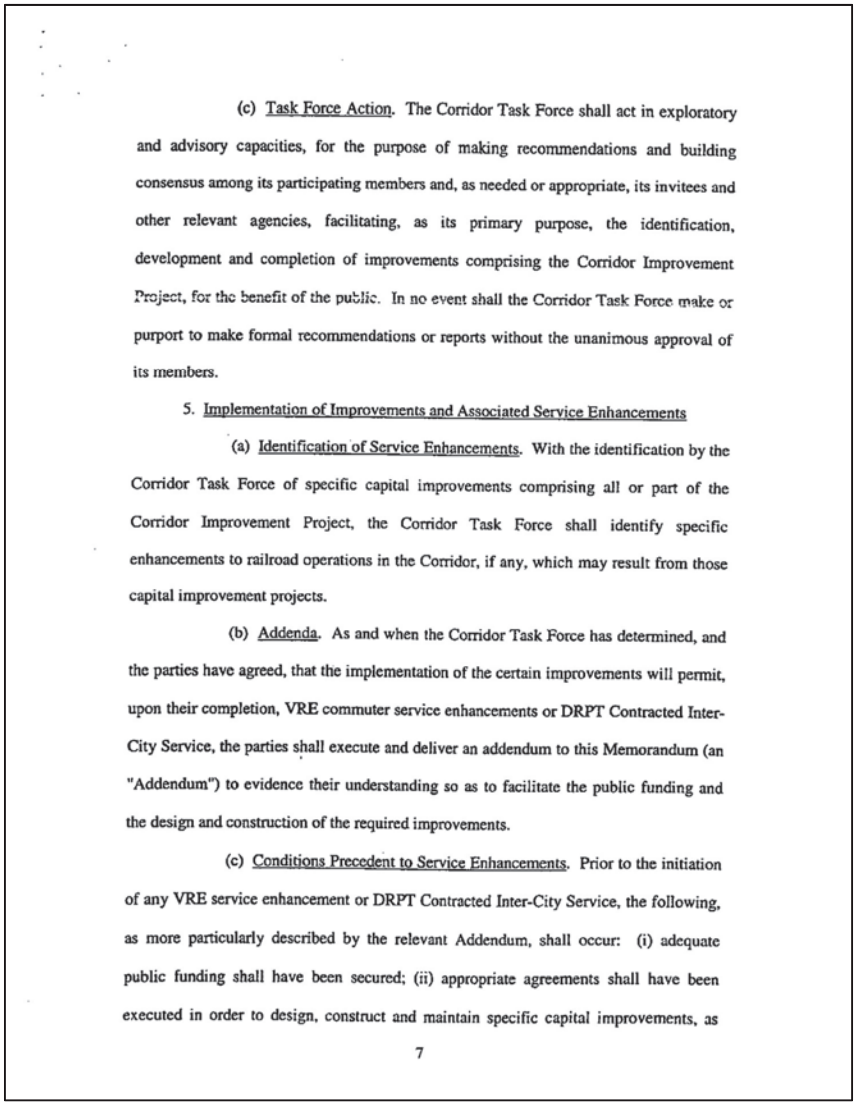
CSXT (continued)



of the Corridor Improvement Project: (i) the specific capital improvements which will comprise the Corridor Improvement Project; (ii) the effect of specific improvements on capacity and\or operations; (iii) the priority to be given to specific improvements; (iv) the benefits to passenger and freight rail service to be derived from the improvements; (v) the sources of public funding for the construction and maintenance of specific improvements; and (vi) the extent to which, if any, upon completion of phases of the Corridor Improvement Project, without impairment of existing and future freight and Amtrak inter-city passenger service reliability, safety or growth: (1) the VRE commuter service in the Corridor may be expanded (including increases in frequency of train operations), and (2) DRPT Contracted Inter-City Service between Richmond, Virginia and Washington, D.C. may be established or expanded. However, DRPT Contracted Inter-City Service shall be the only inter-city passenger service subject to the Corridor Task Force process, unless otherwise requested by DRPT.

(b) Representatives and Meetings. The Corridor Task Force shall have six (6) members, consisting of two representatives from each of the following parties: (i) CSXT; (ii) DRPT; and (iii) the Commissions. In addition, representatives of NRPC, FRA, NS and other interested parties may be invited to participate in Corridor Task Force meetings by CSXT, DRPT or the Commissions. CSXT, DRPT and the Commissions shall endeavor to meet monthly at mutually acceptable locations, which shall alternate between Jacksonville, Florida, and Alexandria, Virginia. The consultants and advisors of the members and their invitees shall also be permitted to attend all meetings. For purposes of providing notice of the Corridor Task Force meetings, the Commissions, DRPT and CSXT shall designate by notice to each other the names, titles, addresses and phone numbers of individuals who they wish to attend such meetings.

CSXT (continued)



(c) Task Force Action. The Corridor Task Force shall act in exploratory and advisory capacities, for the purpose of making recommendations and building consensus among its participating members and, as needed or appropriate, its invitees and other relevant agencies, facilitating, as its primary purpose, the identification, development and completion of improvements comprising the Corridor Improvement Project, for the benefit of the public. In no event shall the Corridor Task Force make or purport to make formal recommendations or reports without the unanimous approval of its members.

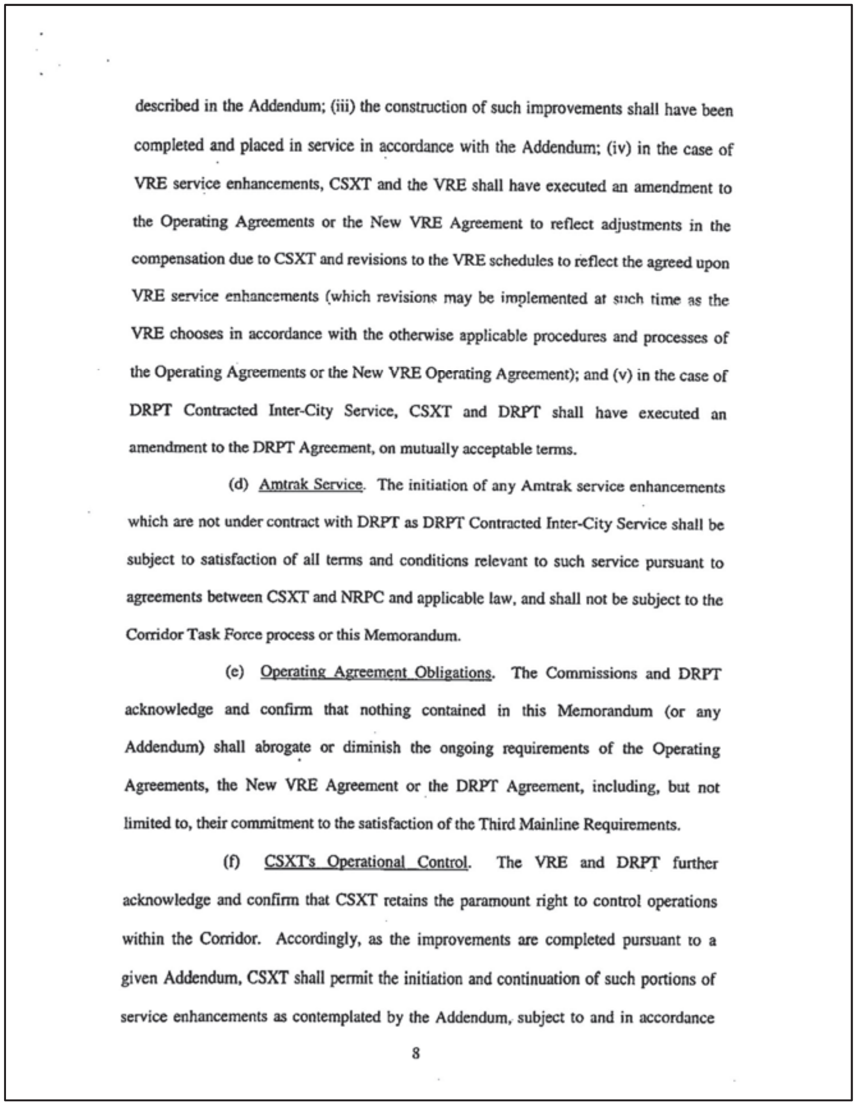
5. Implementation of Improvements and Associated Service Enhancements

(a) Identification of Service Enhancements. With the identification by the Corridor Task Force of specific capital improvements comprising all or part of the Corridor Improvement Project, the Corridor Task Force shall identify specific enhancements to railroad operations in the Corridor, if any, which may result from those capital improvement projects.

(b) Addenda. As and when the Corridor Task Force has determined, and the parties have agreed, that the implementation of the certain improvements will permit, upon their completion, VRE commuter service enhancements or DRPT Contracted Inter-City Service, the parties shall execute and deliver an addendum to this Memorandum (an "Addendum") to evidence their understanding so as to facilitate the public funding and the design and construction of the required improvements.

(c) Conditions Precedent to Service Enhancements. Prior to the initiation of any VRE service enhancement or DRPT Contracted Inter-City Service, the following, as more particularly described by the relevant Addendum, shall occur: (i) adequate public funding shall have been secured; (ii) appropriate agreements shall have been executed in order to design, construct and maintain specific capital improvements, as

CSXT (continued)



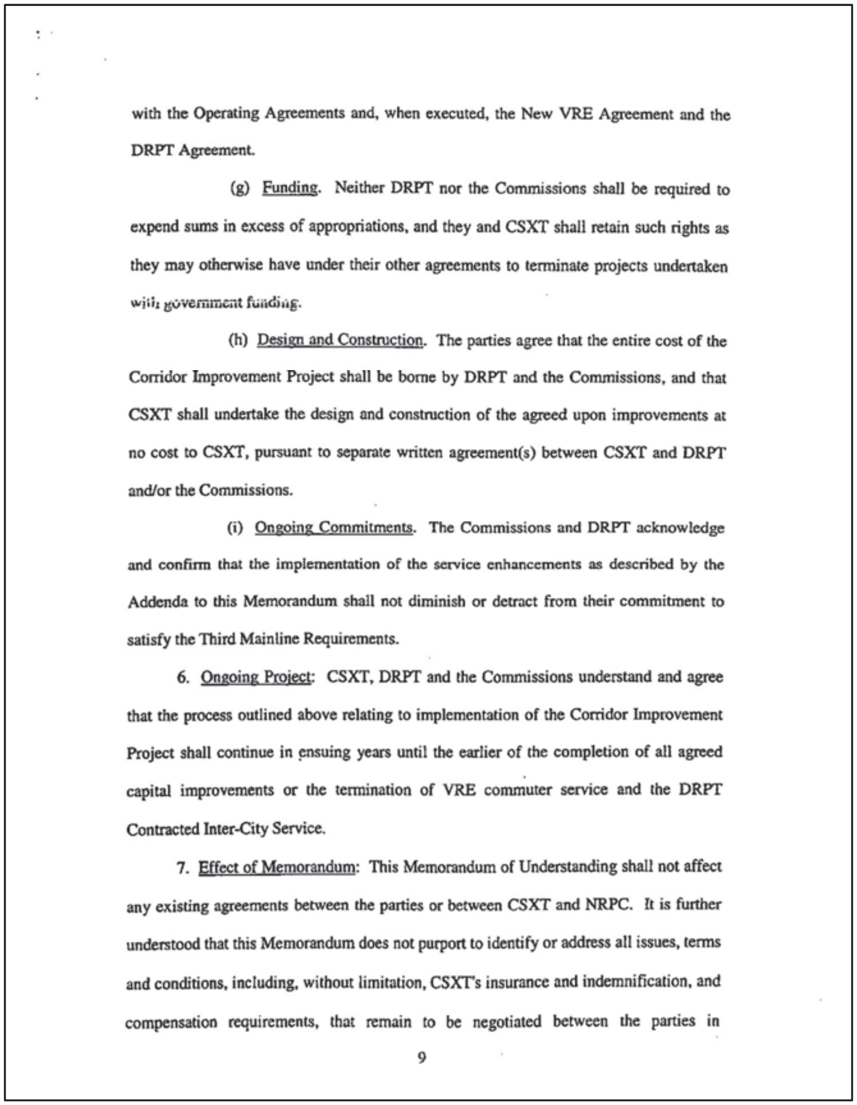
described in the Addendum; (iii) the construction of such improvements shall have been completed and placed in service in accordance with the Addendum; (iv) in the case of VRE service enhancements, CSXT and the VRE shall have executed an amendment to the Operating Agreements or the New VRE Agreement to reflect adjustments in the compensation due to CSXT and revisions to the VRE schedules to reflect the agreed upon VRE service enhancements (which revisions may be implemented at such time as the VRE chooses in accordance with the otherwise applicable procedures and processes of the Operating Agreements or the New VRE Operating Agreement); and (v) in the case of DRPT Contracted Inter-City Service, CSXT and DRPT shall have executed an amendment to the DRPT Agreement, on mutually acceptable terms.

(d) Amtrak Service. The initiation of any Amtrak service enhancements which are not under contract with DRPT as DRPT Contracted Inter-City Service shall be subject to satisfaction of all terms and conditions relevant to such service pursuant to agreements between CSXT and NRPC and applicable law, and shall not be subject to the Corridor Task Force process or this Memorandum.

(e) Operating Agreement Obligations. The Commissions and DRPT acknowledge and confirm that nothing contained in this Memorandum (or any Addendum) shall abrogate or diminish the ongoing requirements of the Operating Agreements, the New VRE Agreement or the DRPT Agreement, including, but not limited to, their commitment to the satisfaction of the Third Mainline Requirements.

(f) CSXT's Operational Control. The VRE and DRPT further acknowledge and confirm that CSXT retains the paramount right to control operations within the Corridor. Accordingly, as the improvements are completed pursuant to a given Addendum, CSXT shall permit the initiation and continuation of such portions of service enhancements as contemplated by the Addendum, subject to and in accordance

CSXT (continued)



with the Operating Agreements and, when executed, the New VRE Agreement and the DRPT Agreement.

(g) Funding. Neither DRPT nor the Commissions shall be required to expend sums in excess of appropriations, and they and CSXT shall retain such rights as they may otherwise have under their other agreements to terminate projects undertaken with government funding.

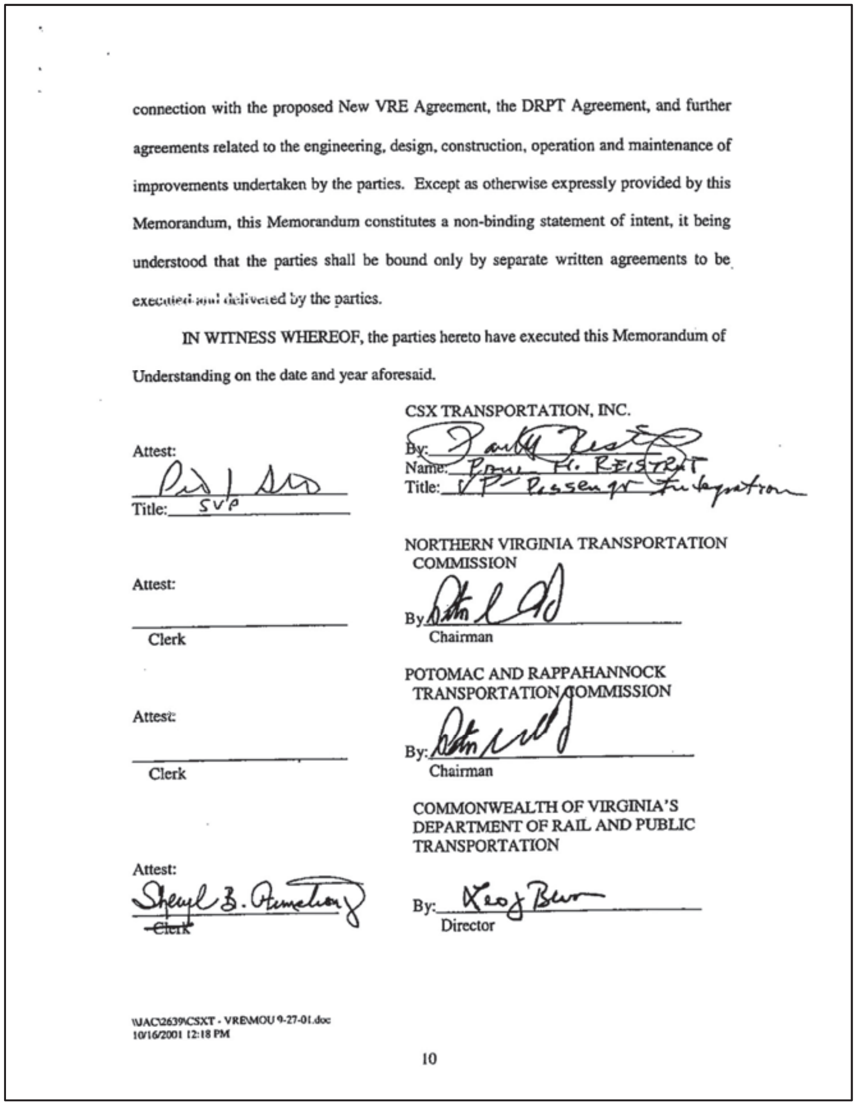
(h) Design and Construction. The parties agree that the entire cost of the Corridor Improvement Project shall be borne by DRPT and the Commissions, and that CSXT shall undertake the design and construction of the agreed upon improvements at no cost to CSXT, pursuant to separate written agreement(s) between CSXT and DRPT and/or the Commissions.

(i) Ongoing Commitments. The Commissions and DRPT acknowledge and confirm that the implementation of the service enhancements as described by the Addenda to this Memorandum shall not diminish or detract from their commitment to satisfy the Third Mainline Requirements.

6. Ongoing Project: CSXT, DRPT and the Commissions understand and agree that the process outlined above relating to implementation of the Corridor Improvement Project shall continue in ensuing years until the earlier of the completion of all agreed capital improvements or the termination of VRE commuter service and the DRPT Contracted Inter-City Service.

7. Effect of Memorandum: This Memorandum of Understanding shall not affect any existing agreements between the parties or between CSXT and NRPC. It is further understood that this Memorandum does not purport to identify or address all issues, terms and conditions, including, without limitation, CSXT's insurance and indemnification, and compensation requirements, that remain to be negotiated between the parties in

CSXT (continued)



connection with the proposed New VRE Agreement, the DRPT Agreement, and further agreements related to the engineering, design, construction, operation and maintenance of improvements undertaken by the parties. Except as otherwise expressly provided by this Memorandum, this Memorandum constitutes a non-binding statement of intent, it being understood that the parties shall be bound only by separate written agreements to be executed and delivered by the parties.

IN WITNESS WHEREOF, the parties hereto have executed this Memorandum of Understanding on the date and year aforesaid.

DRAFT OF 9/27/01

ADDENDUM "A"
TO MEMORANDUM OF UNDERSTANDING
GROUP 1 INTERIM IMPROVEMENTS

This ADDENDUM "A" TO MEMORANDUM OF UNDERSTANDING (this "Addendum") is made by and among CSX TRANSPORTATION, INC. ("CSXT"), the NORTHERN VIRGINIA TRANSPORTATION COMMISSION and the POTOMAC AND RAPPAHANNOCK TRANSPORTATION COMMISSION (jointly and severally, the "Commissions"), and the COMMONWEALTH OF VIRGINIA'S DEPARTMENT OF RAIL AND PUBLIC TRANSPORTATION ("DRPT").

Explanatory Statement

This Addendum is executed and delivered by the parties to evidence their understanding, pursuant to Section 5(b) of the Memorandum of Understanding dated as of ____________, 2001, as amended from time to time, among the parties (the "Memorandum"), as to the construction of specific improvements, the maintenance and operation of such improvements and the implementation of associated enhancements in rail service, in accordance with the terms and conditions of this Addendum and the Memorandum.

NOW, THEREFORE, in consideration of the foregoing Explanatory Statement and other good and valuable consideration, the receipt and sufficiency of which are acknowledged by the parties, the parties agree as follows:

1. Definitions. All capitalized terms not otherwise defined by this Addendum shall have the meanings ascribed to them by the Memorandum.

2. Improvements. The parties acknowledge that, in accordance with the Memorandum, they have identified and agreed upon the improvements more particularly described by Exhibit A to this Addendum, as constituting some of the improvements encompassed by the Corridor Improvement Project (the "Phase I, II, III and IV Improvements" or, collectively, the "Group 1 Interim Improvements").

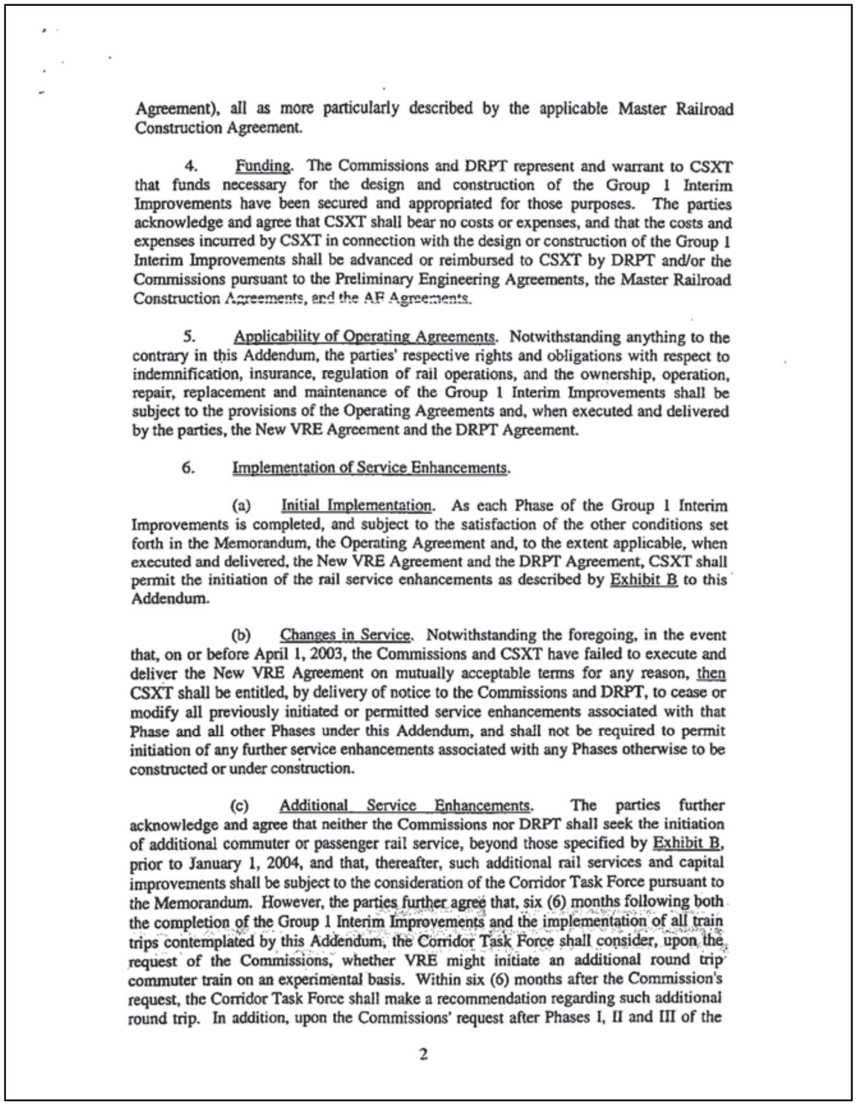
3. Construction and Design.

(a) Preliminary Engineering and Design. Pursuant to separate written Preliminary Engineering Agreements between CSXT and DRPT or the Commissions, CSXT shall perform preliminary engineering and design services to better define the Group 1 Interim Improvements (other than the AF Interlocking Project which is currently under construction pursuant to the Railroad Reimbursement Agreement dated August 20, 1999, as amended, between CSXT and the Commissions [the "AF Agreement"]), so as to permit the commencement of the construction of the Group 1 Interim Improvements, all as more particularly described by such Preliminary Engineering Agreements.

(b) Construction. Pursuant to a separate Master Railroad Construction Agreement between CSXT and either the Commissions or DRPT, CSXT shall construct, cause to be constructed, or oversee the final design and construction of the Group 1 Interim Improvements (other than the AF Interlocking Project which is subject to the AF

1

CSXT (continued)



Agreement), all as more particularly described by the applicable Master Railroad Construction Agreement.

4. Funding. The Commissions and DRPT represent and warrant to CSXT that funds necessary for the design and construction of the Group 1 Interim Improvements have been secured and appropriated for those purposes. The parties acknowledge and agree that CSXT shall bear no costs or expenses, and that the costs and expenses incurred by CSXT in connection with the design or construction of the Group 1 Interim Improvements shall be advanced or reimbursed to CSXT by DRPT and/or the Commissions pursuant to the Preliminary Engineering Agreements, the Master Railroad Construction Agreements, and the AE Agreements.

5. Applicability of Operating Agreements. Notwithstanding anything to the contrary in this Addendum, the parties' respective rights and obligations with respect to indemnification, insurance, regulation of rail operations, and the ownership, operation, repair, replacement and maintenance of the Group 1 Interim Improvements shall be subject to the provisions of the Operating Agreements and, when executed and delivered by the parties, the New VRE Agreement and the DRPT Agreement.

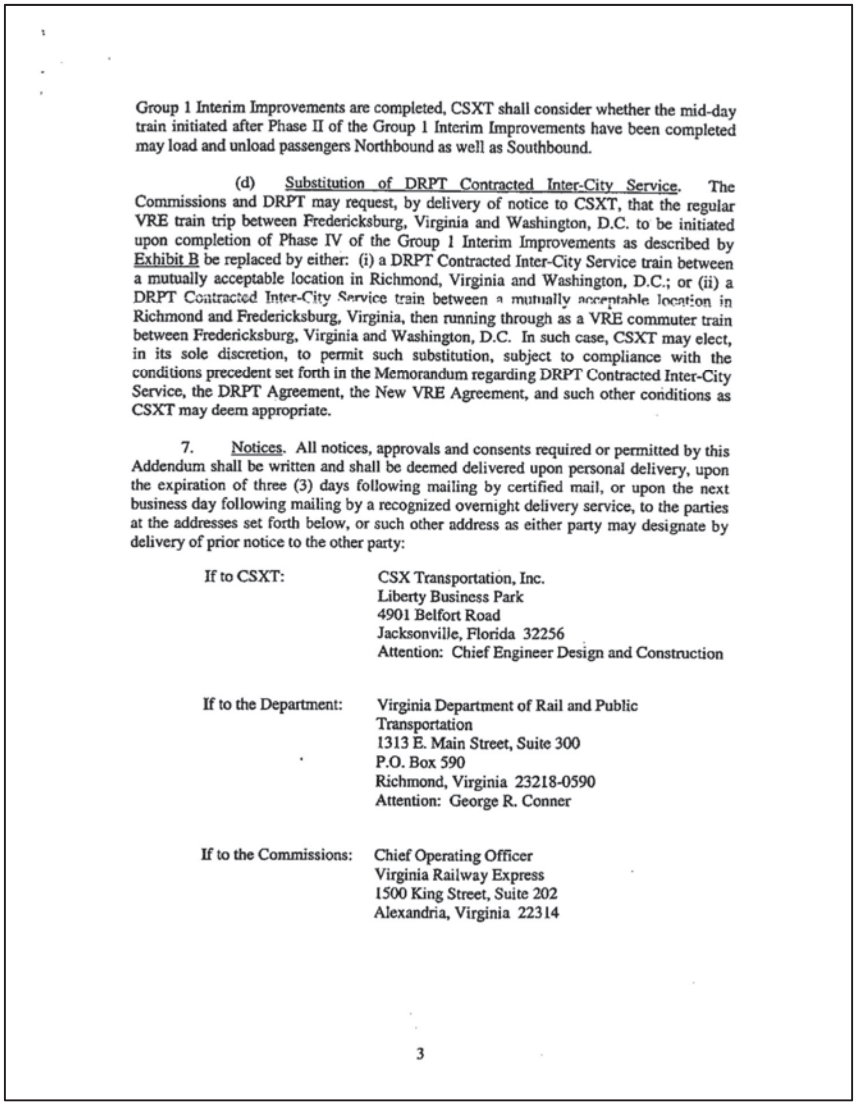
6. Implementation of Service Enhancements.

(a) Initial Implementation. As each Phase of the Group 1 Interim Improvements is completed, and subject to the satisfaction of the other conditions set forth in the Memorandum, the Operating Agreement and, to the extent applicable, when executed and delivered, the New VRE Agreement and the DRPT Agreement, CSXT shall permit the initiation of the rail service enhancements as described by Exhibit B to this Addendum.

(b) Changes in Service. Notwithstanding the foregoing, in the event that, on or before April 1, 2003, the Commissions and CSXT have failed to execute and deliver the New VRE Agreement on mutually acceptable terms for any reason, then CSXT shall be entitled, by delivery of notice to the Commissions and DRPT, to cease or modify all previously initiated or permitted service enhancements associated with that Phase and all other Phases under this Addendum, and shall not be required to permit initiation of any further service enhancements associated with any Phases otherwise to be constructed or under construction.

(c) Additional Service Enhancements. The parties further acknowledge and agree that neither the Commissions nor DRPT shall seek the initiation of additional commuter or passenger rail service, beyond those specified by Exhibit B, prior to January 1, 2004, and that, thereafter, such additional rail services and capital improvements shall be subject to the consideration of the Corridor Task Force pursuant to the Memorandum. However, the parties further agree that, six (6) months following both the completion of the Group 1 Interim Improvements and the implementation of all train trips contemplated by this Addendum, the Corridor Task Force shall consider, upon the request of the Commissions, whether VRE might initiate an additional round trip commuter train on an experimental basis. Within six (6) months after the Commission's request, the Corridor Task Force shall make a recommendation regarding such additional round trip. In addition, upon the Commissions' request after Phases I, II and III of the

CSXT (continued)



Group 1 Interim Improvements are completed, CSXT shall consider whether the mid-day train initiated after Phase II of the Group 1 Interim Improvements have been completed may load and unload passengers Northbound as well as Southbound.

(d) Substitution of DRPT Contracted Inter-City Service. The Commissions and DRPT may request, by delivery of notice to CSXT, that the regular VRE train trip between Fredericksburg, Virginia and Washington, D.C. to be initiated upon completion of Phase IV of the Group 1 Interim Improvements as described by Exhibit B be replaced by either: (i) a DRPT Contracted Inter-City Service train between a mutually acceptable location in Richmond, Virginia and Washington, D.C.; or (ii) a DRPT Contracted Inter-City Service train between a mutually acceptable location in Richmond and Fredericksburg, Virginia, then running through as a VRE commuter train between Fredericksburg, Virginia and Washington, D.C. In such case, CSXT may elect, in its sole discretion, to permit such substitution, subject to compliance with the conditions precedent set forth in the Memorandum regarding DRPT Contracted Inter-City Service, the DRPT Agreement, the New VRE Agreement, and such other conditions as CSXT may deem appropriate.

7. Notices. All notices, approvals and consents required or permitted by this Addendum shall be written and shall be deemed delivered upon personal delivery, upon the expiration of three (3) days following mailing by certified mail, or upon the next business day following mailing by a recognized overnight delivery service, to the parties at the addresses set forth below, or such other address as either party may designate by delivery of prior notice to the other party:

If to CSXT:
CSX Transportation, Inc.

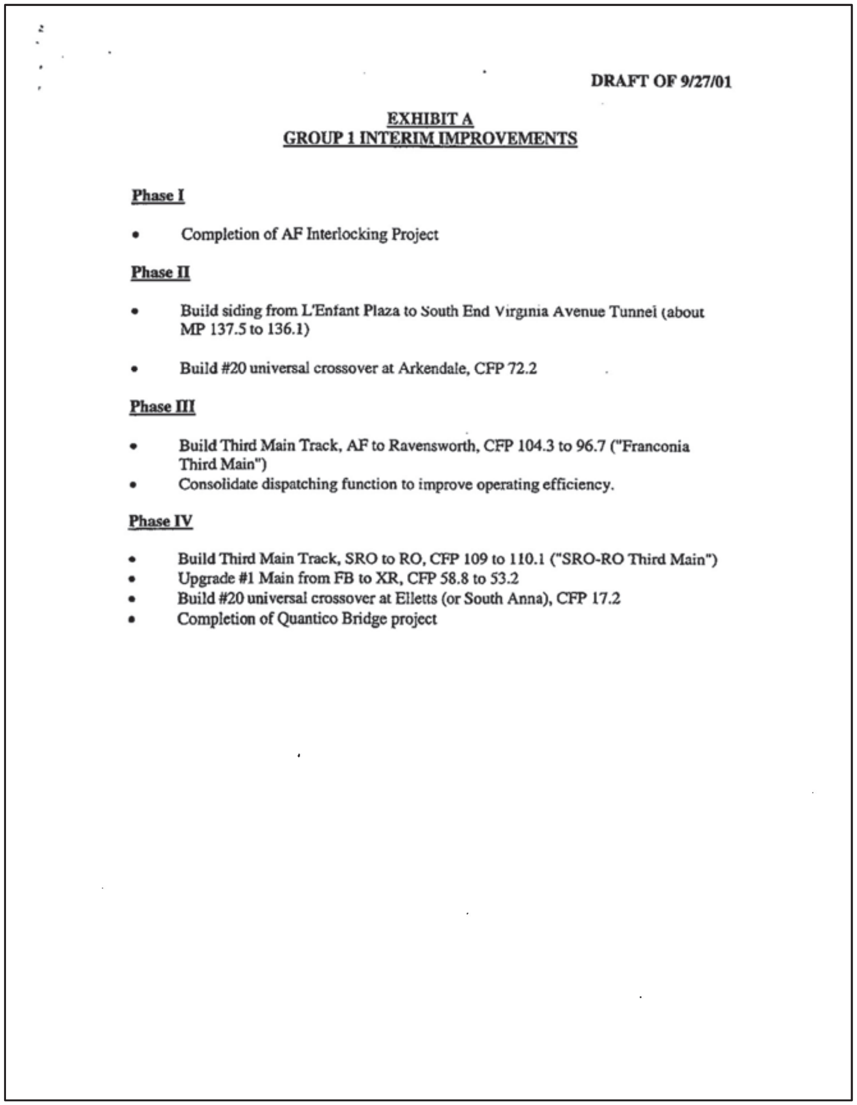
Exhibit A	Group 1 Interim Improvements
Exhibit B	Group 1 Interim Improvements and Service Implementation Schedule

CSXT (continued)



DRAFT OF 9/27/01

EXHIBIT A
GROUP 1 INTERIM IMPROVEMENTS

Phase I

- Completion of AF Interlocking Project

Phase II

- Build siding from L'Enfant Plaza to South End Virginia Avenue Tunnel (about MP 137.5 to 136.1)
- Build #20 universal crossover at Arkendale, CFP 72.2

Phase III

- Build Third Main Track, AF to Ravensworth, CFP 104.3 to 96.7 ("Franconia Third Main")
- Consolidate dispatching function to improve operating efficiency.

Phase IV

- Build Third Main Track, SRO to RO, CFP 109 to 110.1 ("SRO-RO Third Main")
- Upgrade #1 Main from FB to XR, CFP 58.8 to 53.2
- Build #20 universal crossover at Elletts (or South Anna), CFP 17.2
- Completion of Quantico Bridge project

CSXT (continued)

EXHIBIT B
GROUP 1 INTERIM IMPROVEMENT AND SERVICE ENHANCEMENT SCHEDULE

PHASE	PROJECTS	TRAINS ADDED	ESTIMATED PROJECT COMPLETION DATE[1]
I	• AF Interlocking (in progress)[2]	• 1 Experimental Special Mid-Day VRE Train - Monday - Thursday Only[3] • 1 Regular Mid-Day VRE Train - Friday Only	4Q '01
II	• L'Enfant 3rd Main • Arkendale Crossovers	• 1 Regular Daily Mid-Day VRE Train - Monday - Friday[4]	1Q '03
III	• Franconia 3rd Main • Consolidation of Dispatch Functions	• 1 Round Trip Fredericksburg VRE Train[5]	4Q '03

---

[1] Project construction timelines and completion dates will be determined by related preliminary engineering studies and shall be subject to change as provided by the Addendum. Proposed passenger trains will not be added until the related projects are completed.

[2] It is assumed that AF Interlocking will be substantially completed by September, 2001, pursuant to the Railroad Reimbursement Agreement between CSXT and the Commissions dated August 20, 1999, as amended.

[3] This train will run as a Special Train on an experimental basis as provided by the Addendum. On completion of Phase I improvements, this train will be deemed a regular train. See FN 4 below.

[4] After Phase I and Phase II of the Group 1 Interim Improvements are completed, the Phase I VRE trains shall be deemed one regular mid-day train running Monday through Friday. Phase I and II VRE trains will load and unload Southbound only.

[5] This train will run during commuter peak hours.

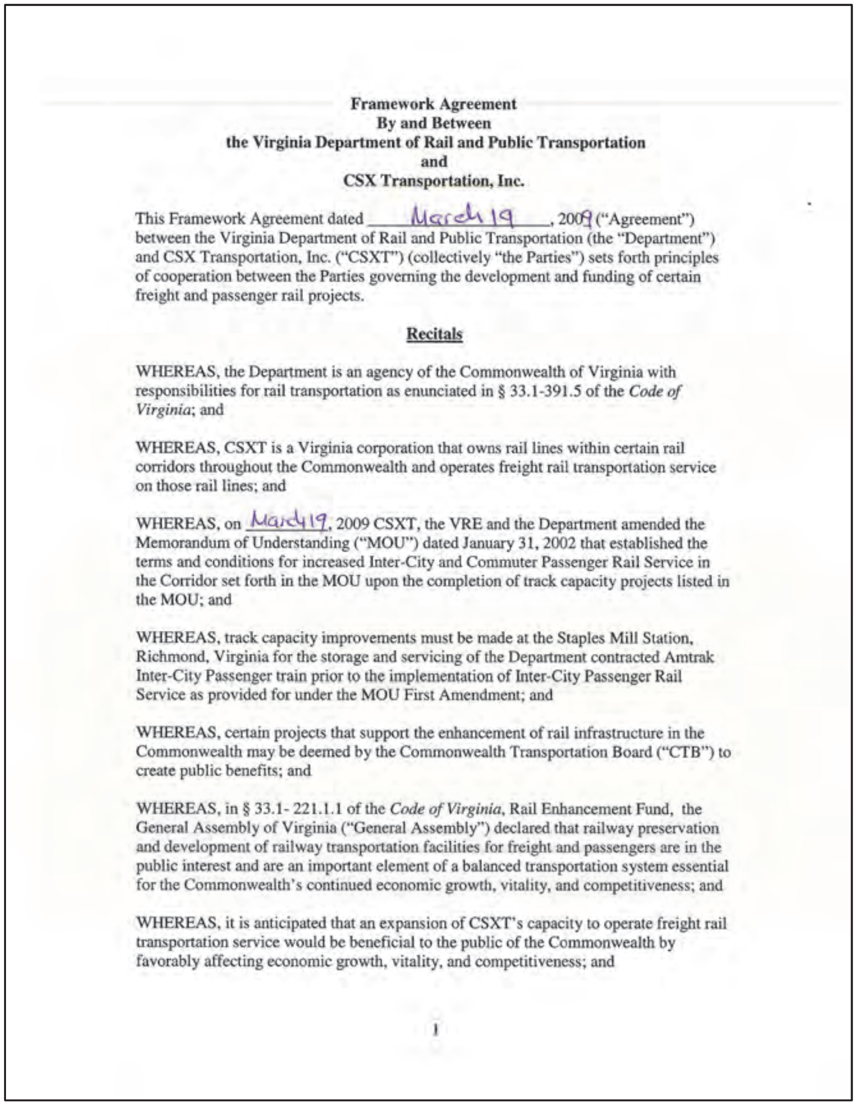
EXHIBIT D

CSXT (continued)



Framework Agreement
By and Between
the Virginia Department of Rail and Public Transportation
and
CSX Transportation, Inc.

This Framework Agreement dated March 19, 2009 ("Agreement") between the Virginia Department of Rail and Public Transportation (the "Department") and CSX Transportation, Inc. ("CSXT") (collectively "the Parties") sets forth principles of cooperation between the Parties governing the development and funding of certain freight and passenger rail projects.

Recitals

WHEREAS, the Department is an agency of the Commonwealth of Virginia with responsibilities for rail transportation as enunciated in § 33.1-391.5 of the *Code of Virginia*; and

WHEREAS, CSXT is a Virginia corporation that owns rail lines within certain rail corridors throughout the Commonwealth and operates freight rail transportation service on those rail lines; and

WHEREAS, on March 19, 2009 CSXT, the VRE and the Department amended the Memorandum of Understanding ("MOU") dated January 31, 2002 that established the terms and conditions for increased Inter-City and Commuter Passenger Rail Service in the Corridor set forth in the MOU upon the completion of track capacity projects listed in the MOU; and

WHEREAS, track capacity improvements must be made at the Staples Mill Station, Richmond, Virginia for the storage and servicing of the Department contracted Amtrak Inter-City Passenger train prior to the implementation of Inter-City Passenger Rail Service as provided for under the MOU First Amendment; and

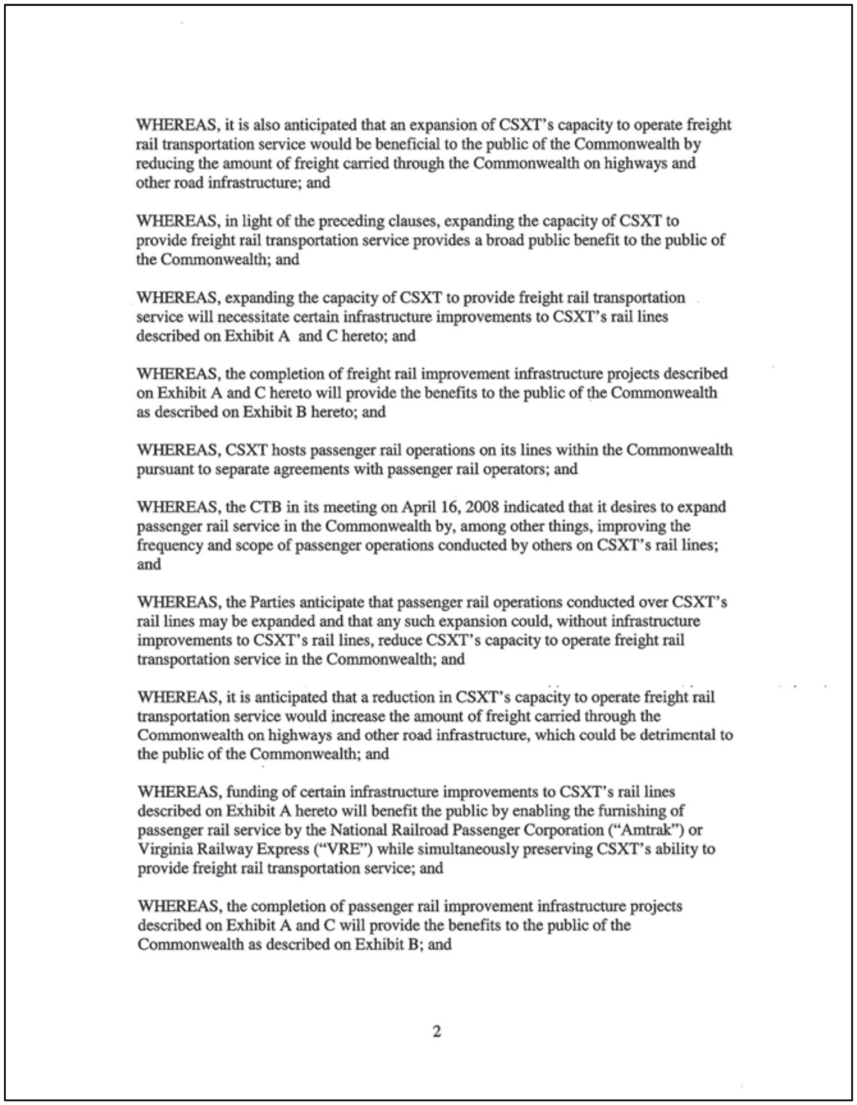
WHEREAS, certain projects that support the enhancement of rail infrastructure in the Commonwealth may be deemed by the Commonwealth Transportation Board ("CTB") to create public benefits; and

WHEREAS, in § 33.1- 221.1.1 of the *Code of Virginia*, Rail Enhancement Fund, the General Assembly of Virginia ("General Assembly") declared that railway preservation and development of railway transportation facilities for freight and passengers are in the public interest and are an important element of a balanced transportation system essential for the Commonwealth's continued economic growth, vitality, and competitiveness; and

WHEREAS, it is anticipated that an expansion of CSXT's capacity to operate freight rail transportation service would be beneficial to the public of the Commonwealth by favorably affecting economic growth, vitality, and competitiveness; and

1

CSXT (continued)



WHEREAS, it is also anticipated that an expansion of CSXT's capacity to operate freight rail transportation service would be beneficial to the public of the Commonwealth by reducing the amount of freight carried through the Commonwealth on highways and other road infrastructure; and

WHEREAS, in light of the preceding clauses, expanding the capacity of CSXT to provide freight rail transportation service provides a broad public benefit to the public of the Commonwealth; and

WHEREAS, expanding the capacity of CSXT to provide freight rail transportation service will necessitate certain infrastructure improvements to CSXT's rail lines described on Exhibit A and C hereto; and

WHEREAS, the completion of freight rail improvement infrastructure projects described on Exhibit A and C hereto will provide the benefits to the public of the Commonwealth as described on Exhibit B hereto; and

WHEREAS, CSXT hosts passenger rail operations on its lines within the Commonwealth pursuant to separate agreements with passenger rail operators; and

WHEREAS, the CTB in its meeting on April 16, 2008 indicated that it desires to expand passenger rail service in the Commonwealth by, among other things, improving the frequency and scope of passenger operations conducted by others on CSXT's rail lines; and

WHEREAS, the Parties anticipate that passenger rail operations conducted over CSXT's rail lines may be expanded and that any such expansion could, without infrastructure improvements to CSXT's rail lines, reduce CSXT's capacity to operate freight rail transportation service in the Commonwealth; and

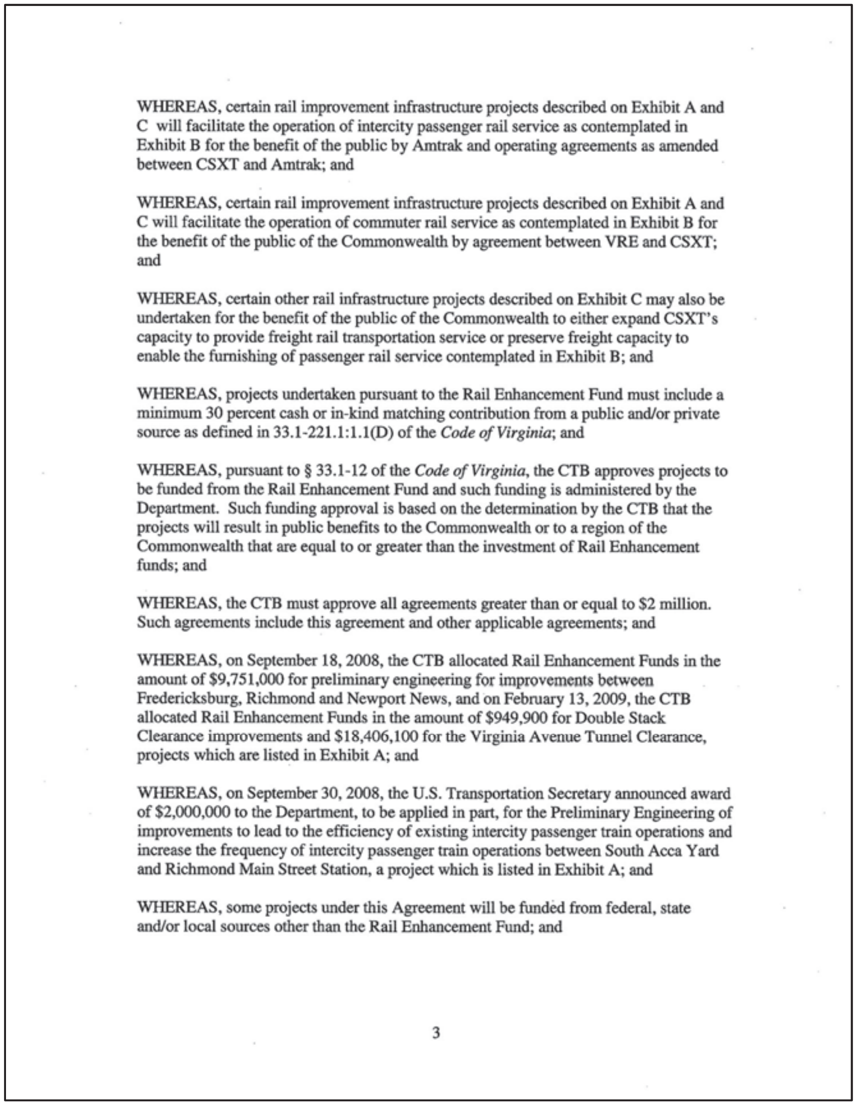
WHEREAS, it is anticipated that a reduction in CSXT's capacity to operate freight rail transportation service would increase the amount of freight carried through the Commonwealth on highways and other road infrastructure, which could be detrimental to the public of the Commonwealth; and

WHEREAS, funding of certain infrastructure improvements to CSXT's rail lines described on Exhibit A hereto will benefit the public by enabling the furnishing of passenger rail service by the National Railroad Passenger Corporation ("Amtrak") or Virginia Railway Express ("VRE") while simultaneously preserving CSXT's ability to provide freight rail transportation service; and

WHEREAS, the completion of passenger rail improvement infrastructure projects described on Exhibit A and C will provide the benefits to the public of the Commonwealth as described on Exhibit B; and

2

CSXT (continued)



WHEREAS, certain rail improvement infrastructure projects described on Exhibit A and C will facilitate the operation of intercity passenger rail service as contemplated in Exhibit B for the benefit of the public by Amtrak and operating agreements as amended between CSXT and Amtrak; and

WHEREAS, certain rail improvement infrastructure projects described on Exhibit A and C will facilitate the operation of commuter rail service as contemplated in Exhibit B for the benefit of the public of the Commonwealth by agreement between VRE and CSXT; and

WHEREAS, certain other rail infrastructure projects described on Exhibit C may also be undertaken for the benefit of the public of the Commonwealth to either expand CSXT's capacity to provide freight rail transportation service or preserve freight capacity to enable the furnishing of passenger rail service contemplated in Exhibit B; and

WHEREAS, projects undertaken pursuant to the Rail Enhancement Fund must include a minimum 30 percent cash or in-kind matching contribution from a public and/or private source as defined in 33.1-221.1:1.1(D) of the *Code of Virginia*; and

WHEREAS, pursuant to § 33.1-12 of the *Code of Virginia*, the CTB approves projects to be funded from the Rail Enhancement Fund and such funding is administered by the Department. Such funding approval is based on the determination by the CTB that the projects will result in public benefits to the Commonwealth or to a region of the Commonwealth that are equal to or greater than the investment of Rail Enhancement funds; and

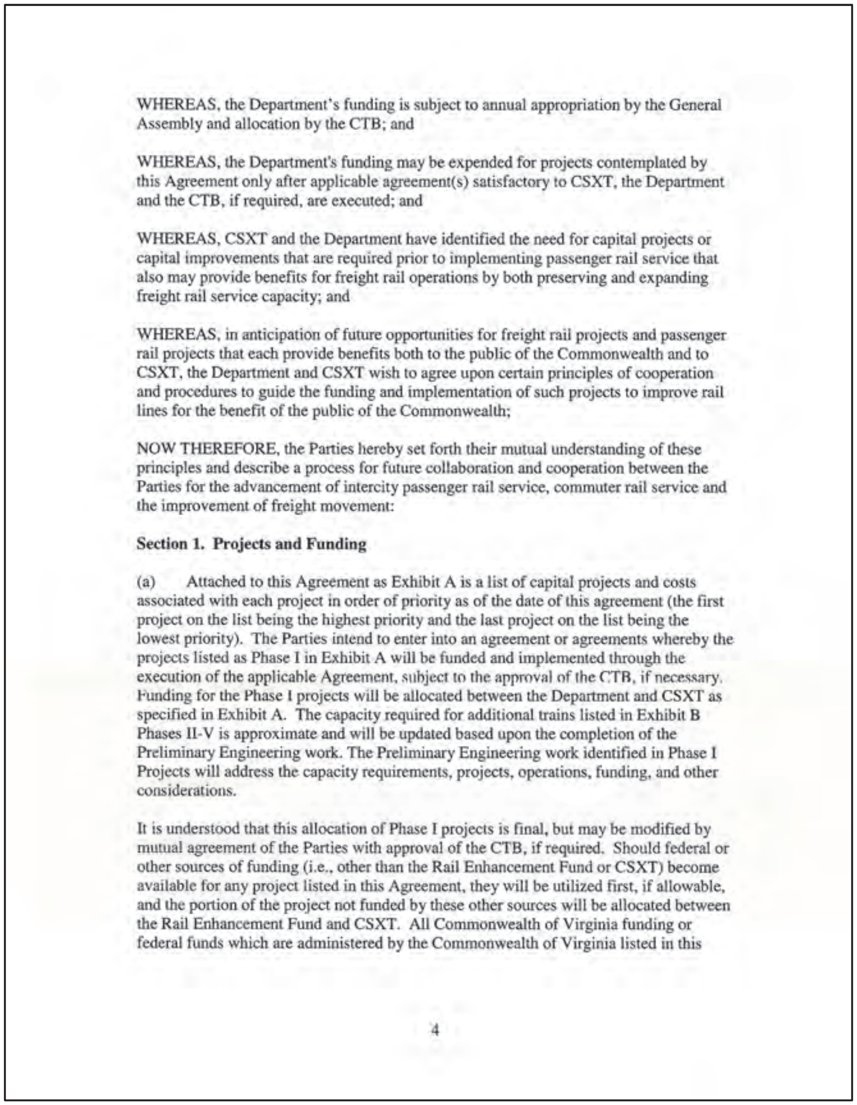
WHEREAS, the CTB must approve all agreements greater than or equal to $2 million. Such agreements include this agreement and other applicable agreements; and

WHEREAS, on September 18, 2008, the CTB allocated Rail Enhancement Funds in the amount of $9,751,000 for preliminary engineering for improvements between Fredericksburg, Richmond and Newport News, and on February 13, 2009, the CTB allocated Rail Enhancement Funds in the amount of $949,900 for Double Stack Clearance improvements and $18,406,100 for the Virginia Avenue Tunnel Clearance, projects which are listed in Exhibit A; and

WHEREAS, on September 30, 2008, the U.S. Transportation Secretary announced award of $2,000,000 to the Department, to be applied in part, for the Preliminary Engineering of improvements to lead to the efficiency of existing intercity passenger train operations and increase the frequency of intercity passenger train operations between South Acca Yard and Richmond Main Street Station, a project which is listed in Exhibit A; and

WHEREAS, some projects under this Agreement will be funded from federal, state and/or local sources other than the Rail Enhancement Fund; and

CSXT (continued)



WHEREAS, the Department's funding is subject to annual appropriation by the General Assembly and allocation by the CTB; and

WHEREAS, the Department's funding may be expended for projects contemplated by this Agreement only after applicable agreement(s) satisfactory to CSXT, the Department and the CTB, if required, are executed; and

WHEREAS, CSXT and the Department have identified the need for capital projects or capital improvements that are required prior to implementing passenger rail service that also may provide benefits for freight rail operations by both preserving and expanding freight rail service capacity; and

WHEREAS, in anticipation of future opportunities for freight rail projects and passenger rail projects that each provide benefits both to the public of the Commonwealth and to CSXT, the Department and CSXT wish to agree upon certain principles of cooperation and procedures to guide the funding and implementation of such projects to improve rail lines for the benefit of the public of the Commonwealth;

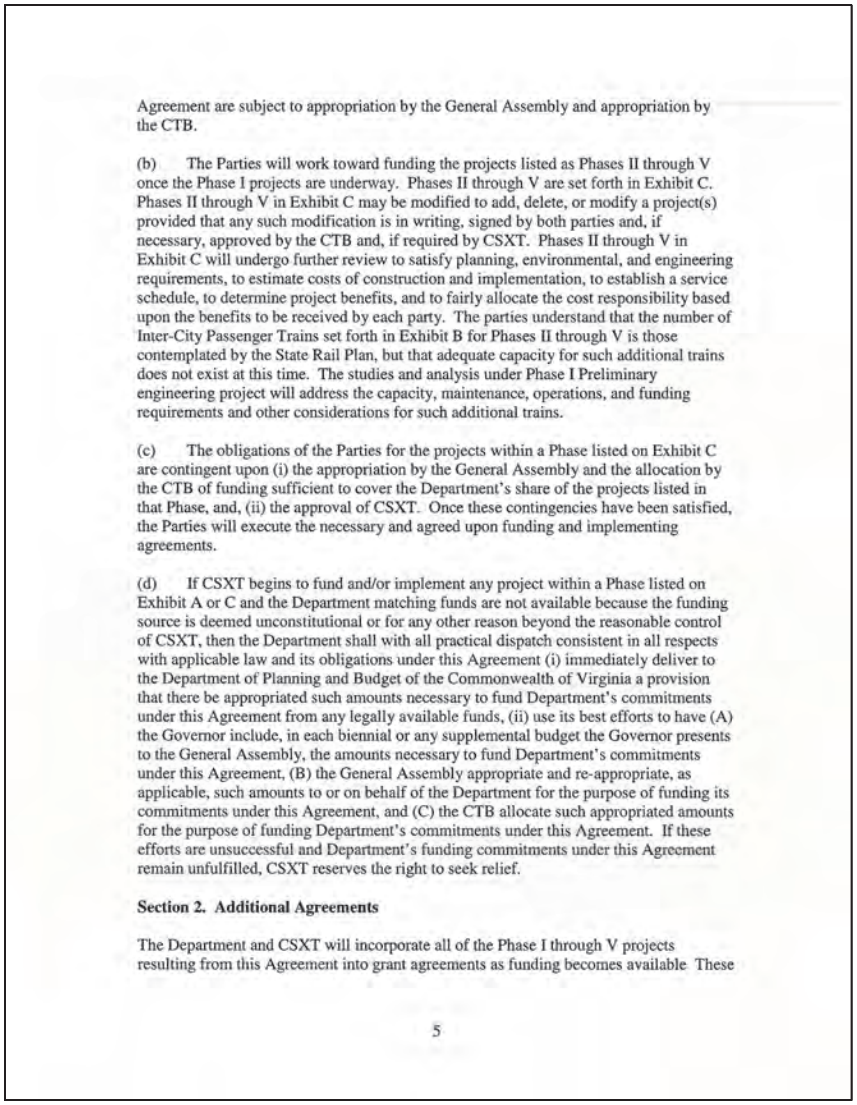
NOW THEREFORE, the Parties hereby set forth their mutual understanding of these principles and describe a process for future collaboration and cooperation between the Parties for the advancement of intercity passenger rail service, commuter rail service and the improvement of freight movement:

Section 1. Projects and Funding

(a) Attached to this Agreement as Exhibit A is a list of capital projects and costs associated with each project in order of priority as of the date of this agreement (the first project on the list being the highest priority and the last project on the list being the lowest priority). The Parties intend to enter into an agreement or agreements whereby the projects listed as Phase I in Exhibit A will be funded and implemented through the execution of the applicable Agreement, subject to the approval of the CTB, if necessary. Funding for the Phase I projects will be allocated between the Department and CSXT as specified in Exhibit A. The capacity required for additional trains listed in Exhibit B Phases II-V is approximate and will be updated based upon the completion of the Preliminary Engineering work. The Preliminary Engineering work identified in Phase I Projects will address the capacity requirements, projects, operations, funding, and other considerations.

It is understood that this allocation of Phase I projects is final, but may be modified by mutual agreement of the Parties with approval of the CTB, if required. Should federal or other sources of funding (i.e., other than the Rail Enhancement Fund or CSXT) become available for any project listed in this Agreement, they will be utilized first, if allowable, and the portion of the project not funded by these other sources will be allocated between the Rail Enhancement Fund and CSXT. All Commonwealth of Virginia funding or federal funds which are administered by the Commonwealth of Virginia listed in this

CSXT (continued)



Agreement are subject to appropriation by the General Assembly and appropriation by the CTB.

(b) The Parties will work toward funding the projects listed as Phases II through V once the Phase I projects are underway. Phases II through V are set forth in Exhibit C. Phases II through V in Exhibit C may be modified to add, delete, or modify a project(s) provided that any such modification is in writing, signed by both parties and, if necessary, approved by the CTB and, if required by CSXT. Phases II through V in Exhibit C will undergo further review to satisfy planning, environmental, and engineering requirements, to estimate costs of construction and implementation, to establish a service schedule, to determine project benefits, and to fairly allocate the cost responsibility based upon the benefits to be received by each party. The parties understand that the number of Inter-City Passenger Trains set forth in Exhibit B for Phases II through V is those contemplated by the State Rail Plan, but that adequate capacity for such additional trains does not exist at this time. The studies and analysis under Phase I Preliminary engineering project will address the capacity, maintenance, operations, and funding requirements and other considerations for such additional trains.

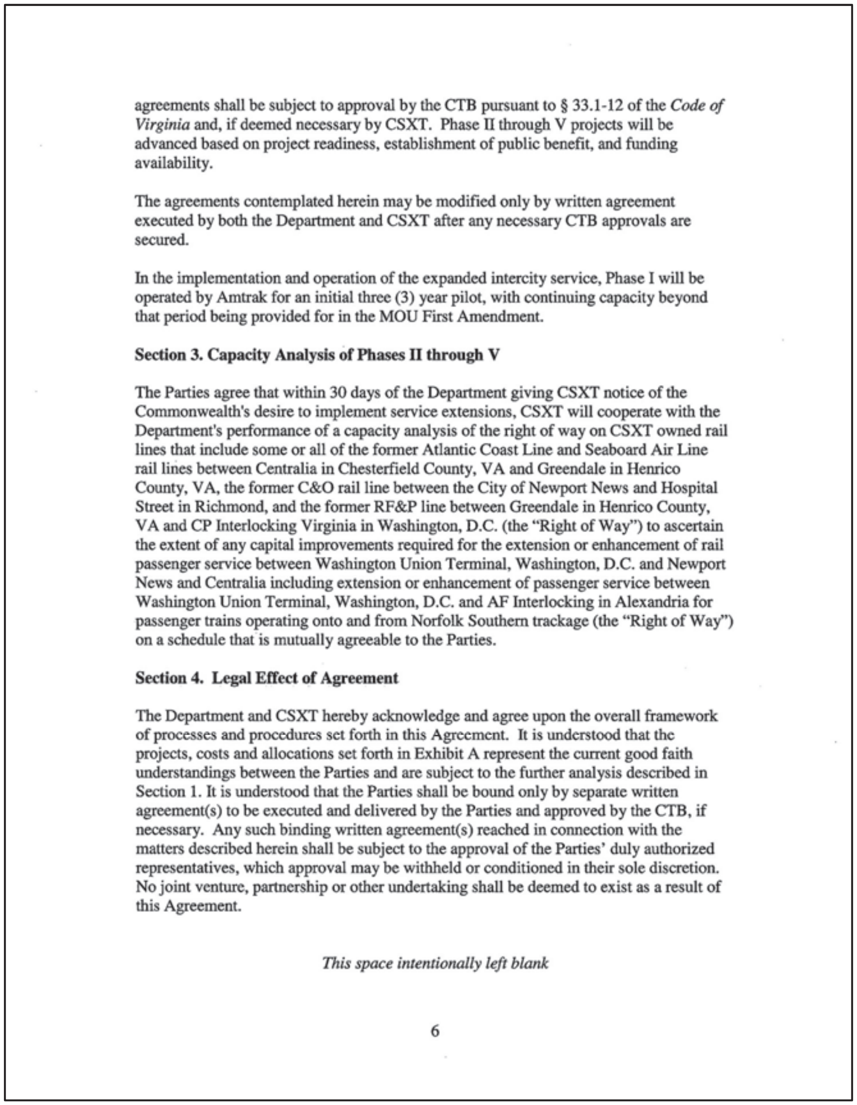
(c) The obligations of the Parties for the projects within a Phase listed on Exhibit C are contingent upon (i) the appropriation by the General Assembly and the allocation by the CTB of funding sufficient to cover the Department's share of the projects listed in that Phase, and, (ii) the approval of CSXT. Once these contingencies have been satisfied, the Parties will execute the necessary and agreed upon funding and implementing agreements.

(d) If CSXT begins to fund and/or implement any project within a Phase listed on Exhibit A or C and the Department matching funds are not available because the funding source is deemed unconstitutional or for any other reason beyond the reasonable control of CSXT, then the Department shall with all practical dispatch consistent in all respects with applicable law and its obligations under this Agreement (i) immediately deliver to the Department of Planning and Budget of the Commonwealth of Virginia a provision that there be appropriated such amounts necessary to fund Department's commitments under this Agreement from any legally available funds, (ii) use its best efforts to have (A) the Governor include, in each biennial or any supplemental budget the Governor presents to the General Assembly, the amounts necessary to fund Department's commitments under this Agreement, (B) the General Assembly appropriate and re-appropriate, as applicable, such amounts to or on behalf of the Department for the purpose of funding its commitments under this Agreement, and (C) the CTB allocate such appropriated amounts for the purpose of funding Department's commitments under this Agreement. If these efforts are unsuccessful and Department's funding commitments under this Agreement remain unfulfilled, CSXT reserves the right to seek relief.

Section 2. Additional Agreements

The Department and CSXT will incorporate all of the Phase I through V projects resulting from this Agreement into grant agreements as funding becomes available. These

CSXT (continued)



agreements shall be subject to approval by the CTB pursuant to § 33.1-12 of the *Code of Virginia* and, if deemed necessary by CSXT. Phase II through V projects will be advanced based on project readiness, establishment of public benefit, and funding availability.

The agreements contemplated herein may be modified only by written agreement executed by both the Department and CSXT after any necessary CTB approvals are secured.

In the implementation and operation of the expanded intercity service, Phase I will be operated by Amtrak for an initial three (3) year pilot, with continuing capacity beyond that period being provided for in the MOU First Amendment.

Section 3. Capacity Analysis of Phases II through V

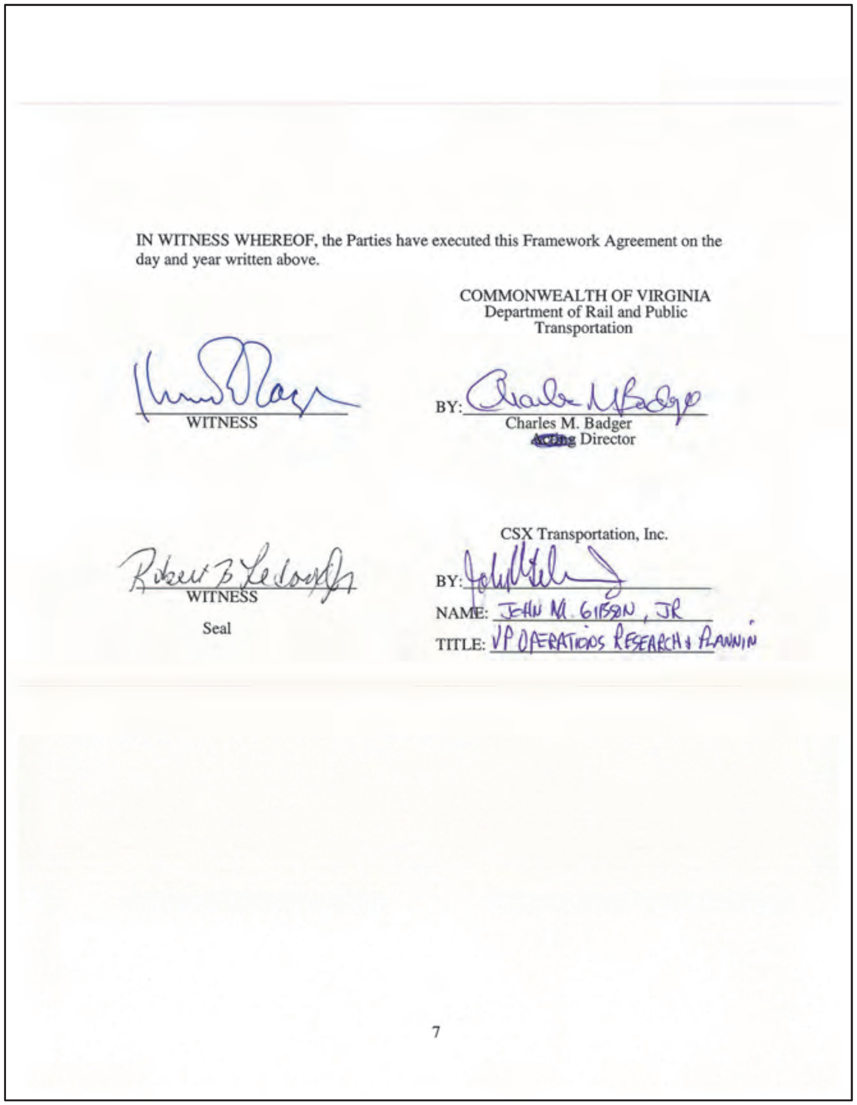
The Parties agree that within 30 days of the Department giving CSXT notice of the Commonwealth's desire to implement service extensions, CSXT will cooperate with the Department's performance of a capacity analysis of the right of way on CSXT owned rail lines that include some or all of the former Atlantic Coast Line and Seaboard Air Line rail lines between Centralia in Chesterfield County, VA and Greendale in Henrico County, VA, the former C&O rail line between the City of Newport News and Hospital Street in Richmond, and the former RF&P line between Greendale in Henrico County, VA and CP Interlocking Virginia in Washington, D.C. (the "Right of Way") to ascertain the extent of any capital improvements required for the extension or enhancement of rail passenger service between Washington Union Terminal, Washington, D.C. and Newport News and Centralia including extension or enhancement of passenger service between Washington Union Terminal, Washington, D.C. and AF Interlocking in Alexandria for passenger trains operating onto and from Norfolk Southern trackage (the "Right of Way") on a schedule that is mutually agreeable to the Parties.

Section 4. Legal Effect of Agreement

The Department and CSXT hereby acknowledge and agree upon the overall framework of processes and procedures set forth in this Agreement. It is understood that the projects, costs and allocations set forth in Exhibit A represent the current good faith understandings between the Parties and are subject to the further analysis described in Section 1. It is understood that the Parties shall be bound only by separate written agreement(s) to be executed and delivered by the Parties and approved by the CTB, if necessary. Any such binding written agreement(s) reached in connection with the matters described herein shall be subject to the approval of the Parties' duly authorized representatives, which approval may be withheld or conditioned in their sole discretion. No joint venture, partnership or other undertaking shall be deemed to exist as a result of this Agreement.

This space intentionally left blank

CSXT (continued)



IN WITNESS WHEREOF, the Parties have executed this Framework Agreement on the day and year written above.

Improvement and Service Enhancement Schedule

CSXT (continued)

Exhibit B
Passenger and Freight Rail Improvement Infrastructure Projects Improvement and Service Enhancement Schedule

CSXT (continued)

Exhibit C
Passenger and Freight Rail Improvement Infrastructure Projects Improvement and Service Enhancement Schedule

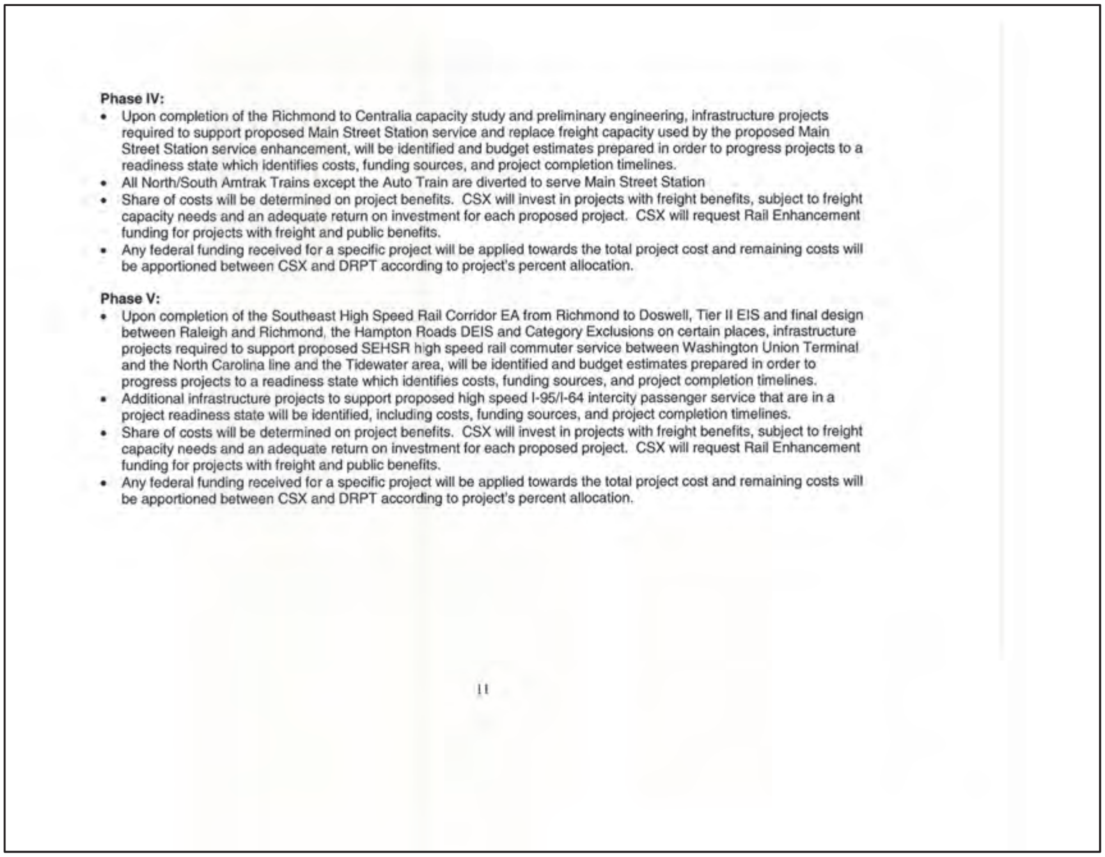
Phase II:

- Upon completion of the Fredericksburg to Richmond and Newport News capacity study and preliminary engineering projects (funded as part of Phase I), infrastructure projects required to support proposed Amtrak passenger service to Richmond Main Street Station and potentially Newport News and replace freight capacity used by proposed passenger service to Richmond Main Street Station and potentially Newport News will be identified and budget estimates prepared in order to progress projects to a readiness state which identifies costs, funding sources, and project completion timelines.
- Additional infrastructure projects to support proposed I-95 freight service that are in a project readiness state will be identified, including costs, funding sources, and project completion timelines.
- Share of costs will be determined on project benefits. CSX will invest in projects with freight benefits, subject to freight capacity needs and an adequate return on investment for each proposed project. CSX will request Rail Enhancement funding for projects with freight and public benefits.
- Any federal funding received for a specific project will be applied towards the total project cost and remaining costs will be apportioned between CSX and DRPT according to project's percent allocation.

Phase III:

- Upon completion of the Fredericksburg to Washington, D.C. capacity study and preliminary engineering (funded to the Virginia Railway Express (VRE) part of a Commuter Rail project), infrastructure projects required to support proposed VRE commuter service between Washington Union Terminal and AF Interlocking for Manassas and Gainesville or Haymarket service and replace freight capacity used by the proposed VRE service enhancement, will be identified and budget estimates prepared in order to progress projects to a readiness state which identifies costs, funding sources, and project completion timelines.
- Additional infrastructure projects to support proposed I-95/I-64 intercity passenger service that are in a project readiness state will be identified, including costs, funding sources, and project completion timelines.
- Share of costs will be determined on project benefits. CSXT will invest in projects with freight benefits, subject to freight capacity needs and an adequate return on investment for each proposed project. CSXT will request Rail Enhancement funding for projects with freight and public benefits.
- Any federal funding received for a specific project will be applied towards the total project cost and remaining costs will be apportioned between CSXT and DRPT according to project's percent allocation.

CSXT (continued)



Phase IV:

- Upon completion of the Richmond to Centralia capacity study and preliminary engineering, infrastructure projects required to support proposed Main Street Station service and replace freight capacity used by the proposed Main Street Station service enhancement, will be identified and budget estimates prepared in order to progress projects to a readiness state which identifies costs, funding sources, and project completion timelines.
- All North/South Amtrak Trains except the Auto Train are diverted to serve Main Street Station
- Share of costs will be determined on project benefits. CSX will invest in projects with freight benefits, subject to freight capacity needs and an adequate return on investment for each proposed project. CSX will request Rail Enhancement funding for projects with freight and public benefits.
- Any federal funding received for a specific project will be applied towards the total project cost and remaining costs will be apportioned between CSX and DRPT according to project's percent allocation.

Phase V:

- Upon completion of the Southeast High Speed Rail Corridor EA from Richmond to Doswell, Tier II EIS and final design between Raleigh and Richmond, the Hampton Roads DEIS and Category Exclusions on certain places, infrastructure projects required to support proposed SEHSR high speed rail commuter service between Washington Union Terminal and the North Carolina line and the Tidewater area, will be identified and budget estimates prepared in order to progress projects to a readiness state which identifies costs, funding sources, and project completion timelines.
- Additional infrastructure projects to support proposed high speed I-95/I-64 intercity passenger service that are in a project readiness state will be identified, including costs, funding sources, and project completion timelines.
- Share of costs will be determined on project benefits. CSX will invest in projects with freight benefits, subject to freight capacity needs and an adequate return on investment for each proposed project. CSX will request Rail Enhancement funding for projects with freight and public benefits.
- Any federal funding received for a specific project will be applied towards the total project cost and remaining costs will be apportioned between CSX and DRPT according to project's percent allocation.

CSXT (continued)

NON-BINDING TERM SHEET

between

VIRGINIA DEPARTMENT OF RAIL AND PUBLIC TRANSPORTATION

and

CSX TRANSPORTATION, INC.

April 11, 2016

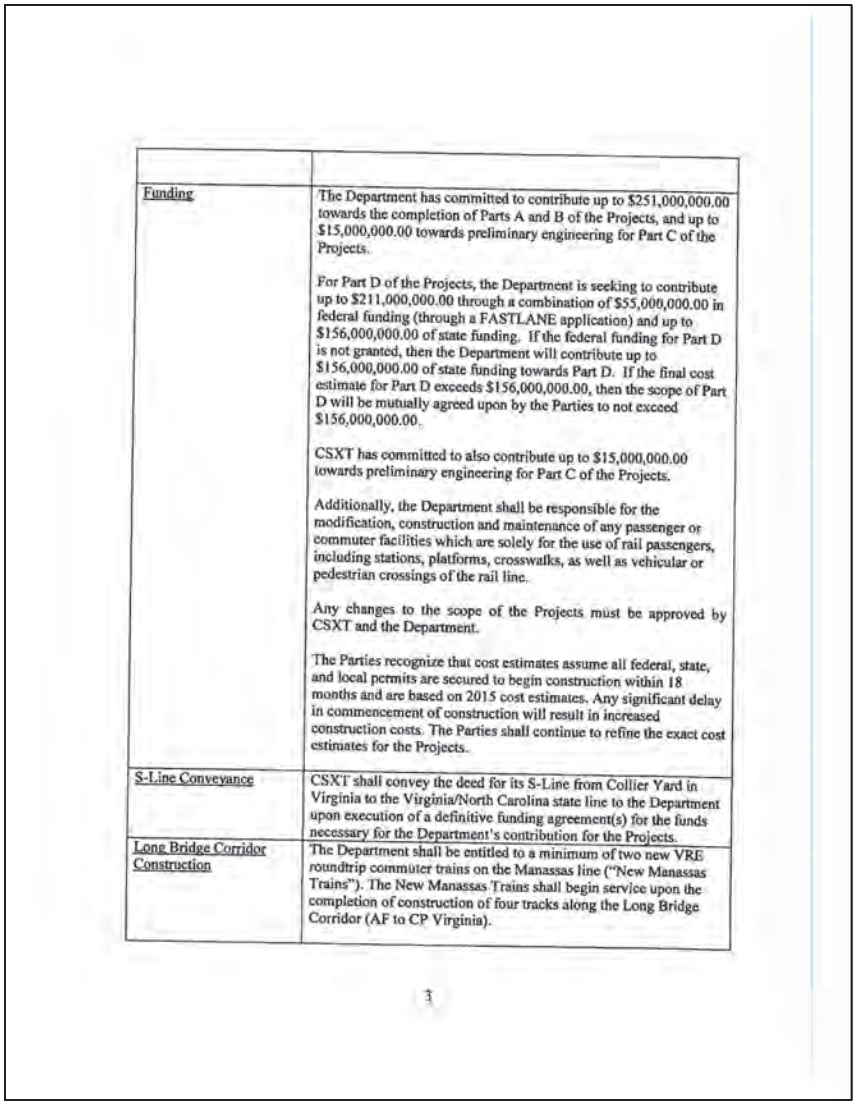
This Non-Binding Term Sheet ("Term Sheet") is intended to be an aid to negotiation only with respect to a proposal by the Virginia Department of Rail and Public Transportation ("Department") to provide for certain initial short term fast track infrastructure improvements on the CSX Transportation, Inc. ("CSXT") (each also individually referred to as a "Party" and collectively as the "Parties") rail corridor in Virginia for the purpose of improving the overall fluidity of CSXT's co-mingled freight and passenger rail use network and to enable the extension and commencement of new Virginia Railway Express ("VRE") roundtrip commuter trains over certain rail sections to serve markets on and off of CSXT. Longer term infrastructure improvements on CSXT's Washington, D.C. to Richmond rail corridor, under enhanced capacity development, include CSXT's proposed advancement of Third Main Line project sections (further defined below) between Crossroads (Spotsylvania) and Virginia Avenue Interlocking (Washington, DC) and the transfer of CSXT's S-Line corridor to the Commonwealth. It is not meant to be binding on any party, in whole or in part, now or in the future, except for the Termination provisions, which shall be binding. It is intended as a summary only of the principal elements of the transaction, all of which are subject to the negotiation, execution and delivery of definitive funding and construction agreement(s) (the "Agreement(s)").

Background of Relationship and Partnership	The Parties have a long and successful history of partnership on capital projects that have improved the CSXT rail network in Virginia which has allowed for enhancements to both freight and passenger rail service in Virginia. A guiding principle in previous project efforts has been that new passenger rail service was not started before the infrastructure required to support the increased train counts was constructed.
Project Delivery	The Department shall be entitled to two new VRE roundtrip commuter trains, one on the Manassas line ("New Manassas Train") and one on the Fredericksburg line ("New Fredericksburg Train"). The New Manassas Train and New Fredericksburg Train shall

CSXT (continued)

	begin service upon the completion of construction of Parts A and B of the Projects, and completion of Part E of the Projects. Such new service shall be operated under terms and conditions set forth in an operating agreement, including mutually agreeable schedules, between CSXT and the VRE. The Parties will work together to temporarily adjust the schedules to include additional run-time for any existing passenger trains (including Amtrak intercity and VRE commuter trains) which might be impacted by the construction on the Projects. At the conclusion of construction, schedules will revert to pre-construction run-times.
Projects	The infrastructure projects on CSXT's network ("Projects") shall be the design, permitting and construction, including procurement of materials, of the following: 1. 8 miles of third main between CFP 90.0 and CFP 98.0 in Virginia ("Part A"), and 2. 2 universal crossovers between Fredericksburg and Richmond, Virginia, the exact location of which shall be determined by CSXT, with the consultation of the Department ("Part B"), and 3. Preliminary engineering work on Long Bridge, as mutually agreed to by the Parties ("Part C"), and 4. 6 miles of fourth main from AF to RO ("Part D"), and 5. Review and adjustment of Amtrak permanent scheduled run-times ("Part E") CSXT's cost share includes all future maintenance on such new rail infrastructure after construction. Prior to construction, the Parties will review historical run-times and adjust permanent scheduled run-times to seek 85% or better on-time performance with a 95% confidence level among CSXT, VRE, the Department, and the National Railroad Passenger Corporation ("Amtrak") for the state sponsored Amtrak trains operated between Richmond, Virginia and the District of Columbia. After construction is completed, schedules for the state sponsored Amtrak trains will be reviewed and adjusted (Part E) using this same process as the corridor evolves (changes in infrastructure or freight volume) to maintain 85% or better on-time performance with a 95% confidence level.

CSXT (continued)



Funding	The Department has committed to contribute up to $251,000,000.00 towards the completion of Parts A and B of the Projects, and up to $15,000,000.00 towards preliminary engineering for Part C of the Projects. For Part D of the Projects, the Department is seeking to contribute up to $211,000,000.00 through a combination of $55,000,000.00 in federal funding (through a FASTLANE application) and up to $156,000,000.00 of state funding. If the federal funding for Part D is not granted, then the Department will contribute up to $156,000,000.00 of state funding towards Part D. If the final cost estimate for Part D exceeds $156,000,000.00, then the scope of Part D will be mutually agreed upon by the Parties to not exceed $156,000,000.00. CSXT has committed to also contribute up to $15,000,000.00 towards preliminary engineering for Part C of the Projects. Additionally, the Department shall be responsible for the modification, construction and maintenance of any passenger or commuter facilities which are solely for the use of rail passengers, including stations, platforms, crosswalks, as well as vehicular or pedestrian crossings of the rail line. Any changes to the scope of the Projects must be approved by CSXT and the Department. The Parties recognize that cost estimates assume all federal, state, and local permits are secured to begin construction within 18 months and are based on 2015 cost estimates. Any significant delay in commencement of construction will result in increased construction costs. The Parties shall continue to refine the exact cost estimates for the Projects.
S-Line Conveyance	CSXT shall convey the deed for its S-Line from Collier Yard in Virginia to the Virginia/North Carolina state line to the Department upon execution of a definitive funding agreement(s) for the funds necessary for the Department's contribution for the Projects.
Long Bridge Corridor Construction	The Department shall be entitled to a minimum of two new VRE roundtrip commuter trains on the Manassas line ("New Manassas Trains"). The New Manassas Trains shall begin service upon the completion of construction of four tracks along the Long Bridge Corridor (AF to CP Virginia).

3

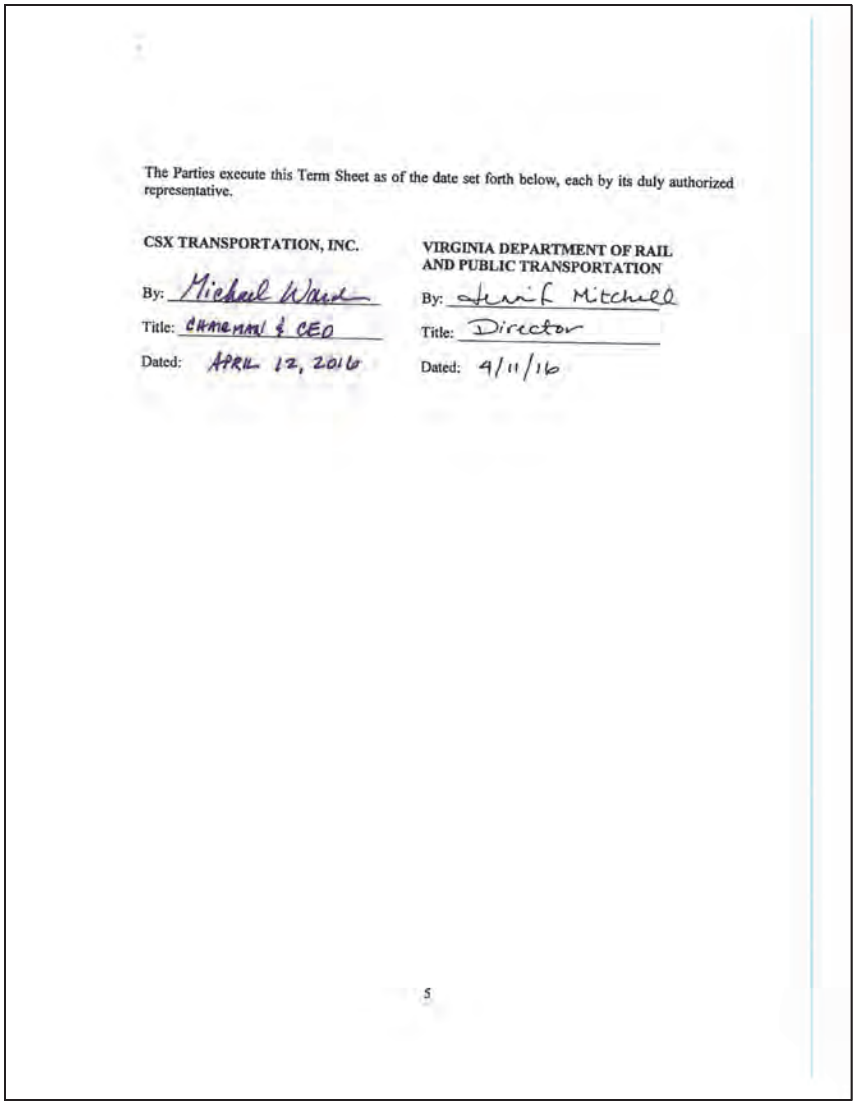
CSXT (continued)

	Such new service shall be operated under terms and conditions set forth in an operating agreement, including mutually agreeable schedules, between CSXT and the VRE.
Preparation of the Agreement(s)	The Parties will use all commercially reasonable efforts to enter into the Agreement(s) for the Projects on or before October 1, 2016.
Third Main Commitment	The Parties will continue discussions about the remaining projects necessary to complete the design and construction of a fully interoperable third mainline track from MP CFP 53.2 (XR) (also referred to as Crossroads) and MP CFP 112.3 (Virginia Avenue Interlocking) (also referred to as CP Virginia). The parties recognize that the completion of the Projects and the Third Main will enhance the capacity and utility of this irreplaceable CSXT corridor in the national rail network. The parties will continue to address the timely completion of all elements of the Third Main; and, following completion, the relative uses by and contributions to the involved CSXT lines for VRE, Amtrak and CSXT purposes into the future.
Maximum Authorized Speeds	The Department agrees that the maximum authorized speed on CSXT's RF&P corridor shall continue to be 70 miles per hour.
Service Outcome Agreement	The Department understands and agrees that CSXT shall not be required or obligated to sign or execute any service outcome agreement, or any similar agreement.
Binding Effect	This Term Sheet shall be effective upon execution by both parties ("Execution Date"). However, nothing in this Term Sheet shall be understood or construed to be binding upon the Parties except for the Termination provision, which shall be binding from the Execution Date and until the date of termination.
Termination	Either Party may in its sole discretion terminate this Term Sheet upon 30 days notice. The Term Sheet may also be terminated at any time by mutual agreement of the Parties. This Termination provision is intended to be binding.
Counterparts	This Term Sheet may be executed in any number of counterparts, including counterparts transmitted by facsimile or electronic transmission, each of which shall be an original as against any party whose signature appears thereon.

[Signatures appear on the following page.]

4

CSXT (continued)



The Parties execute this Term Sheet as of the date set forth below, each by its duly authorized representative.

Executive Summary

Background

Cambridge Systematics, Inc. (CS) and Willard Keeney (the CS team) conducted a technical review and analysis of the Tier II Draft Environmental Impact Statement (DEIS) for the proposed improvements on the 123-mile Washington, DC to Richmond, VA Corridor for Expanded Passenger Rail Service (DC2RVA) in support of the preparation of CSXT's comments. The improvements are intended to accommodate a proposed increase in the volume and speeds of intercity passenger trains operating over the corridor, while insuring an adequate level of service for all corridor users. The purpose of this Technical Review is to examine how impacts to freight and the environment are addressed in the DEIS, whether there is any overstatement and/or understatement of such impacts, and whether there are any technical deficiencies that may materially influence the justifications for the Recommended Preferred Alternative.

This memorandum describes the findings of the CS team's review of two key areas:

1. **Freight traffic forecasts and related matters**, which may impact future use of the DC2RVA corridor, for the full range of freight trains, from through trains to locals serving on-line industries. The capacity needs for through traffic can differ considerably from traffic associated with on-line industry.

2. **Capacity and operations analysis**, or how the Recommended Preferred Alternative is expected to function with the projected freight and passenger train volumes. We examined the capacity modeling that was conducted for the DEIS using Rail Traffic Controller (RTC), including model inputs, assumptions, and the results.

Findings

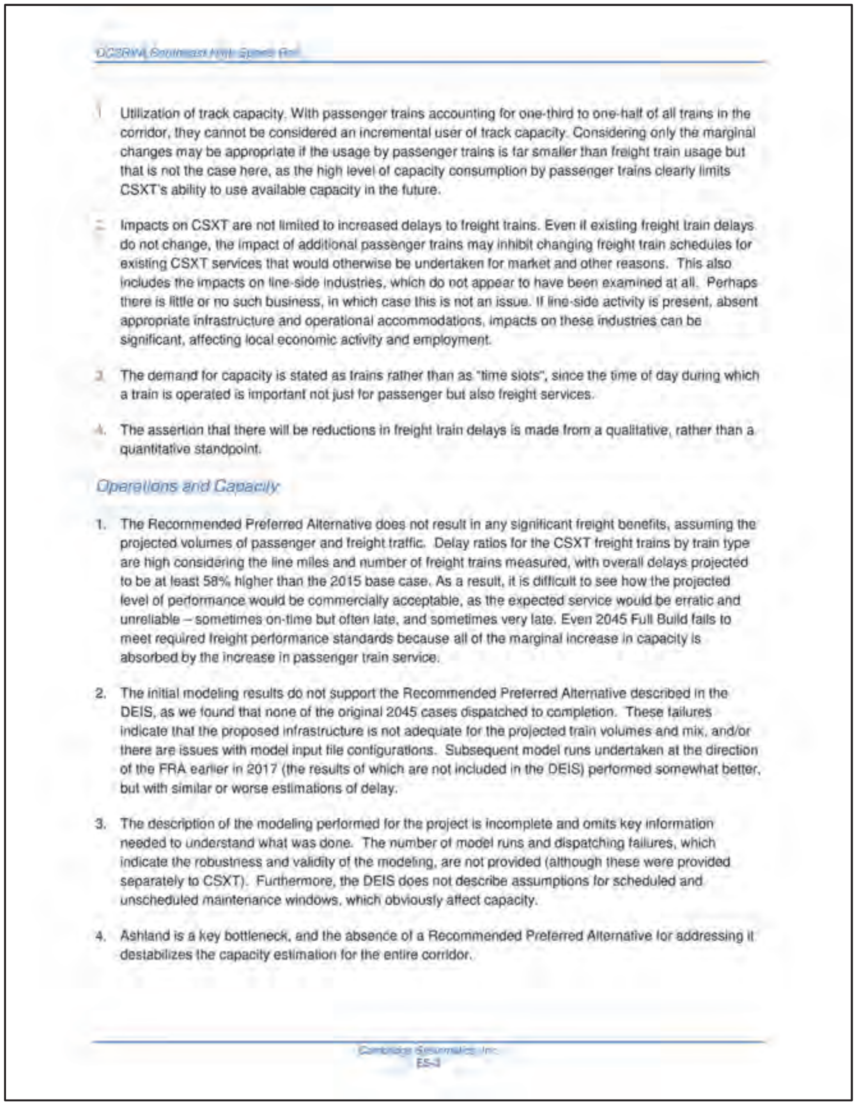
Overall, we found that the DEIS is consistent with FRA requirements, following current practice in a capable manner. However, we did find major weaknesses with the capacity analysis, and more generally the handling of freight related impacts and issues. Most importantly, the results of the capacity modeling indicate that the proposed infrastructure improvements are not sufficient to ensure reliable operation for the projected train schedules. Extended running times and train delays in excess of current conditions fall on CSXT's freight traffic. Furthermore, the modeling itself does not follow best practices, producing potentially misleading results. Since capacity needs and impacts are central to the proposed rail service program and associated infrastructure investments, it is imperative that this aspect of the DEIS be done in a rigorous and sound manner.

The sections that follow summarize our findings and key areas of concern regarding the freight forecasts and the capacity and operations analysis.

Freight Traffic Projections and Related Matters

Although there are no obvious issues with the material concerning freight traffic projections, there are a number of concerns with the presentation of freight-related information and omissions. These include the following:

CSXT (continued)

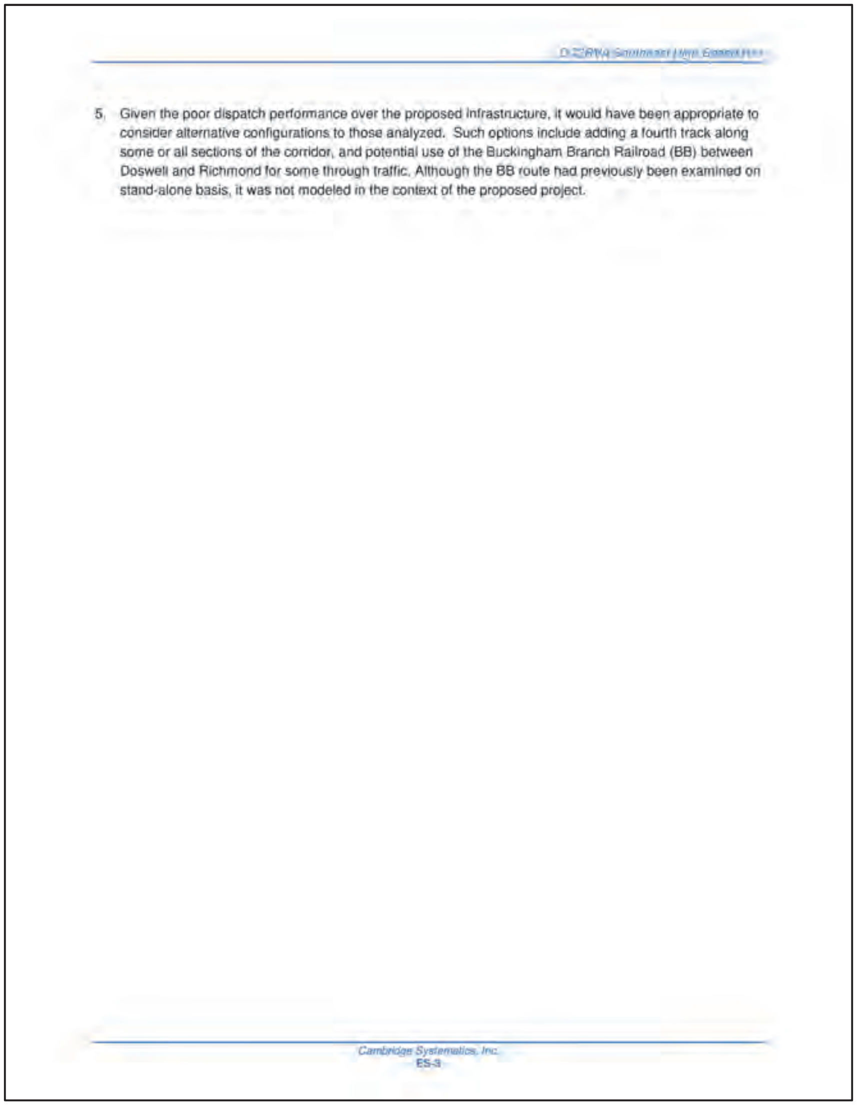


1. Utilization of track capacity. With passenger trains accounting for one-third to one-half of all trains in the corridor, they cannot be considered an incremental user of track capacity. Considering only the marginal changes may be appropriate if the usage by passenger trains is far smaller than freight train usage but that is not the case here, as the high level of capacity consumption by passenger trains clearly limits CSXT's ability to use available capacity in the future.
2. Impacts on CSXT are not limited to increased delays to freight trains. Even if existing freight train delays do not change, the impact of additional passenger trains may inhibit changing freight train schedules for existing CSXT services that would otherwise be undertaken for market and other reasons. This also includes the impacts on line-side industries, which do not appear to have been examined at all. Perhaps there is little or no such business, in which case this is not an issue. If line-side activity is present, absent appropriate infrastructure and operational accommodations, impacts on these industries can be significant, affecting local economic activity and employment.
3. The demand for capacity is stated as trains rather than as "time slots", since the time of day during which a train is operated is important not just for passenger but also freight services.
4. The assertion that there will be reductions in freight train delays is made from a qualitative, rather than a quantitative standpoint.

Operations and Capacity

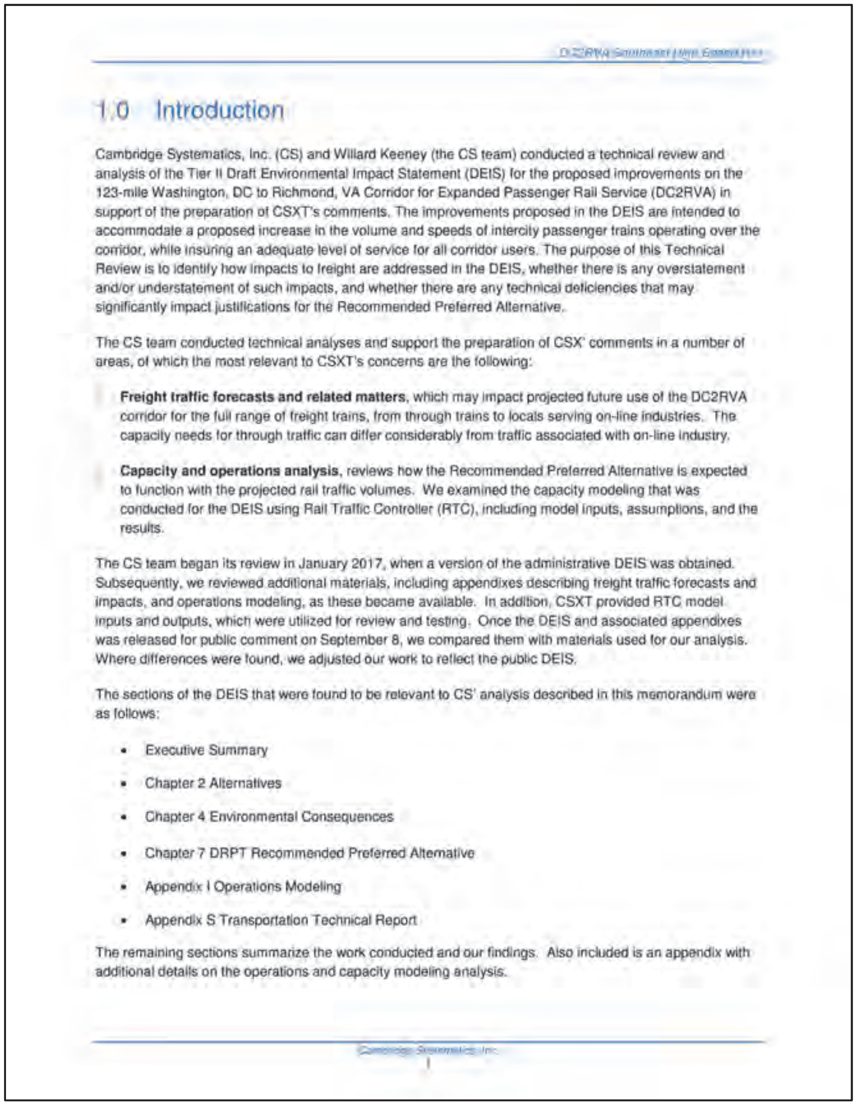
1. The Recommended Preferred Alternative does not result in any significant freight benefits, assuming the projected volumes of passenger and freight traffic. Delay ratios for the CSXT freight trains by train type are high considering the line miles and number of freight trains measured, with overall delays projected to be at least 58% higher than the 2015 base case. As a result, it is difficult to see how the projected level of performance would be commercially acceptable, as the expected service would be erratic and unreliable – sometimes on-time but often late, and sometimes very late. Even 2045 Full Build fails to meet required freight performance standards because all of the marginal increase in capacity is absorbed by the increase in passenger train service.
2. The initial modeling results do not support the Recommended Preferred Alternative described in the DEIS, as we found that none of the original 2045 cases dispatched to completion. These failures indicate that the proposed infrastructure is not adequate for the projected train volumes and mix, and/or there are issues with model input file configurations. Subsequent model runs undertaken at the direction of the FRA earlier in 2017 (the results of which are not included in the DEIS) performed somewhat better, but with similar or worse estimations of delay.
3. The description of the modeling performed for the project is incomplete and omits key information needed to understand what was done. The number of model runs and dispatching failures, which indicate the robustness and validity of the modeling, are not provided (although these were provided separately to CSXT). Furthermore, the DEIS does not describe assumptions for scheduled and unscheduled maintenance windows, which obviously affect capacity.
4. Ashland is a key bottleneck, and the absence of a Recommended Preferred Alternative for addressing it destabilizes the capacity estimation for the entire corridor.

CSXT (continued)



5. Given the poor dispatch performance over the proposed infrastructure, it would have been appropriate to consider alternative configurations to those analyzed. Such options include adding a fourth track along some or all sections of the corridor, and potential use of the Buckingham Branch Railroad (BB) between Doswell and Richmond for some through traffic. Although the BB route had previously been examined on stand-alone basis, it was not modeled in the context of the proposed project.

CSXT (continued)



1.0 Introduction

Cambridge Systematics, Inc. (CS) and Willard Keeney (the CS team) conducted a technical review and analysis of the Tier II Draft Environmental Impact Statement (DEIS) for the proposed improvements on the 123-mile Washington, DC to Richmond, VA Corridor for Expanded Passenger Rail Service (DC2RVA) in support of the preparation of CSXT's comments. The improvements proposed in the DEIS are intended to accommodate a proposed increase in the volume and speeds of intercity passenger trains operating over the corridor, while insuring an adequate level of service for all corridor users. The purpose of this Technical Review is to identify how impacts to freight are addressed in the DEIS, whether there is any overstatement and/or understatement of such impacts, and whether there are any technical deficiencies that may significantly impact justifications for the Recommended Preferred Alternative.

The CS team conducted technical analyses and support the preparation of CSX' comments in a number of areas, of which the most relevant to CSXT's concerns are the following:

- **Freight traffic forecasts and related matters**, which may impact projected future use of the DC2RVA corridor for the full range of freight trains, from through trains to locals serving on-line industries. The capacity needs for through traffic can differ considerably from traffic associated with on-line industry.
- **Capacity and operations analysis**, reviews how the Recommended Preferred Alternative is expected to function with the projected rail traffic volumes. We examined the capacity modeling that was conducted for the DEIS using Rail Traffic Controller (RTC), including model inputs, assumptions, and the results.

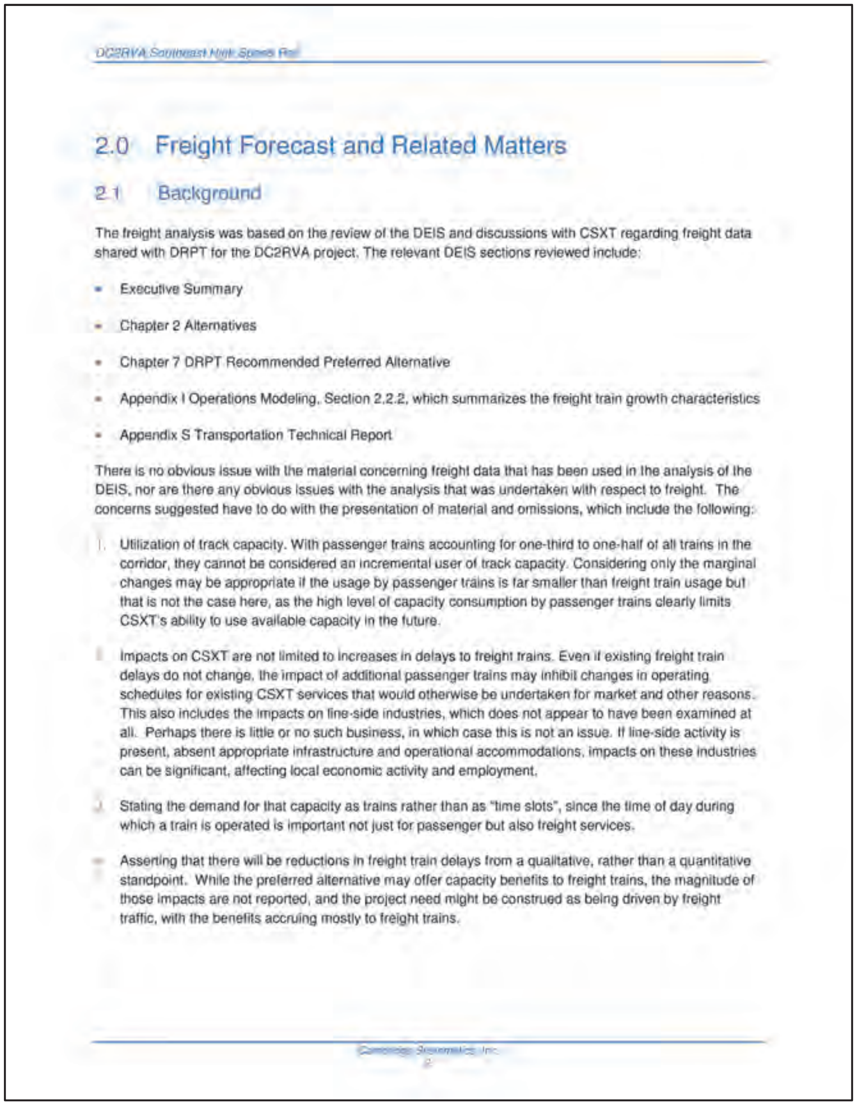
The CS team began its review in January 2017, when a version of the administrative DEIS was obtained. Subsequently, we reviewed additional materials, including appendixes describing freight traffic forecasts and impacts, and operations modeling, as these became available. In addition, CSXT provided RTC model inputs and outputs, which were utilized for review and testing. Once the DEIS and associated appendixes was released for public comment on September 8, we compared them with materials used for our analysis. Where differences were found, we adjusted our work to reflect the public DEIS.

The sections of the DEIS that were found to be relevant to CS' analysis described in this memorandum were as follows:

- Executive Summary
- Chapter 2 Alternatives
- Chapter 4 Environmental Consequences
- Chapter 7 DRPT Recommended Preferred Alternative
- Appendix I Operations Modeling
- Appendix S Transportation Technical Report

The remaining sections summarize the work conducted and our findings. Also included is an appendix with additional details on the operations and capacity modeling analysis.

CSXT (continued)



2.0 Freight Forecast and Related Matters

2.1 Background

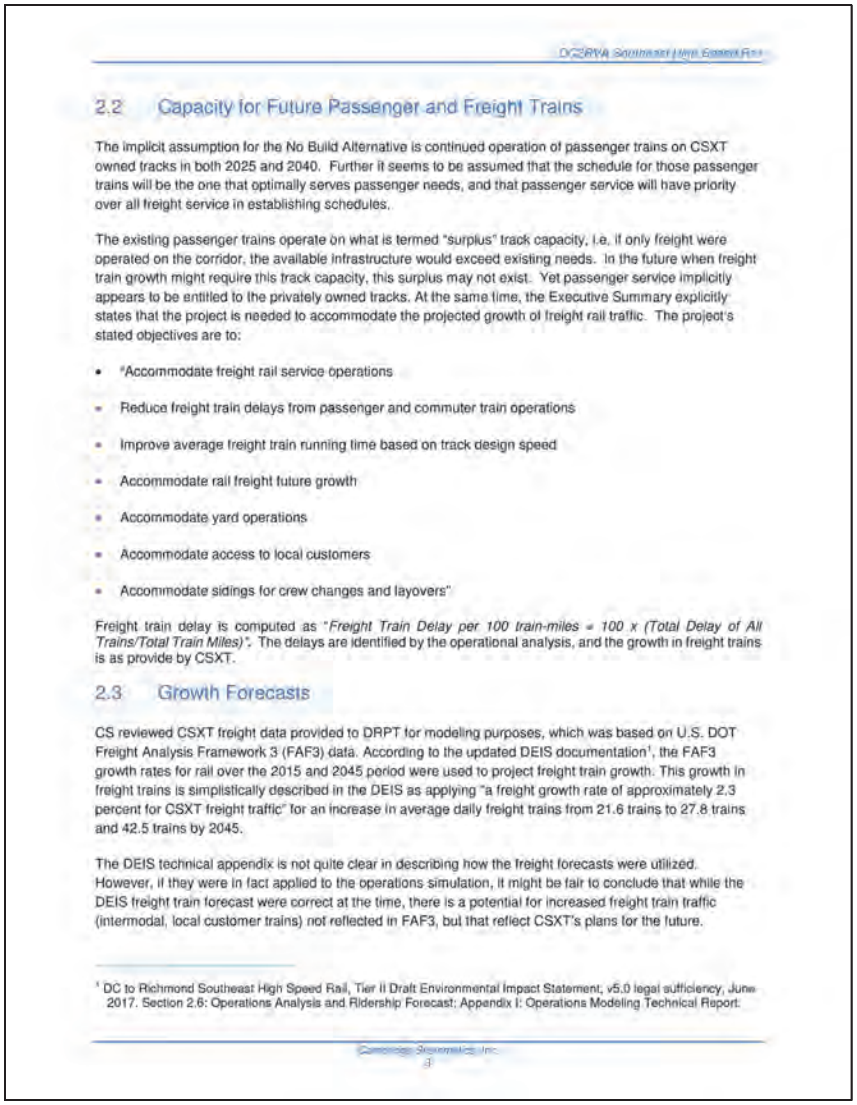
The freight analysis was based on the review of the DEIS and discussions with CSXT regarding freight data shared with DRPT for the DC2RVA project. The relevant DEIS sections reviewed include:

- Executive Summary
- Chapter 2 Alternatives
- Chapter 7 DRPT Recommended Preferred Alternative
- Appendix I Operations Modeling, Section 2.2.2, which summarizes the freight train growth characteristics
- Appendix S Transportation Technical Report

There is no obvious issue with the material concerning freight data that has been used in the analysis of the DEIS, nor are there any obvious issues with the analysis that was undertaken with respect to freight. The concerns suggested have to do with the presentation of material and omissions, which include the following:

1. Utilization of track capacity. With passenger trains accounting for one-third to one-half of all trains in the corridor, they cannot be considered an incremental user of track capacity. Considering only the marginal changes may be appropriate if the usage by passenger trains is far smaller than freight train usage but that is not the case here, as the high level of capacity consumption by passenger trains clearly limits CSXT's ability to use available capacity in the future.
2. Impacts on CSXT are not limited to increases in delays to freight trains. Even if existing freight train delays do not change, the impact of additional passenger trains may inhibit changes in operating schedules for existing CSXT services that would otherwise be undertaken for market and other reasons. This also includes the impacts on line-side industries, which does not appear to have been examined at all. Perhaps there is little or no such business, in which case this is not an issue. If line-side activity is present, absent appropriate infrastructure and operational accommodations, impacts on these industries can be significant, affecting local economic activity and employment.
3. Stating the demand for that capacity as trains rather than as "time slots", since the time of day during which a train is operated is important not just for passenger but also freight services.
4. Asserting that there will be reductions in freight train delays from a qualitative, rather than a quantitative standpoint. While the preferred alternative may offer capacity benefits to freight trains, the magnitude of those impacts are not reported, and the project need might be construed as being driven by freight traffic, with the benefits accruing mostly to freight trains.

CSXT (continued)



2.2 Capacity for Future Passenger and Freight Trains

The implicit assumption for the No Build Alternative is continued operation of passenger trains on CSXT owned tracks in both 2025 and 2040. Further it seems to be assumed that the schedule for those passenger trains will be the one that optimally serves passenger needs, and that passenger service will have priority over all freight service in establishing schedules.

The existing passenger trains operate on what is termed "surplus" track capacity, i.e. if only freight were operated on the corridor, the available infrastructure would exceed existing needs. In the future when freight train growth might require this track capacity, this surplus may not exist. Yet passenger service implicitly appears to be entitled to the privately owned tracks. At the same time, the Executive Summary explicitly states that the project is needed to accommodate the projected growth of freight rail traffic. The project's stated objectives are to:

- "Accommodate freight rail service operations
- Reduce freight train delays from passenger and commuter train operations
- Improve average freight train running time based on track design speed
- Accommodate rail freight future growth
- Accommodate yard operations
- Accommodate access to local customers
- Accommodate sidings for crew changes and layovers"

Freight train delay is computed as "*Freight Train Delay per 100 train-miles = 100 x (Total Delay of All Trains/Total Train Miles)*". The delays are identified by the operational analysis, and the growth in freight trains is as provide by CSXT.

2.3 Growth Forecasts

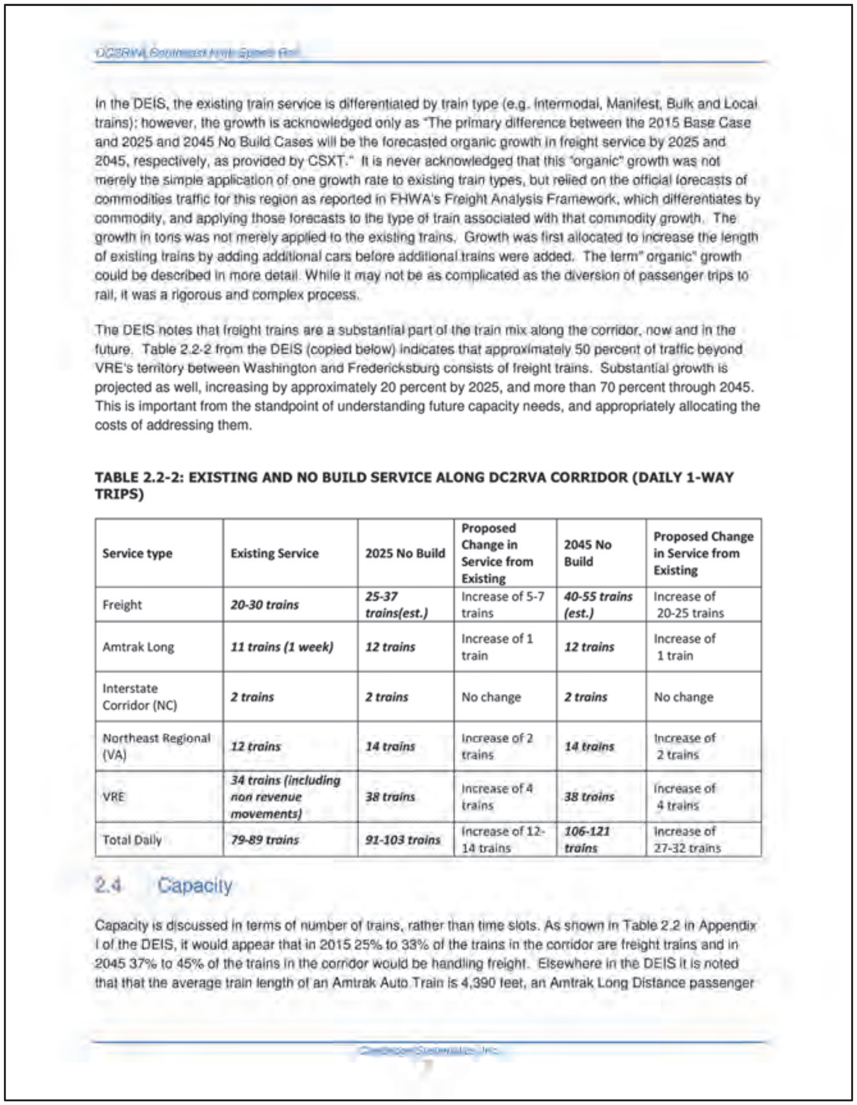
CS reviewed CSXT freight data provided to DRPT for modeling purposes, which was based on U.S. DOT Freight Analysis Framework 3 (FAF3) data. According to the updated DEIS documentation[1], the FAF3 growth rates for rail over the 2015 and 2045 period were used to project freight train growth. This growth in freight trains is simplistically described in the DEIS as applying "a freight growth rate of approximately 2.3 percent for CSXT freight traffic" for an increase in average daily freight trains from 21.6 trains to 27.8 trains and 42.5 trains by 2045.

The DEIS technical appendix is not quite clear in describing how the freight forecasts were utilized. However, if they were in fact applied to the operations simulation, it might be fair to conclude that while the DEIS freight train forecast were correct at the time, there is a potential for increased freight train traffic (intermodal, local customer trains) not reflected in FAF3, but that reflect CSXT's plans for the future.

---

[1] DC to Richmond Southeast High Speed Rail, Tier II Draft Environmental Impact Statement; v5.0 legal sufficiency, June 2017. Section 2.6: Operations Analysis and Ridership Forecast; Appendix I: Operations Modeling Technical Report.

CSXT (continued)



In the DEIS, the existing train service is differentiated by train type (e.g. Intermodal, Manifest, Bulk and Local trains); however, the growth is acknowledged only as "The primary difference between the 2015 Base Case and 2025 and 2045 No Build Cases will be the forecasted organic growth in freight service by 2025 and 2045, respectively, as provided by CSXT." It is never acknowledged that this "organic" growth was not merely the simple application of one growth rate to existing train types, but relied on the official forecasts of commodities traffic for this region as reported in FHWA's Freight Analysis Framework, which differentiates by commodity, and applying those forecasts to the type of train associated with that commodity growth. The growth in tons was not merely applied to the existing trains. Growth was first allocated to increase the length of existing trains by adding additional cars before additional trains were added. The term" organic" growth could be described in more detail. While it may not be as complicated as the diversion of passenger trips to rail, it was a rigorous and complex process.

The DEIS notes that freight trains are a substantial part of the train mix along the corridor, now and in the future. Table 2.2-2 from the DEIS (copied below) indicates that approximately 50 percent of traffic beyond VRE's territory between Washington and Fredericksburg consists of freight trains. Substantial growth is projected as well, increasing by approximately 20 percent by 2025, and more than 70 percent through 2045. This is important from the standpoint of understanding future capacity needs, and appropriately allocating the costs of addressing them.

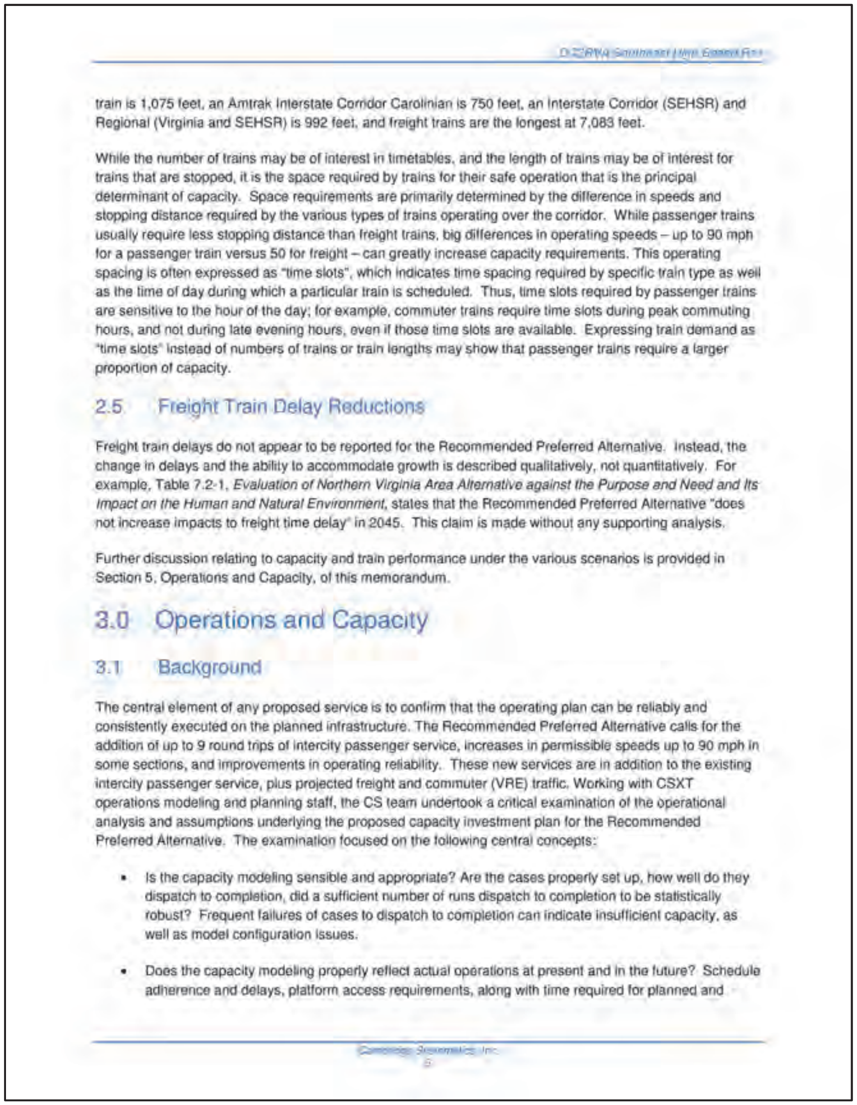
TABLE 2.2-2: EXISTING AND NO BUILD SERVICE ALONG DC2RVA CORRIDOR (DAILY 1-WAY TRIPS)

Service type	Existing Service	2025 No Build	Proposed Change in Service from Existing	2045 No Build	Proposed Change in Service from Existing
Freight	*20-30 trains*	*25-37 trains(est.)*	Increase of 5-7 trains	*40-55 trains (est.)*	Increase of 20-25 trains
Amtrak Long	*11 trains (1 week)*	*12 trains*	Increase of 1 train	*12 trains*	Increase of 1 train
Interstate Corridor (NC)	*2 trains*	*2 trains*	No change	*2 trains*	No change
Northeast Regional (VA)	*12 trains*	*14 trains*	Increase of 2 trains	*14 trains*	Increase of 2 trains
VRE	*34 trains (including non revenue movements)*	*38 trains*	Increase of 4 trains	*38 trains*	Increase of 4 trains
Total Daily	*79-89 trains*	*91-103 trains*	Increase of 12-14 trains	*106-121 trains*	Increase of 27-32 trains

2.4 Capacity

Capacity is discussed in terms of number of trains, rather than time slots. As shown in Table 2.2 in Appendix I of the DEIS, it would appear that in 2015 25% to 33% of the trains in the corridor are freight trains and in 2045 37% to 45% of the trains in the corridor would be handling freight. Elsewhere in the DEIS it is noted that that the average train length of an Amtrak Auto Train is 4,390 feet, an Amtrak Long Distance passenger

CSXT (continued)



train is 1,075 feet, an Amtrak Interstate Corridor Carolinian is 750 feet, an Interstate Corridor (SEHSR) and Regional (Virginia and SEHSR) is 992 feet, and freight trains are the longest at 7,083 feet.

While the number of trains may be of interest in timetables, and the length of trains may be of interest for trains that are stopped, it is the space required by trains for their safe operation that is the principal determinant of capacity. Space requirements are primarily determined by the difference in speeds and stopping distance required by the various types of trains operating over the corridor. While passenger trains usually require less stopping distance than freight trains, big differences in operating speeds – up to 90 mph for a passenger train versus 50 for freight – can greatly increase capacity requirements. This operating spacing is often expressed as "time slots", which indicates time spacing required by specific train type as well as the time of day during which a particular train is scheduled. Thus, time slots required by passenger trains are sensitive to the hour of the day; for example, commuter trains require time slots during peak commuting hours, and not during late evening hours, even if those time slots are available. Expressing train demand as "time slots" instead of numbers of trains or train lengths may show that passenger trains require a larger proportion of capacity.

2.5 Freight Train Delay Reductions

Freight train delays do not appear to be reported for the Recommended Preferred Alternative. Instead, the change in delays and the ability to accommodate growth is described qualitatively, not quantitatively. For example, Table 7.2-1, *Evaluation of Northern Virginia Area Alternative against the Purpose and Need and Its Impact on the Human and Natural Environment*, states that the Recommended Preferred Alternative "does not increase impacts to freight time delay" in 2045. This claim is made without any supporting analysis.

Further discussion relating to capacity and train performance under the various scenarios is provided in Section 5, Operations and Capacity, of this memorandum.

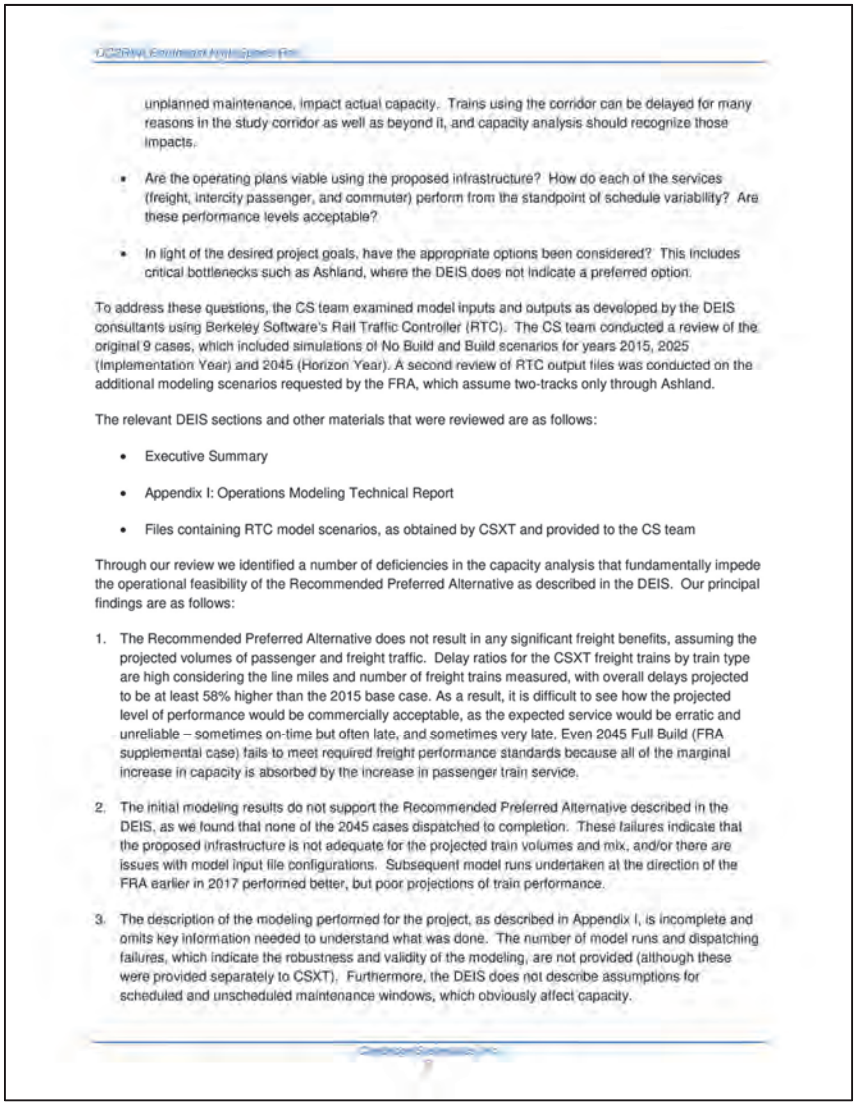
3.0 Operations and Capacity

3.1 Background

The central element of any proposed service is to confirm that the operating plan can be reliably and consistently executed on the planned infrastructure. The Recommended Preferred Alternative calls for the addition of up to 9 round trips of intercity passenger service, increases in permissible speeds up to 90 mph in some sections, and improvements in operating reliability. These new services are in addition to the existing intercity passenger service, plus projected freight and commuter (VRE) traffic. Working with CSXT operations modeling and planning staff, the CS team undertook a critical examination of the operational analysis and assumptions underlying the proposed capacity investment plan for the Recommended Preferred Alternative. The examination focused on the following central concepts:

- Is the capacity modeling sensible and appropriate? Are the cases properly set up, how well do they dispatch to completion, did a sufficient number of runs dispatch to completion to be statistically robust? Frequent failures of cases to dispatch to completion can indicate insufficient capacity, as well as model configuration issues.
- Does the capacity modeling properly reflect actual operations at present and in the future? Schedule adherence and delays, platform access requirements, along with time required for planned and unplanned maintenance, impact actual capacity. Trains using the corridor can be delayed for many reasons in the study corridor as well as beyond it, and capacity analysis should recognize those impacts.

CSXT (continued)



- Are the operating plans viable using the proposed infrastructure? How do each of the services (freight, intercity passenger, and commuter) perform from the standpoint of schedule variability? Are these performance levels acceptable?
- In light of the desired project goals, have the appropriate options been considered? This includes critical bottlenecks such as Ashland, where the DEIS does not indicate a preferred option.

To address these questions, the CS team examined model inputs and outputs as developed by the DEIS consultants using Berkeley Software's Rail Traffic Controller (RTC). The CS team conducted a review of the original 9 cases, which included simulations of No Build and Build scenarios for years 2015, 2025 (Implementation Year) and 2045 (Horizon Year). A second review of RTC output files was conducted on the additional modeling scenarios requested by the FRA, which assume two-tracks only through Ashland.

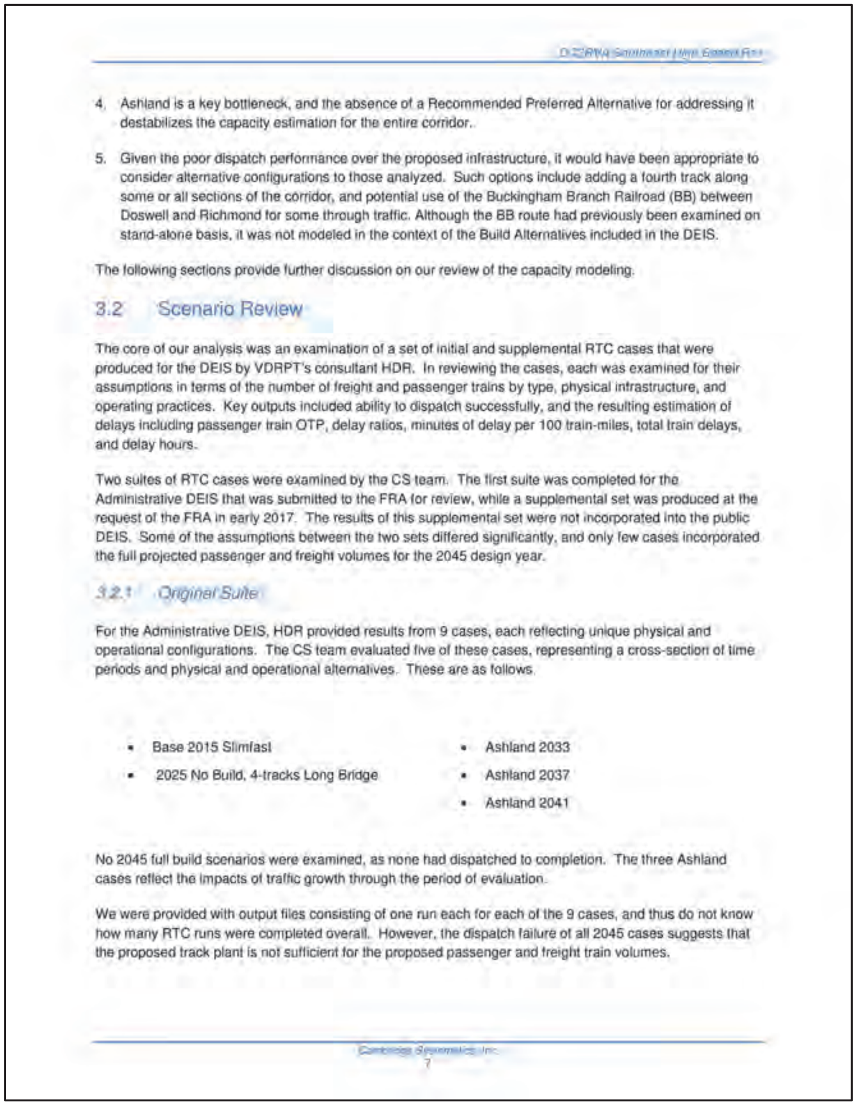
The relevant DEIS sections and other materials that were reviewed are as follows:

- Executive Summary
- Appendix I: Operations Modeling Technical Report
- Files containing RTC model scenarios, as obtained by CSXT and provided to the CS team

Through our review we identified a number of deficiencies in the capacity analysis that fundamentally impede the operational feasibility of the Recommended Preferred Alternative as described in the DEIS. Our principal findings are as follows:

1. The Recommended Preferred Alternative does not result in any significant freight benefits, assuming the projected volumes of passenger and freight traffic. Delay ratios for the CSXT freight trains by train type are high considering the line miles and number of freight trains measured, with overall delays projected to be at least 58% higher than the 2015 base case. As a result, it is difficult to see how the projected level of performance would be commercially acceptable, as the expected service would be erratic and unreliable – sometimes on-time but often late, and sometimes very late. Even 2045 Full Build (FRA supplemental case) fails to meet required freight performance standards because all of the marginal increase in capacity is absorbed by the increase in passenger train service.
2. The initial modeling results do not support the Recommended Preferred Alternative described in the DEIS, as we found that none of the 2045 cases dispatched to completion. These failures indicate that the proposed infrastructure is not adequate for the projected train volumes and mix, and/or there are issues with model input file configurations. Subsequent model runs undertaken at the direction of the FRA earlier in 2017 performed better, but poor projections of train performance.
3. The description of the modeling performed for the project, as described in Appendix I, is incomplete and omits key information needed to understand what was done. The number of model runs and dispatching failures, which indicate the robustness and validity of the modeling, are not provided (although these were provided separately to CSXT). Furthermore, the DEIS does not describe assumptions for scheduled and unscheduled maintenance windows, which obviously affect capacity.

CSXT (continued)



4. Ashland is a key bottleneck, and the absence of a Recommended Preferred Alternative for addressing it destabilizes the capacity estimation for the entire corridor.

5. Given the poor dispatch performance over the proposed infrastructure, it would have been appropriate to consider alternative configurations to those analyzed. Such options include adding a fourth track along some or all sections of the corridor, and potential use of the Buckingham Branch Railroad (BB) between Doswell and Richmond for some through traffic. Although the BB route had previously been examined on stand-alone basis, it was not modeled in the context of the Build Alternatives included in the DEIS.

The following sections provide further discussion on our review of the capacity modeling.

3.2 Scenario Review

The core of our analysis was an examination of a set of initial and supplemental RTC cases that were produced for the DEIS by VDRPT's consultant HDR. In reviewing the cases, each was examined for their assumptions in terms of the number of freight and passenger trains by type, physical infrastructure, and operating practices. Key outputs included ability to dispatch successfully, and the resulting estimation of delays including passenger train OTP, delay ratios, minutes of delay per 100 train-miles, total train delays, and delay hours.

Two suites of RTC cases were examined by the CS team. The first suite was completed for the Administrative DEIS that was submitted to the FRA for review, while a supplemental set was produced at the request of the FRA in early 2017. The results of this supplemental set were not incorporated into the public DEIS. Some of the assumptions between the two sets differed significantly, and only few cases incorporated the full projected passenger and freight volumes for the 2045 design year.

3.2.1 Original Suite

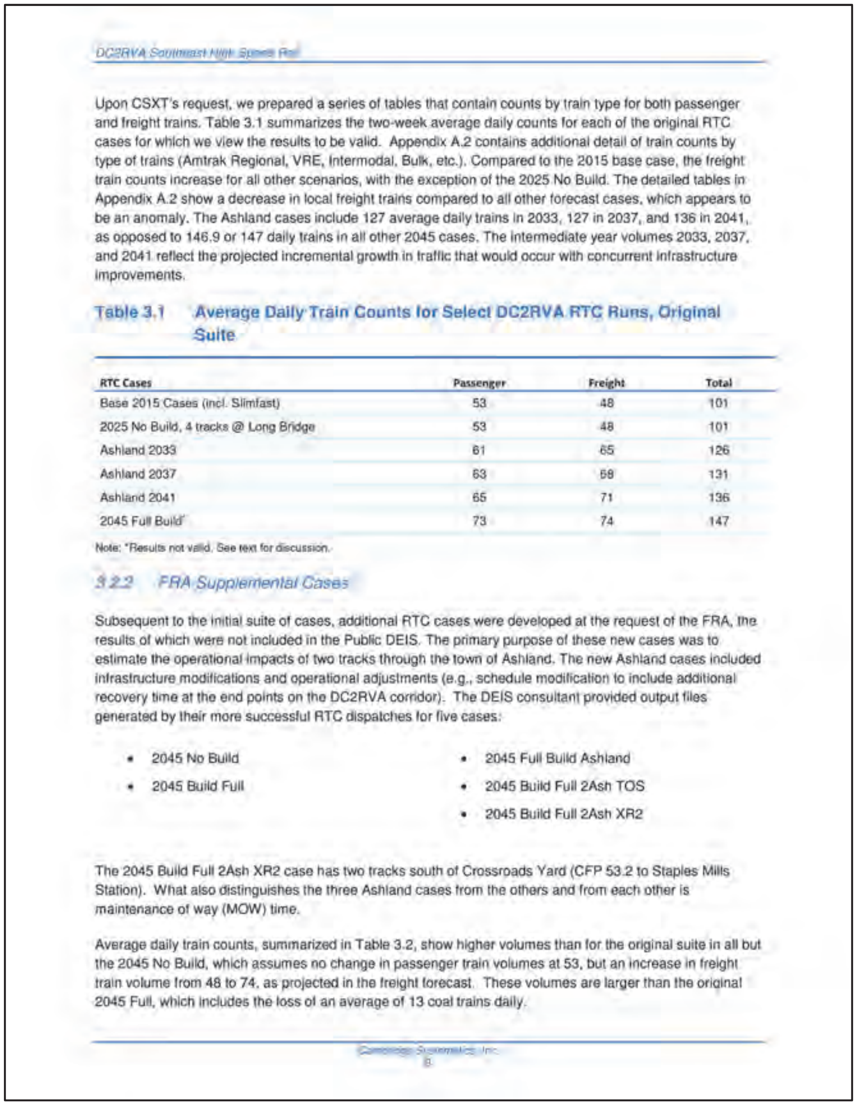
For the Administrative DEIS, HDR provided results from 9 cases, each reflecting unique physical and operational configurations. The CS team evaluated five of these cases, representing a cross-section of time periods and physical and operational alternatives. These are as follows.

- Base 2015 Slimfast
- 2025 No Build, 4-tracks Long Bridge
- Ashland 2033
- Ashland 2037
- Ashland 2041

No 2045 full build scenarios were examined, as none had dispatched to completion. The three Ashland cases reflect the impacts of traffic growth through the period of evaluation.

We were provided with output files consisting of one run each for each of the 9 cases, and thus do not know how many RTC runs were completed overall. However, the dispatch failure of all 2045 cases suggests that the proposed track plant is not sufficient for the proposed passenger and freight train volumes.

CSXT (continued)



Upon CSXT's request, we prepared a series of tables that contain counts by train type for both passenger and freight trains. Table 3.1 summarizes the two-week average daily counts for each of the original RTC cases for which we view the results to be valid. Appendix A.2 contains additional detail of train counts by type of trains (Amtrak Regional, VRE, Intermodal, Bulk, etc.). Compared to the 2015 base case, the freight train counts increase for all other scenarios, with the exception of the 2025 No Build. The detailed tables in Appendix A.2 show a decrease in local freight trains compared to all other forecast cases, which appears to be an anomaly. The Ashland cases include 127 average daily trains in 2033, 127 in 2037, and 136 in 2041, as opposed to 146.9 or 147 daily trains in all other 2045 cases. The intermediate year volumes 2033, 2037, and 2041 reflect the projected incremental growth in traffic that would occur with concurrent infrastructure improvements.

Table 3.1 Average Daily Train Counts for Select DC2RVA RTC Runs, Original Suite

RTC Cases	Passenger	Freight	Total
Base 2015 Cases (incl. Slimfast)	53	48	101
2025 No Build, 4 tracks @ Long Bridge	53	48	101
Ashland 2033	61	65	126
Ashland 2037	63	68	131
Ashland 2041	65	71	136
2045 Full Build*	73	74	147

Note: *Results not valid. See text for discussion.

3.2.2 FRA Supplemental Cases

Subsequent to the initial suite of cases, additional RTC cases were developed at the request of the FRA, the results of which were not included in the Public DEIS. The primary purpose of these new cases was to estimate the operational impacts of two tracks through the town of Ashland. The new Ashland cases included infrastructure modifications and operational adjustments (e.g., schedule modification to include additional recovery time at the end points on the DC2RVA corridor). The DEIS consultant provided output files generated by their more successful RTC dispatches for five cases:

- 2045 No Build
- 2045 Build Full
- 2045 Full Build Ashland
- 2045 Build Full 2Ash TOS
- 2045 Build Full 2Ash XR2

The 2045 Build Full 2Ash XR2 case has two tracks south of Crossroads Yard (CFP 53.2 to Staples Mills Station). What also distinguishes the three Ashland cases from the others and from each other is maintenance of way (MOW) time.

Average daily train counts, summarized in Table 3.2, show higher volumes than for the original suite in all but the 2045 No Build, which assumes no change in passenger train volumes at 53, but an increase in freight train volume from 48 to 74, as projected in the freight forecast. These volumes are larger than the original 2045 Full, which includes the loss of an average of 13 coal trains daily.

CSXT (continued)

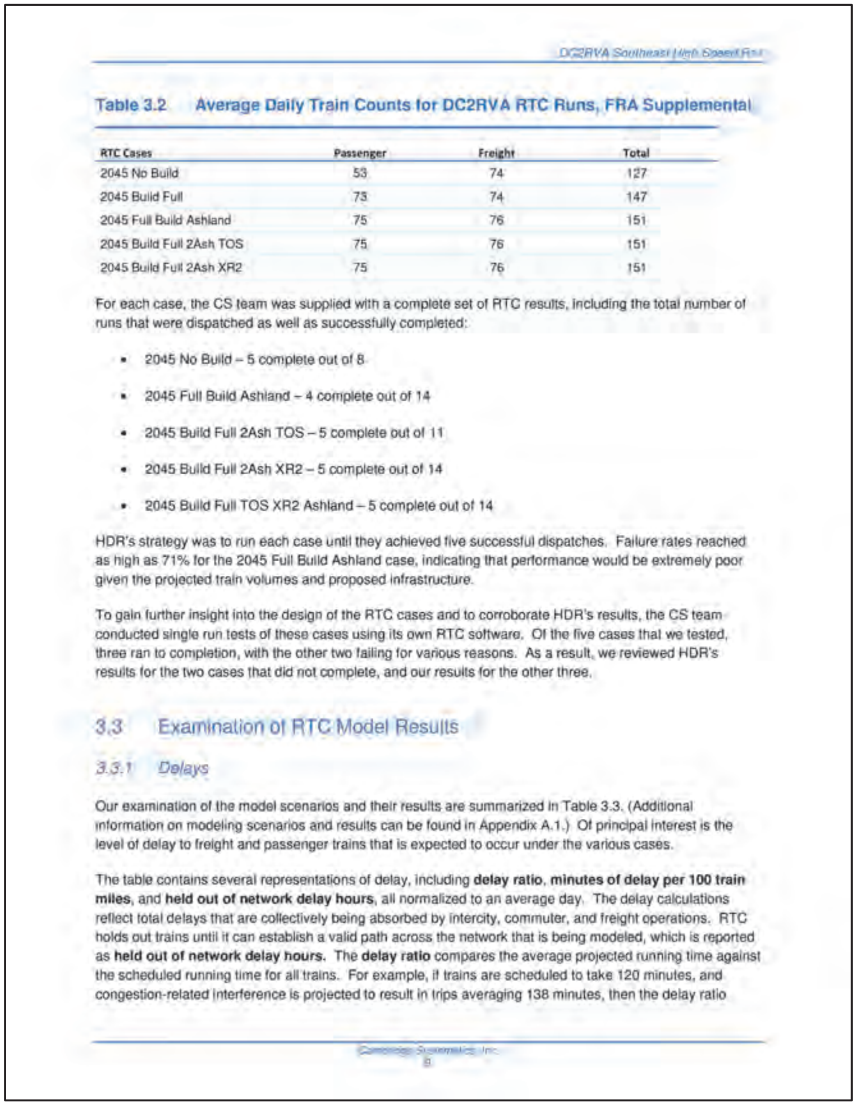


Table 3.2 Average Daily Train Counts for DC2RVA RTC Runs, FRA Supplemental

RTC Cases	Passenger	Freight	Total
2045 No Build	53	74	127
2045 Build Full	73	74	147
2045 Full Build Ashland	75	76	151
2045 Build Full 2Ash TOS	75	76	151
2045 Build Full 2Ash XR2	75	76	151

For each case, the CS team was supplied with a complete set of RTC results, including the total number of runs that were dispatched as well as successfully completed:

- 2045 No Build – 5 complete out of 8
- 2045 Full Build Ashland – 4 complete out of 14
- 2045 Build Full 2Ash TOS – 5 complete out of 11
- 2045 Build Full 2Ash XR2 – 5 complete out of 14
- 2045 Build Full TOS XR2 Ashland – 5 complete out of 14

HDR's strategy was to run each case until they achieved five successful dispatches. Failure rates reached as high as 71% for the 2045 Full Build Ashland case, indicating that performance would be extremely poor given the projected train volumes and proposed infrastructure.

To gain further insight into the design of the RTC cases and to corroborate HDR's results, the CS team conducted single run tests of these cases using its own RTC software. Of the five cases that we tested, three ran to completion, with the other two failing for various reasons. As a result, we reviewed HDR's results for the two cases that did not complete, and our results for the other three.

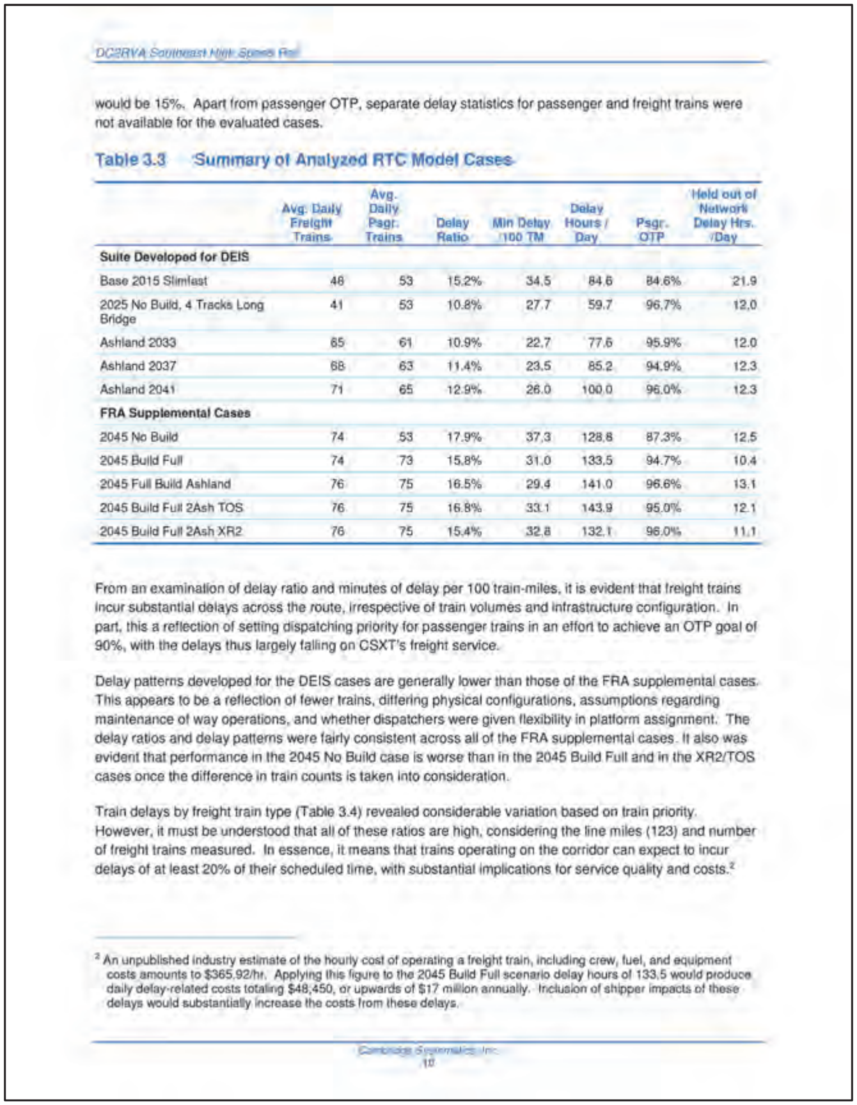
3.3 Examination of RTC Model Results

3.3.1 Delays

Our examination of the model scenarios and their results are summarized in Table 3.3. (Additional information on modeling scenarios and results can be found in Appendix A.1.) Of principal interest is the level of delay to freight and passenger trains that is expected to occur under the various cases.

The table contains several representations of delay, including **delay ratio**, **minutes of delay per 100 train miles**, and **held out of network delay hours**, all normalized to an average day. The delay calculations reflect total delays that are collectively being absorbed by intercity, commuter, and freight operations. RTC holds out trains until it can establish a valid path across the network that is being modeled, which is reported as **held out of network delay hours.** The **delay ratio** compares the average projected running time against the scheduled running time for all trains. For example, if trains are scheduled to take 120 minutes, and congestion-related interference is projected to result in trips averaging 138 minutes, then the delay ratio

CSXT (continued)



would be 15%. Apart from passenger OTP, separate delay statistics for passenger and freight trains were not available for the evaluated cases.

Table 3.3 Summary of Analyzed RTC Model Cases

	Avg. Daily Freight Trains	Avg. Daily Psgr. Trains	Delay Ratio	Min Delay /100 TM	Delay Hours / Day	Psgr. OTP	Held out of Network Delay Hrs. /Day
Suite Developed for DEIS							
Base 2015 Slimfast	46	53	15.2%	34.5	84.6	84.6%	21.9
2025 No Build, 4 Tracks Long Bridge	41	53	10.8%	27.7	59.7	96.7%	12.0
Ashland 2033	65	61	10.9%	22.7	77.6	95.9%	12.0
Ashland 2037	68	63	11.4%	23.5	85.2	94.9%	12.3
Ashland 2041	71	65	12.9%	26.0	100.0	96.0%	12.3
FRA Supplemental Cases							
2045 No Build	74	53	17.9%	37.3	128.8	87.3%	12.5
2045 Build Full	74	73	15.8%	31.0	133.5	94.7%	10.4
2045 Full Build Ashland	76	75	16.5%	29.4	141.0	96.6%	13.1
2045 Build Full 2Ash TOS	76	75	16.8%	33.1	143.9	95.0%	12.1
2045 Build Full 2Ash XR2	76	75	15.4%	32.8	132.1	96.0%	11.1

From an examination of delay ratio and minutes of delay per 100 train-miles, it is evident that freight trains incur substantial delays across the route, irrespective of train volumes and infrastructure configuration. In part, this a reflection of setting dispatching priority for passenger trains in an effort to achieve an OTP goal of 90%, with the delays thus largely falling on CSXT's freight service.

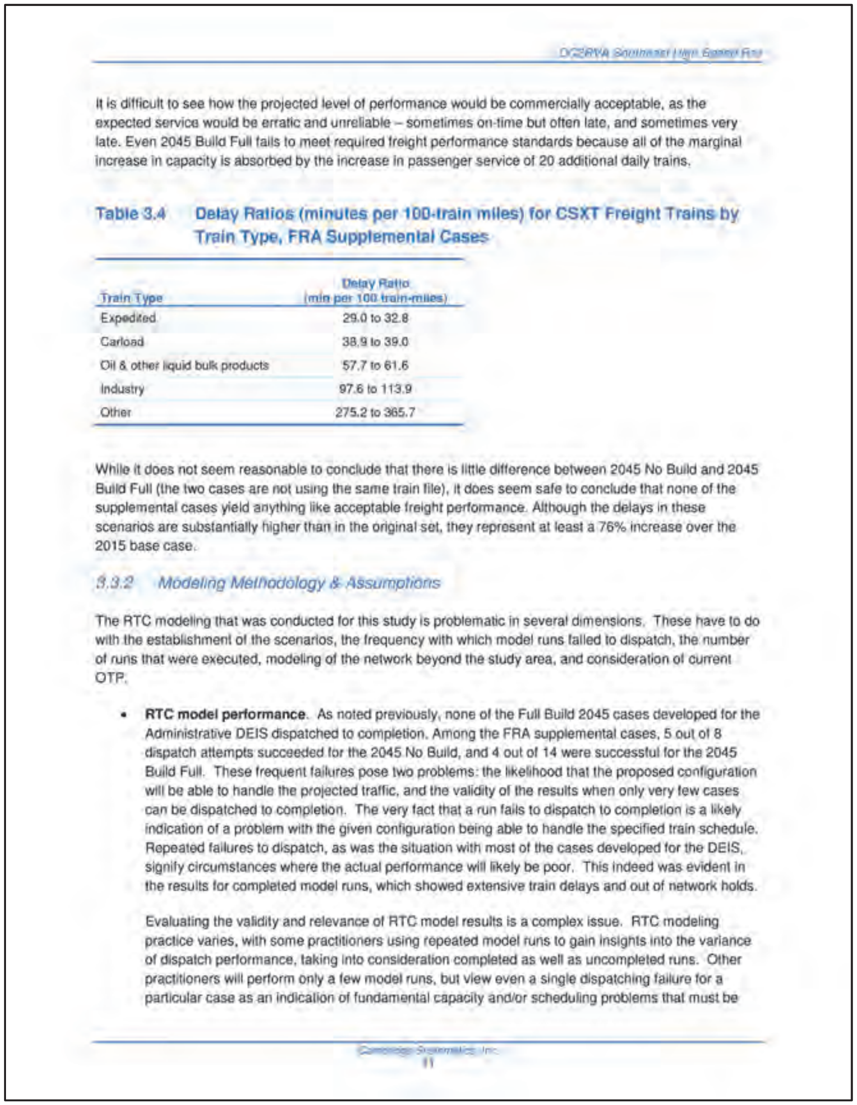
Delay patterns developed for the DEIS cases are generally lower than those of the FRA supplemental cases. This appears to be a reflection of fewer trains, differing physical configurations, assumptions regarding maintenance of way operations, and whether dispatchers were given flexibility in platform assignment. The delay ratios and delay patterns were fairly consistent across all of the FRA supplemental cases. It also was evident that performance in the 2045 No Build case is worse than in the 2045 Build Full and in the XR2/TOS cases once the difference in train counts is taken into consideration.

Train delays by freight train type (Table 3.4) revealed considerable variation based on train priority. However, it must be understood that all of these ratios are high, considering the line miles (123) and number of freight trains measured. In essence, it means that trains operating on the corridor can expect to incur delays of at least 20% of their scheduled time, with substantial implications for service quality and costs.[2]

---

[2] An unpublished industry estimate of the hourly cost of operating a freight train, including crew, fuel, and equipment costs amounts to $365.92/hr. Applying this figure to the 2045 Build Full scenario delay hours of 133.5 would produce daily delay-related costs totaling $48,450, or upwards of $17 million annually. Inclusion of shipper impacts of these delays would substantially increase the costs from these delays.

CSXT (continued)



It is difficult to see how the projected level of performance would be commercially acceptable, as the expected service would be erratic and unreliable – sometimes on-time but often late, and sometimes very late. Even 2045 Build Full fails to meet required freight performance standards because all of the marginal increase in capacity is absorbed by the increase in passenger service of 20 additional daily trains.

Table 3.4 Delay Ratios (minutes per 100-train miles) for CSXT Freight Trains by Train Type, FRA Supplemental Cases

Train Type	Delay Ratio (min per 100 train-miles)
Expedited	29.0 to 32.8
Carload	38.9 to 39.0
Oil & other liquid bulk products	57.7 to 61.6
Industry	97.6 to 113.9
Other	275.2 to 365.7

While it does not seem reasonable to conclude that there is little difference between 2045 No Build and 2045 Build Full (the two cases are not using the same train file), it does seem safe to conclude that none of the supplemental cases yield anything like acceptable freight performance. Although the delays in these scenarios are substantially higher than in the original set, they represent at least a 76% increase over the 2015 base case.

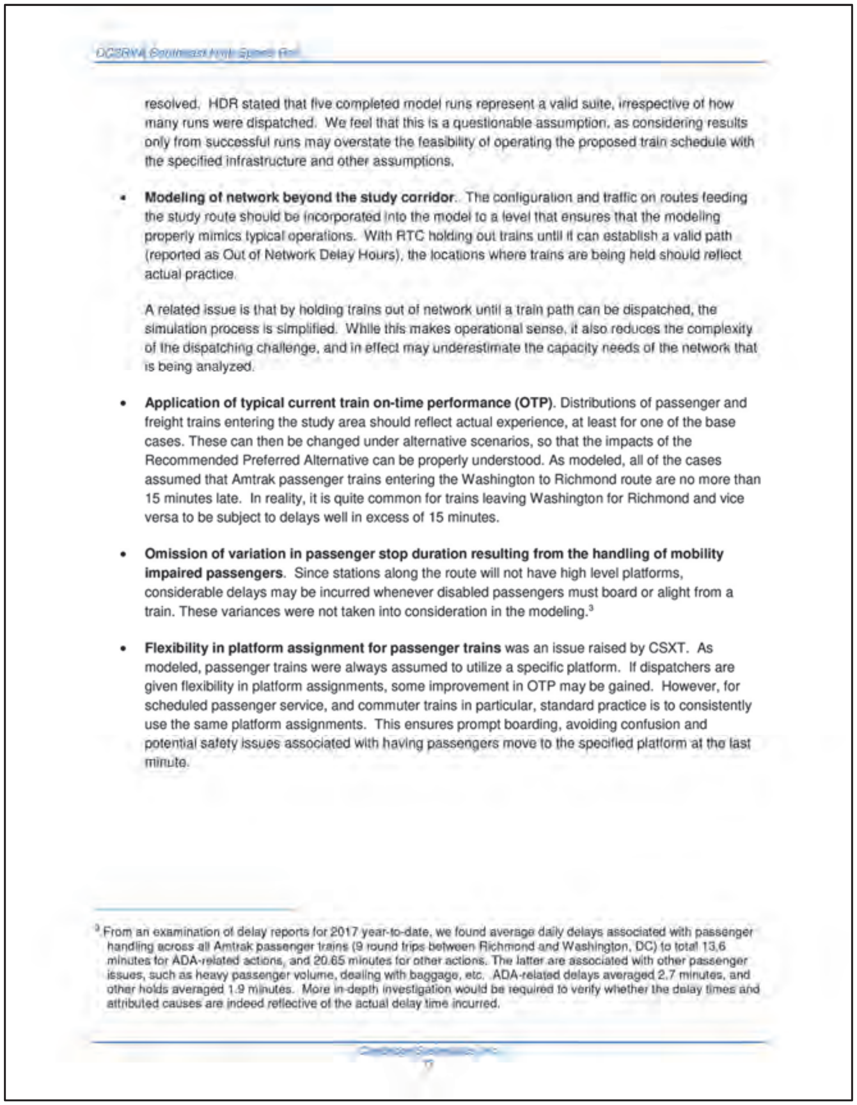
3.3.2 Modeling Methodology & Assumptions

The RTC modeling that was conducted for this study is problematic in several dimensions. These have to do with the establishment of the scenarios, the frequency with which model runs failed to dispatch, the number of runs that were executed, modeling of the network beyond the study area, and consideration of current OTP.

- **RTC model performance**. As noted previously, none of the Full Build 2045 cases developed for the Administrative DEIS dispatched to completion. Among the FRA supplemental cases, 5 out of 8 dispatch attempts succeeded for the 2045 No Build, and 4 out of 14 were successful for the 2045 Build Full. These frequent failures pose two problems: the likelihood that the proposed configuration will be able to handle the projected traffic, and the validity of the results when only very few cases can be dispatched to completion. The very fact that a run fails to dispatch to completion is a likely indication of a problem with the given configuration being able to handle the specified train schedule. Repeated failures to dispatch, as was the situation with most of the cases developed for the DEIS, signify circumstances where the actual performance will likely be poor. This indeed was evident in the results for completed model runs, which showed extensive train delays and out of network holds.

  Evaluating the validity and relevance of RTC model results is a complex issue. RTC modeling practice varies, with some practitioners using repeated model runs to gain insights into the variance of dispatch performance, taking into consideration completed as well as uncompleted runs. Other practitioners will perform only a few model runs, but view even a single dispatching failure for a particular case as an indication of fundamental capacity and/or scheduling problems that must be resolved. HDR stated that five completed model runs represent a valid suite, irrespective of how many runs were dispatched. We feel that this is a questionable assumption, as considering results only from successful runs may overstate the feasibility of operating the proposed train schedule with the specified infrastructure and other assumptions.

CSXT (continued)



- **Modeling of network beyond the study corridor**. The configuration and traffic on routes feeding the study route should be incorporated into the model to a level that ensures that the modeling properly mimics typical operations. With RTC holding out trains until it can establish a valid path (reported as Out of Network Delay Hours), the locations where trains are being held should reflect actual practice.

  A related issue is that by holding trains out of network until a train path can be dispatched, the simulation process is simplified. While this makes operational sense, it also reduces the complexity of the dispatching challenge, and in effect may underestimate the capacity needs of the network that is being analyzed.

- **Application of typical current train on-time performance (OTP)**. Distributions of passenger and freight trains entering the study area should reflect actual experience, at least for one of the base cases. These can then be changed under alternative scenarios, so that the impacts of the Recommended Preferred Alternative can be properly understood. As modeled, all of the cases assumed that Amtrak passenger trains entering the Washington to Richmond route are no more than 15 minutes late. In reality, it is quite common for trains leaving Washington for Richmond and vice versa to be subject to delays well in excess of 15 minutes.

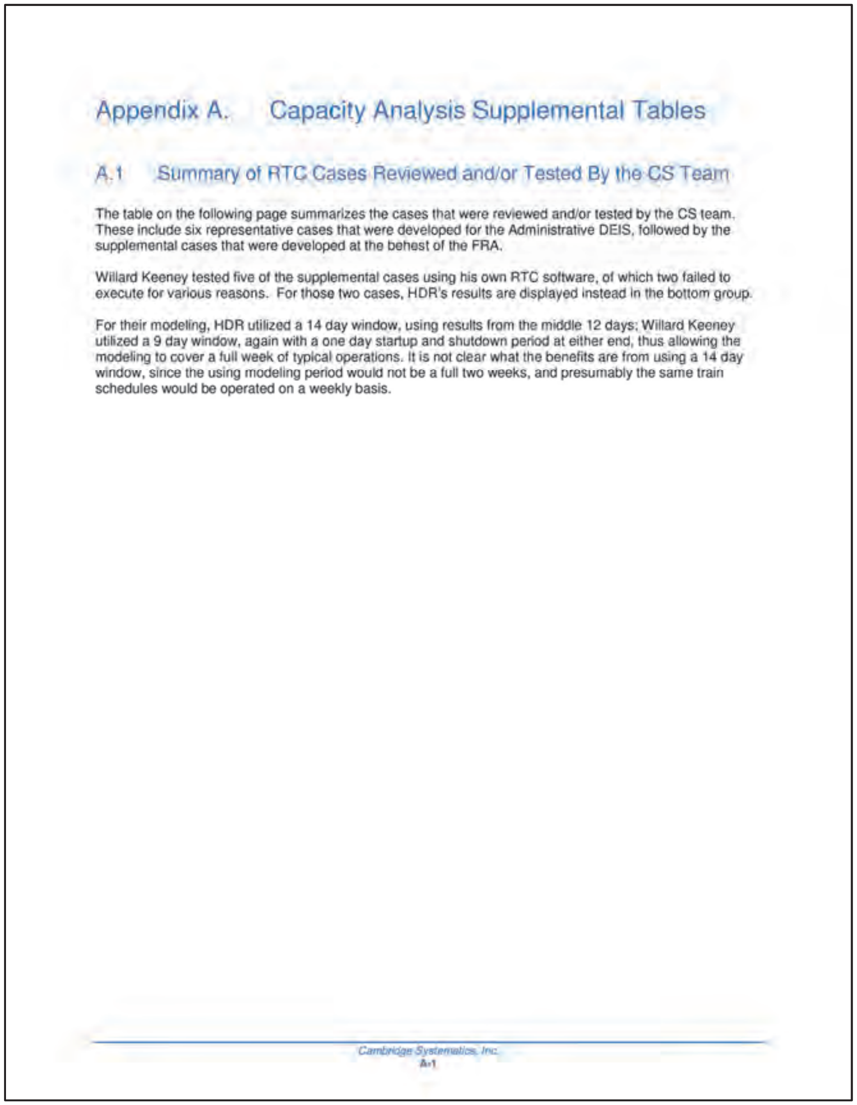
- **Omission of variation in passenger stop duration resulting from the handling of mobility impaired passengers**. Since stations along the route will not have high level platforms, considerable delays may be incurred whenever disabled passengers must board or alight from a train. These variances were not taken into consideration in the modeling.[3]

- **Flexibility in platform assignment for passenger trains** was an issue raised by CSXT. As modeled, passenger trains were always assumed to utilize a specific platform. If dispatchers are given flexibility in platform assignments, some improvement in OTP may be gained. However, for scheduled passenger service, and commuter trains in particular, standard practice is to consistently use the same platform assignments. This ensures prompt boarding, avoiding confusion and potential safety issues associated with having passengers move to the specified platform at the last minute.

---

[3] From an examination of delay reports for 2017 year-to-date, we found average daily delays associated with passenger handling across all Amtrak passenger trains (9 round trips between Richmond and Washington, DC) to total 13.6 minutes for ADA-related actions, and 20.65 minutes for other actions. The latter are associated with other passenger issues, such as heavy passenger volume, dealing with baggage, etc. ADA-related delays averaged 2.7 minutes, and other holds averaged 1.9 minutes. More in-depth investigation would be required to verify whether the delay times and attributed causes are indeed reflective of the actual delay time incurred.

CSXT (continued)



Appendix A. Capacity Analysis Supplemental Tables

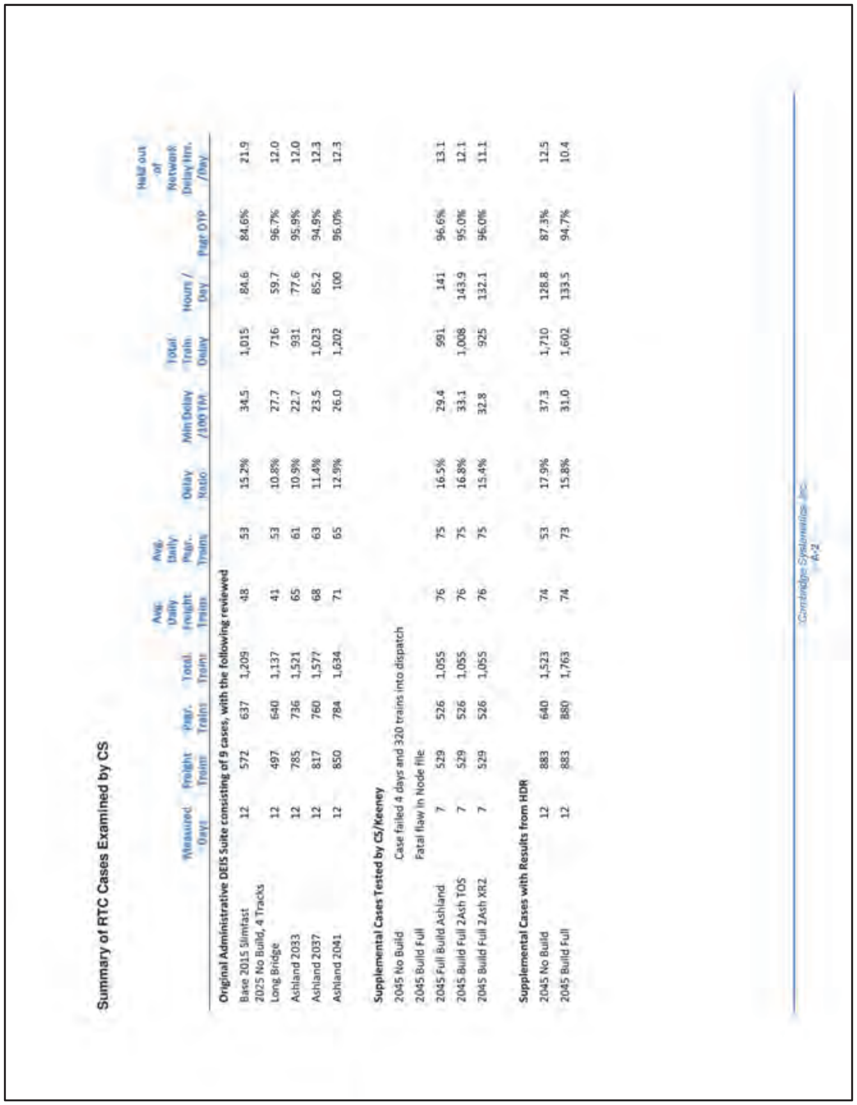
A.1 Summary of RTC Cases Reviewed and/or Tested By the CS Team

The table on the following page summarizes the cases that were reviewed and/or tested by the CS team. These include six representative cases that were developed for the Administrative DEIS, followed by the supplemental cases that were developed at the behest of the FRA.

Willard Keeney tested five of the supplemental cases using his own RTC software, of which two failed to execute for various reasons. For those two cases, HDR's results are displayed instead in the bottom group.

For their modeling, HDR utilized a 14 day window, using results from the middle 12 days; Willard Keeney utilized a 9 day window, again with a one day startup and shutdown period at either end, thus allowing the modeling to cover a full week of typical operations. It is not clear what the benefits are from using a 14 day window, since the using modeling period would not be a full two weeks, and presumably the same train schedules would be operated on a weekly basis.

CSXT (continued)



Summary of RTC Cases Examined by CS

	Measured Days	Freight Trains	Psgr. Trains	Total Trains	Avg. Daily Freight Trains	Avg. Daily Psgr. Trains	Delay Ratio	Min Delay /100 TM	Total Train Delay	Hours / Day	Psgr OTP	Held out of Network Delay Hrs. /Day

Re: Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation

Dear Ms. Stock:

Norfolk Southern takes this opportunity to provide a few brief remarks on the Washington, D.C. to Richmond High Speed Rail Project, Tier II Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation (the "DEIS"). The notice of availability for the DEIS was published in the Federal Register on September 8, 2017.

1

The scope of the DC2RVA Tier II DEIS is specific. The DC2RVA corridor "extends 123 miles along an existing rail corridor owned by CSX Transportation (CSXT) from the Long Bridge across the Potomac River in Arlington, VA, to Centralia, VA in Chesterfield County, south of Richmond." DEIS, Executive Summary at 1. "Improvements made in adjoining rail corridors are outside the scope of the DC2RVA Project." DEIS, Section 2.2.2.2, page 2-9. The environmental and operational analysis thus does not extend to any other location or route.[1]

Notwithstanding that, the DEIS ignores this limited geographic and operational scope. For example, on page 14 of the Executive Summary, the DEIS states that "DRPT is proposing to add nine daily round trip SEHSR passenger trains to the corridor by 2025, which would be incorporated into Amtrak's passenger rail network and serve the Northeast Corridor north of Washington, D.C. as part of the DC2RVA Project."[2] Three (3) of those are identified as being roundtrip frequencies to Norfolk,

---

[1] For example, the table of effects on the natural and human environment appearing on pages 47 through 52 of the Executive Summary fails to list effects on any property other than that along the identified 123 mile rail corridor. The basis of design was to "contemplate[] a series of improvement projects that are required to deliver higher speed passenger rail service … along the 123-mile corridor from Washington, D.C. to Richmond." DEIS, Appendix B, Basis of Design Report, page E-1. The operational simulation modeling work performed for the DEIS were made solely "within the geographic limits of the DC2RVA corridor." DEIS, Appendix O, Operations Modeling Technical Report, page 1-3.

[2] See also, DEIS, Section 2.2.2.2, page 2-8 (same).

NORFOLK SOUTHERN

1. The Purpose of the DC2RVA Project is to increase capacity to deliver higher speed passenger rail, expand commuter rail, and accommodate growth of freight rail service in an efficient and reliable multimodal corridor between Washington, D.C. and Richmond, VA. While the Project's capacity-related infrastructure improvements are limited to the 123 miles between Arlington (RO Interlocking) and Centralia, VA, the Project recognizes the reality that many of the proposed train frequencies would not operate solely within the DC2RVA corridor. Thus, while the DC2RVA Draft and Final Environmental Impact Statements (EIS) evaluate the effects of capacity improvements within the corridor, each includes operational analyses of trains moving into, out of, and beyond the limits of the corridor. The DC2RVA Project does not, by itself, ensure that these additional passenger services would occur – rather, the DC2RVA Project ensures that there would be sufficient capacity within the Washington, D.C. to Richmond corridor for these additional passenger services to operate, should they be added incrementally between the current year and the planning horizon for the Project (2045).

   The DC2RVA Project carries forward the purpose of the 2002 Tier I EIS within the Washington, D.C. and Richmond corridor. The Project builds on the 2002 Tier I Final EIS and Record of Decision (ROD), and subsequent related studies (identified in the Final EIS Section 1.2), including the 2017 Richmond to Raleigh Tier II Final EIS and ROD and the 2012 Richmond to Hampton Roads Tier I Final EIS. The DC2RVA Project used these studies and decisions in determining the anticipated frequency of intercity passenger rail service in the DC2RVA corridor, and thereby the specific capacity improvements within the corridor necessary to support the additional passenger trains while accommodating commuter rail and growth of freight service. In keeping with the 2002 Tier I ROD, and the determination of the Federal Railroad Administration (FRA) to develop the program incrementally, the DC2RVA Project is itself just one increment of a larger program. The Department of Rail and Public Transportation (DRPT) recognizes that additional planning, analysis,

Re: Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation

Dear Ms. Stock:

Norfolk Southern takes this opportunity to provide a few brief remarks on the Washington, D.C. to Richmond High Speed Rail Project, Tier II Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation (the "DEIS"). The notice of availability for the DEIS was published in the Federal Register on September 8, 2017.

1

The scope of the DC2RVA Tier II DEIS is specific. The DC2RVA corridor "extends 123 miles along an existing rail corridor owned by CSX Transportation (CSXT) from the Long Bridge across the Potomac River in Arlington, VA, to Centralia, VA in Chesterfield County, south of Richmond." DEIS, Executive Summary at 1. "Improvements made in adjoining rail corridors are outside the scope of the DC2RVA Project." DEIS, Section 2.2.2.2, page 2-9. The environmental and operational analysis thus does not extend to any other location or route.[1]

Notwithstanding that, the DEIS ignores this limited geographic and operational scope. For example, on page 14 of the Executive Summary, the DEIS states that "DRPT is proposing to add nine daily round trip SEHSR passenger trains to the corridor by 2025, which would be incorporated into Amtrak's passenger rail network and serve the Northeast Corridor north of Washington, D.C. as part of the DC2RVA Project."[2] Three (3) of those are identified as being roundtrip frequencies to Norfolk,

---

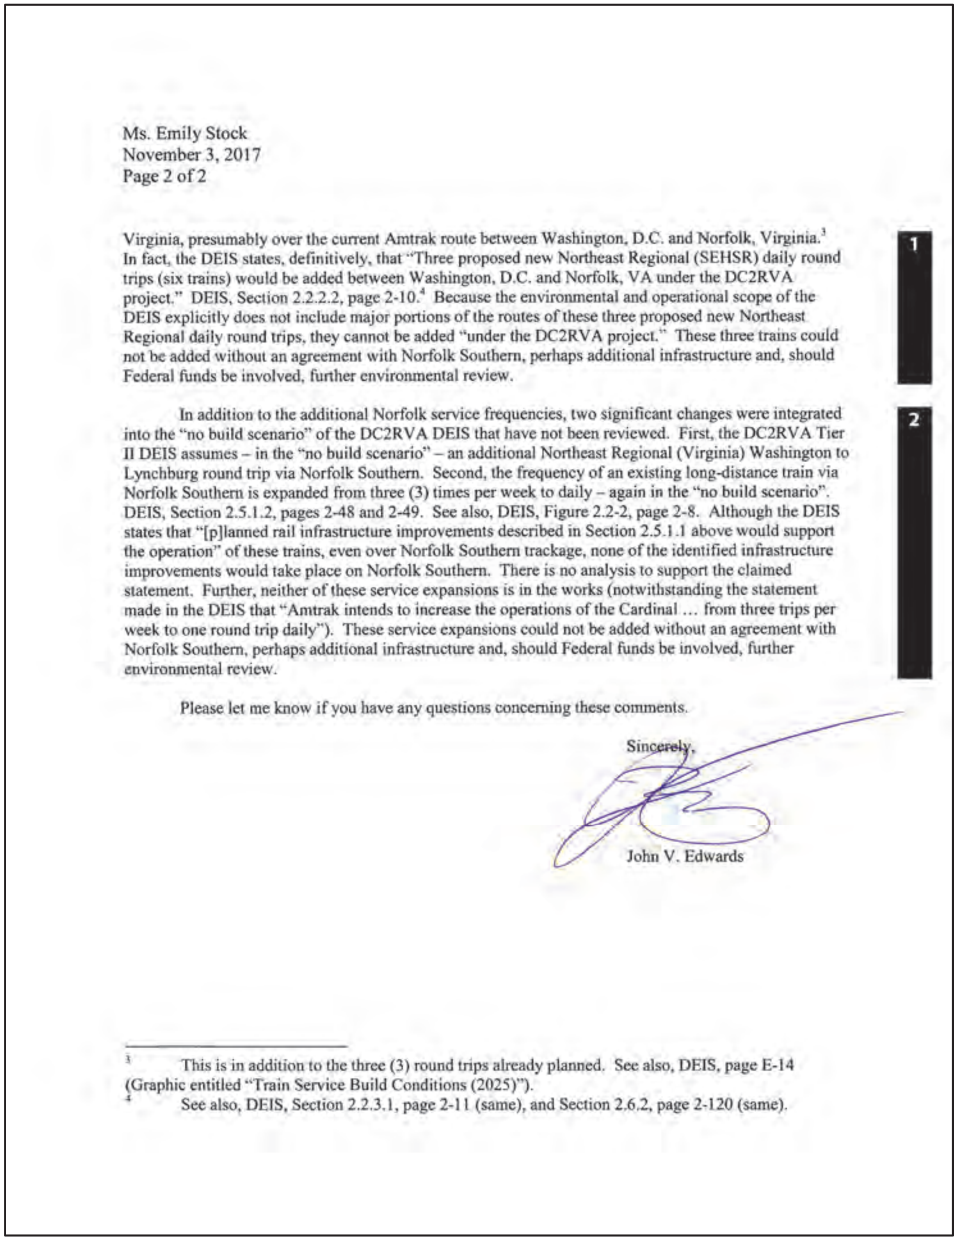
[1] For example, the table of effects on the natural and human environment appearing on pages 47 through 52 of the Executive Summary fails to list effects on any property other than that along the identified 123 mile rail corridor. The basis of design was to "contemplate[] a series of improvement projects that are required to deliver higher speed passenger rail service … along the 123-mile corridor from Washington, D.C. to Richmond." DEIS, Appendix B, Basis of Design Report, page E-1. The operational simulation modeling work performed for the DEIS were made solely "within the geographic limits of the DC2RVA corridor." DEIS, Appendix O, Operations Modeling Technical Report, page 1-3.

[2] See also, DEIS, Section 2.2.2.2, page 2-8 (same).

NORFOLK SOUTHERN (continued)

engineering and host railroad coordination would need to be completed prior to extending additional Northeast Regional service to Norfolk. Section 7.7 of the Final EIS, which has been added since the Draft EIS, details the coordination with other previous, ongoing, concurrent, and planned studies and projects within or adjacent to the DC2RVA corridor that are critical to the DC2RVA Project; Section 7.7.2 specifically details the coordination with other Southeast High Speed Rail (SEHSR) projects, including trains to Norfolk as part of the Richmond to Hampton Roads study.

Additionally, DRPT conducted refined modeling subsequent to the Draft EIS preliminary simulation modeling; the findings of this effort are summarized in Section 3.2 of the Final EIS and fully discussed in Appendix F.



Ms. Emily Stock
November 3, 2017
Page 2 of 2

1 Virginia, presumably over the current Amtrak route between Washington, D.C. and Norfolk, Virginia.[3] In fact, the DEIS states, definitively, that "Three proposed new Northeast Regional (SEHSR) daily round trips (six trains) would be added between Washington, D.C. and Norfolk, VA under the DC2RVA project." DEIS, Section 2.2.2.2, page 2-10.[4] Because the environmental and operational scope of the DEIS explicitly does not include major portions of the routes of these three proposed new Northeast Regional daily round trips, they cannot be added "under the DC2RVA project." These three trains could not be added without an agreement with Norfolk Southern, perhaps additional infrastructure and, should Federal funds be involved, further environmental review.

2 In addition to the additional Norfolk service frequencies, two significant changes were integrated into the "no build scenario" of the DC2RVA DEIS that have not been reviewed. First, the DC2RVA Tier II DEIS assumes – in the "no build scenario" – an additional Northeast Regional (Virginia) Washington to Lynchburg round trip via Norfolk Southern. Second, the frequency of an existing long-distance train via Norfolk Southern is expanded from three (3) times per week to daily – again in the "no build scenario". DEIS, Section 2.5.1.2, pages 2-48 and 2-49. See also, DEIS, Figure 2.2-2, page 2-8. Although the DEIS states that "[p]lanned rail infrastructure improvements described in Section 2.5.1.1 above would support the operation" of these trains, even over Norfolk Southern trackage, none of the identified infrastructure improvements would take place on Norfolk Southern. There is no analysis to support the claimed statement. Further, neither of these service expansions is in the works (notwithstanding the statement made in the DEIS that "Amtrak intends to increase the operations of the Cardinal … from three trips per week to one round trip daily"). These service expansions could not be added without an agreement with Norfolk Southern, perhaps additional infrastructure and, should Federal funds be involved, further environmental review.

Please let me know if you have any questions concerning these comments.

Sincerely,

John V. Edwards

---

[3] This is in addition to the three (3) round trips already planned. See also, DEIS, page E-14 (Graphic entitled "Train Service Build Conditions (2025)").

[4] See also, DEIS, Section 2.2.3.1, page 2-11 (same), and Section 2.6.2, page 2-120 (same).

NORFOLK SOUTHERN (continued)

(Response to comment 1 on previous page)

2. The No Build Alternative incorporates existing and future infrastructure and service levels from planned investments in the corridor that are likely to occur independent of the capacity improvements planned by the DC2RVA Project. If a project or additional service level was under construction, fully-funded, or was the focus of advanced collaborative planning, it was assumed to be complete by 2025 for the purposes of the Draft EIS evaluation. An additional Northeast Regional (Virginia-supported) Washington, D.C. to Lynchburg, VA round trip was identified in the 2017 Virginia Statewide Rail Plan as a short-term project that the Commonwealth of Virginia intends to pursue. Daily operation of Amtrak's long-distance Cardinal between New York and Chicago was proposed in Amtrak's Passenger Rail Investment and Improvement Act (PRIIA) Section 210 Performance Improvement Plan for the Cardinal dated September 2010 and reaffirmed by Amtrak as a service increase to include in the No Build assumptions for planning purposes for the DC2RVA Project.

   As stated above, the DC2RVA Project does not, by itself, ensure that these additional passenger services would occur – rather, the DC2RVA Project ensures that there would be sufficient capacity within the Washington, D.C. to Richmond corridor for these additional passenger services to operate. Section 4.2 of the Final EIS presents the service plan of the Preferred Alternative, which will be further refined in the Corridor Service Development Plan (SDP) for the Project, which is summarized in Chapter 7 of the Final EIS.

Amtrak Comments on DC2RVA Draft EIS Recommended Alternatives

The National Railroad Passenger Corporation ("Amtrak") is pleased to submit comments for the administrative record regarding the Federal Railroad Administration's ("FRA") and Virginia Department of Rail and Public Transportation ("DRPT")-sponsored Tier II Draft Environmental Impact Statement ("DEIS") for the Washington, DC to Richmond, VA ("DC2RVA") corridor element of the Washington, DC to Charlotte, NC Southeast High Speed Rail initiative (SEHSR).

Amtrak supports the stated Purpose and Need of the DC2RVA project to increase track capacity to allow greater passenger train speeds and frequencies to be operated on the Richmond-Washington section of the SEHSR in the state of Virginia, serving a projected service volume of 22 intercity, 17 commuter and between 10 and 20 freight round trips per day along the northernmost segment of this corridor.

Amtrak, as a partner with the State of Virginia, stands ready to expand to these projected levels of high-speed, regional and long-distance intercity passenger rail service south of Washington to the multiple destinations included in the draft service plans in the DC2RVA DEIS, contingent on available equipment and manpower.

Amtrak has been provided the DC2RVA draft service plan train times and frequency and will be evaluating how that can fit into our expansion and reconstruction plans for Washington Union Station along with those of the commuter rail operators. 1

Amtrak also reserves the right to perform its own network modeling to determine impacts to train performance based on the new levels of through DC2RVA service and the expanded VRE service frequency planned into Washington Union Station. 2
However, Amtrak also expresses the following specific concerns on options presented in the DEIS. The first of these concerns relates to the operating and technical performance specifications underlying the improvements proposed.

Recognizing the operating constraints inherent in dense passenger operations on a heavy freight main line owned by a rail freight carrier (such as here on CSX's Richmond Line), Amtrak urges that consideration be made in the FEIS-phase analysis to the feasibility of introducing substantial segments of higher-performance (e.g., 110-mph operating speed design) new trackage, either adjacent or in the general vicinity of the existing CSX corridor south of Fredericksburg (e.g., Alternative Areas 4 and 5 in the DEIS). 3

The opportunity for new right-of-way sections would be particularly beneficial in the Ashland section (Alternative Area 5), where the option for a new bypass segment to the east of the community could overcome the severe constraints to higher-performance rail operations posed by the current street-level downtown alignment that could relieve the burden of heavy freight and passenger rail traffic operations through the center of this historic community. 4

AMTRAK

1. and 2. Comments noted. The Department of Rail and Public Transportation (DRPT) will continue to collaborate with Amtrak as it refines the passenger rail service plan and conceptual schedule for the Preferred Alternative during the preparation of the Corridor Service Development Plan (SDP) for the DC2RVA Project and beyond into final design.

3. The engineering and service plans presented in the DC2RVA Tier II Draft and Final Environmental Impact Statements (EIS) were developed based on the 2002 Tier I Final EIS and Record of Decision (ROD) issued for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC, which selected an incremental approach to developing the SEHSR program. Key elements of the selected incremental approach are:

   - Upgrade existing rail corridors (instead of developing new corridors).
   - Utilize fossil-fuel burning equipment rather than electric-powered equipment.
   - Add service as market demand increases and/or when funding is available.

   The incremental approach seeks to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible. Passenger service and freight service would share the CSXT-owned tracks. The 2002 Tier I EIS assumed a maximum speed of 110 mph, with an average speed of approximately 70 mph along the full length of the SEHSR corridor between Washington, D.C. and Charlotte, NC. Subsequently, in 2009, the Federal Railroad Administration (FRA) released its strategic plan for higher speed rail in America; investment strategies included upgrading reliability and service on conventional intercity rail services (operating speeds up to 79 to 90 mph on shared track) and developing emerging and regional higher-speed corridor services (operating speeds up to 90 to 110 mph on shared track). Also in September 2009,

Amtrak Comments on DC2RVA Draft EIS Recommended Alternatives

The National Railroad Passenger Corporation ("Amtrak") is pleased to submit comments for the administrative record regarding the Federal Railroad Administration's ("FRA") and Virginia Department of Rail and Public Transportation ("DRPT")-sponsored Tier II Draft Environmental Impact Statement ("DEIS") for the Washington, DC to Richmond, VA ("DC2RVA") corridor element of the Washington, DC to Charlotte, NC Southeast High Speed Rail initiative (SEHSR).

Amtrak supports the stated Purpose and Need of the DC2RVA project to increase track capacity to allow greater passenger train speeds and frequencies to be operated on the Richmond-Washington section of the SEHSR in the state of Virginia, serving a projected service volume of 22 intercity, 17 commuter and between 10 and 20 freight round trips per day along the northernmost segment of this corridor.

Amtrak, as a partner with the State of Virginia, stands ready to expand to these projected levels of high-speed, regional and long-distance intercity passenger rail service south of Washington to the multiple destinations included in the draft service plans in the DC2RVA DEIS, contingent on available equipment and manpower.

Amtrak has been provided the DC2RVA draft service plan train times and frequency and will be evaluating how that can fit into our expansion and reconstruction plans for Washington Union Station along with those of the commuter rail operators. 1

Amtrak also reserves the right to perform its own network modeling to determine impacts to train performance based on the new levels of through DC2RVA service and the expanded VRE service frequency planned into Washington Union Station. 2
However, Amtrak also expresses the following specific concerns on options presented in the DEIS. The first of these concerns relates to the operating and technical performance specifications underlying the improvements proposed.

Recognizing the operating constraints inherent in dense passenger operations on a heavy freight main line owned by a rail freight carrier (such as here on CSX's Richmond Line), Amtrak urges that consideration be made in the FEIS-phase analysis to the feasibility of introducing substantial segments of higher-performance (e.g., 110-mph operating speed design) new trackage, either adjacent or in the general vicinity of the existing CSX corridor south of Fredericksburg (e.g., Alternative Areas 4 and 5 in the DEIS). 3

The opportunity for new right-of-way sections would be particularly beneficial in the Ashland section (Alternative Area 5), where the option for a new bypass segment to the east of the community could overcome the severe constraints to higher-performance rail operations posed by the current street-level downtown alignment that could relieve the burden of heavy freight and passenger rail traffic operations through the center of this historic community. 4

AMTRAK (continued)

DRPT released its I-95 Southeast High Speed Rail Corridor & Service Plan, which set a goal of increasing passenger rail speed to a 90-mph maximum in the Washington, D.C. to Petersburg, VA corridor. In keeping with DRPT's 2009 Service Plan, the DC2RVA Project was designed to upgrade the reliability and service of conventional intercity rail services at speeds up to 90 mph, where practical, in a corridor shared with commuter and freight services. DRPT determined that a maximum speed of 90 mph, where feasible, for the DC2RVA Project provided the optimal capacity to improve service on the DC2RVA corridor while minimizing environmental impacts and costs. However, DRPT's determination that a maximum authorized speed of 90 mph for the passenger trains in the DC2RVA corridor does not preclude consideration in the future to increase the maximum allowable speed in the corridor. Additional details on the decisions that led to the selection of a maximum authorized speed of 90 mph in the Project corridor are provided in Section 1.2 of the Final EIS.

4. As work on the Tier II Draft EIS for the DC2RVA Project advanced, DRPT recognized that each of the proposed Build Alternatives would have potential adverse consequences on the citizens and resources of the Town of Ashland and/or Hanover County, and there was no local consensus or preference for a Build Alternative in this area. DRPT convened the Town of Ashland/Hanover County Community Advisory Committee (CAC) to review all previously considered options for greater rail capacity in the Ashland/Hanover County area, and to identify potential options that could meet the Purpose and Need of the DC2RVA Project, while also minimizing or avoiding potential impacts to the community and environment. Ultimately, the CAC identified three "least objectionable" alternatives for through-town, below-grade, and bypass options, which are fully described in Section 3.3 of the Final EIS and its Appendix G, and briefly summarized below:

21249

Amtrak Comments on DC2RVA Draft EIS Recommended Alternatives

The National Railroad Passenger Corporation ("Amtrak") is pleased to submit comments for the administrative record regarding the Federal Railroad Administration's ("FRA") and Virginia Department of Rail and Public Transportation ("DRPT")-sponsored Tier II Draft Environmental Impact Statement ("DEIS") for the Washington, DC to Richmond, VA ("DC2RVA") corridor element of the Washington, DC to Charlotte, NC Southeast High Speed Rail initiative (SEHSR).

Amtrak supports the stated Purpose and Need of the DC2RVA project to increase track capacity to allow greater passenger train speeds and frequencies to be operated on the Richmond-Washington section of the SEHSR in the state of Virginia, serving a projected service volume of 22 intercity, 17 commuter and between 10 and 20 freight round trips per day along the northernmost segment of this corridor.

Amtrak, as a partner with the State of Virginia, stands ready to expand to these projected levels of high-speed, regional and long-distance intercity passenger rail service south of Washington to the multiple destinations included in the draft service plans in the DC2RVA DEIS, contingent on available equipment and manpower.

Amtrak has been provided the DC2RVA draft service plan train times and frequency and will be evaluating how that can fit into our expansion and reconstruction plans for Washington Union Station along with those of the commuter rail operators. 1

Amtrak also reserves the right to perform its own network modeling to determine impacts to train performance based on the new levels of through DC2RVA service and the expanded VRE service frequency planned into Washington Union Station. 2

However, Amtrak also expresses the following specific concerns on options presented in the DEIS. The first of these concerns relates to the operating and technical performance specifications underlying the improvements proposed.

Recognizing the operating constraints inherent in dense passenger operations on a heavy freight main line owned by a rail freight carrier (such as here on CSX's Richmond Line), Amtrak urges that consideration be made in the FEIS-phase analysis to the feasibility of introducing substantial segments of higher-performance (e.g., 110-mph operating speed design) new trackage, either adjacent or in the general vicinity of the existing CSX corridor south of Fredericksburg (e.g., Alternative Areas 4 and 5 in the DEIS). 3

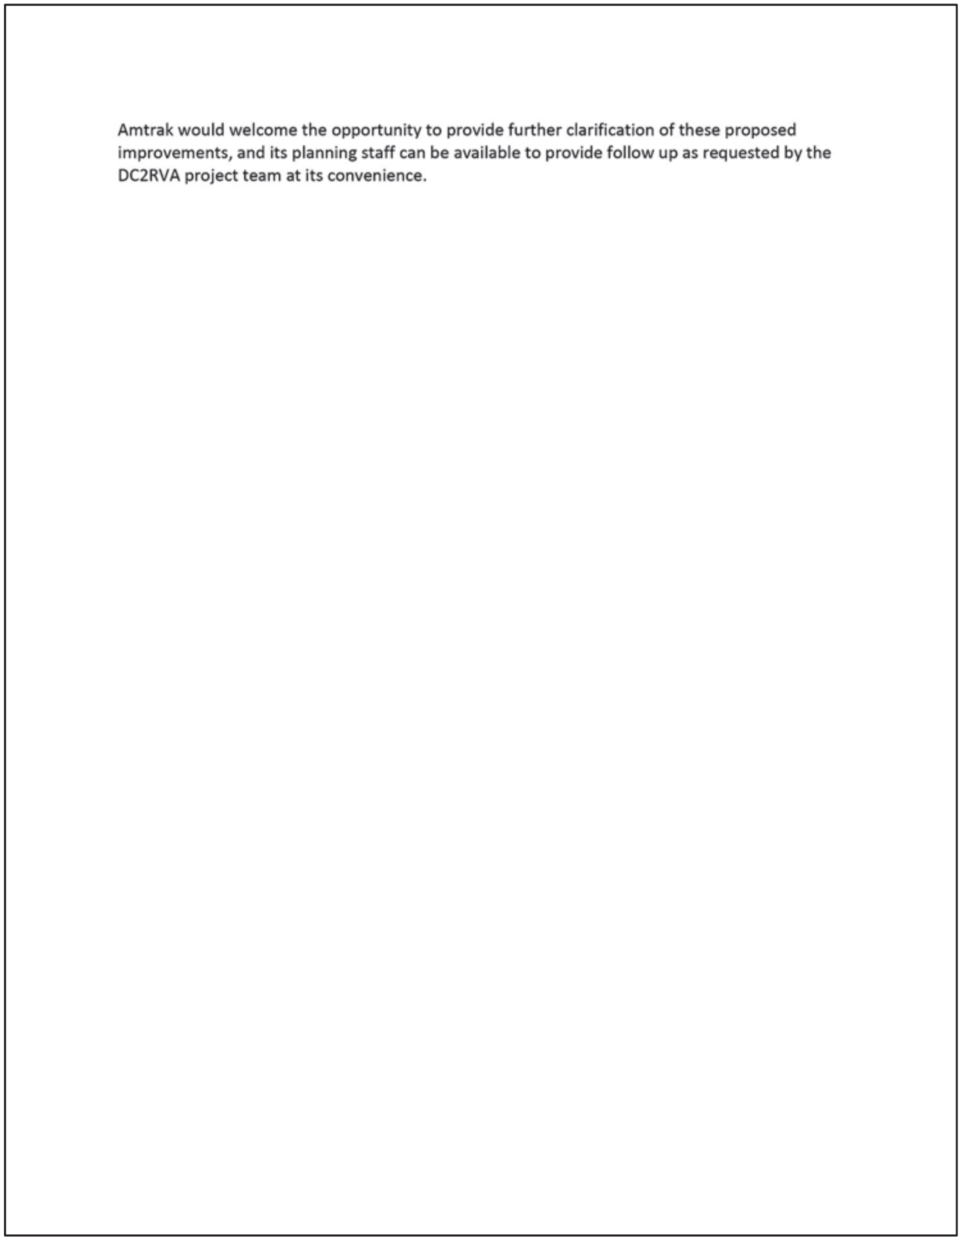
The opportunity for new right-of-way sections would be particularly beneficial in the Ashland section (Alternative Area 5), where the option for a new bypass segment to the east of the community could overcome the severe constraints to higher-performance rail operations posed by the current street-level downtown alignment that could relieve the burden of heavy freight and passenger rail traffic operations through the center of this historic community. 4

AMTRAK (continued)

- "3-2-3" Option (i.e., maintaining two tracks through Town): A third track would be added to the existing CSXT right-of-way north and south of the Town of Ashland, while the existing two tracks would remain in service through Ashland. This option is similar to Build Alternative 5A that was evaluated in the Draft EIS, with further minimization of infrastructure and associated potential impacts within downtown Ashland.
- Three-Track Trench: A trench would be constructed through Ashland approximately 50 feet wide and 33 feet deep. The two existing tracks through the Town of Ashland, along with a new third track, would pass through Ashland within the trench. This below-grade option followed a through-town alignment similar to Build Alternatives 5B and 5D as evaluated in the Draft EIS, but was considered and dismissed in the Draft EIS alternatives development process.
- Western Bypass Alignment: A two-track, grade-separated bypass approximately seven miles long would extend around the Town of Ashland to the west. This bypass alignment is similar to Build Alternative 5C as evaluated in the Draft EIS, but with a modified alignment. The AWB1 alignment was considered and dismissed in the Draft EIS alternatives development process.

The CAC's identification of least objectionable alternatives was intended to inform the final determination of a preferred alternative for the Ashland/Hanover County area by DRPT, the Commonwealth Transportation Board (CTB), and ultimately, FRA. In accordance with the September 2017 recommendation of the Town of Ashland/Hanover County Community Advisory Committee and the December 2017 resolution of the CTB, Alternative 5A was selected as the Preferred Alternative for the Ashland / Hanover area. Refer to Section 4.3.5 of the Final EIS for full description of the alternative and the basis for its selection.

Details of CAC activities are provided in the CAC Summary Report, which is Appendix G of the Final EIS.



Amtrak would welcome the opportunity to provide further clarification of these proposed improvements, and its planning staff can be available to provide follow up as requested by the DC2RVA project team at its convenience.

VRE

VIRGINIA RAILWAY EXPRESS

November 6, 2017

Via ELECTRONIC MAIL

Ms. Emily Stock
Manager of Rail Planning
Virginia Department of Rail and Public Transportation
600 East Main Street, Suite 2102
Richmond, VA 23219

Re: Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation Review

Dear Ms. Stock:

The Virginia Railway Express (VRE) has reviewed the *Southeast High Speed Rail Washington, DC to Richmond, Virginia, Tier II Draft Environmental Impact Statement and Draft Section 4 (f) Evaluation (DEIS)*. The DEIS contemplates improvements to the CSX Transportation (CSXT) RF&P Subdivision, many of which are in the VRE operating territory and would benefit VRE operations. Most notable are adding a fourth track between the Potomac River and Alexandria and completing a third track from Alexandria to north of Fredericksburg. The project also produced concept-level plans for a new third track across the Rappahannock River in the city of Fredericksburg.

As a stakeholder in the "DC2RVA" planning process, VRE staff worked closely with project staff throughout the development of DEIS document to ensure compatibility with VRE operations and designs for station improvements currently underway through the corridor. A Record of Decision from the Federal Railroad Administration for the DC2RVA project based on the DEIS will represent a major step towards additional corridor capacity and fluidity to the benefit of all users of the Subdivision.

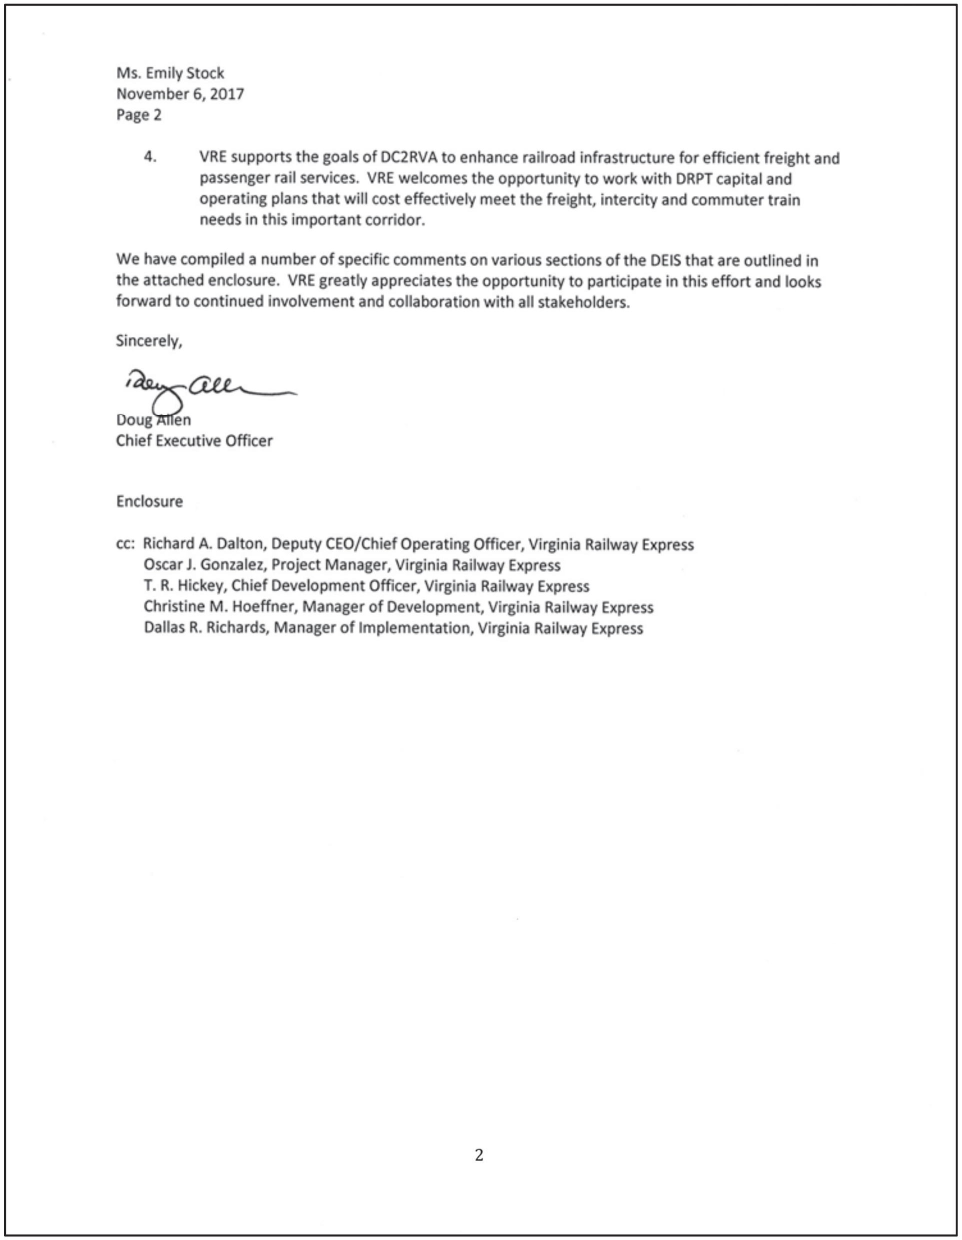
In summary:

1. VRE appreciates the overall DEIS effort conducted by the Virginia Department of Rail and Public Transportation (DRPT) and the collaboration with VRE and other stakeholders throughout the process.
2. VRE supports the conclusions of the DEIS that identify significant improvements to the railroad's physical plant that will benefit all users of the corridor—CSXT, Amtrak and VRE.
3. VRE has issues that we are eager to help resolve regarding technical design details of proposed additional tracks through VRE stations. We also have some questions with the noise and vibration impact analyses. These details are being actively addressed as part of the on-going coordination between the project teams, however, and we are confident that they will be resolved prior to the issuing the Final Environmental Statement.

VRE

Note DRPT responded to the specific comments in the attachment that are summarized in the first two pages of VREs letter. The response numbering below corresponds to the DRPT-numbered statements as indicated by the numbered black bars on the right side of the attachment to VRE's letter and is not intended to align with the letter summary numbering provided by VRE.

(No comments on this page)



Ms. Emily Stock
November 6, 2017
Page 2

4. VRE supports the goals of DC2RVA to enhance railroad infrastructure for efficient freight and passenger rail services. VRE welcomes the opportunity to work with DRPT capital and operating plans that will cost effectively meet the freight, intercity and commuter train needs in this important corridor.

We have compiled a number of specific comments on various sections of the DEIS that are outlined in the attached enclosure. VRE greatly appreciates the opportunity to participate in this effort and looks forward to continued involvement and collaboration with all stakeholders.

Sincerely,

Doug Allen
Chief Executive Officer

1 General comment: The projected timeline for completion appears inconsistent with level of work required. Consider reevaluating projected timeline for design, permitting, property acquisition, and construction.

2 General comment: There appear to be inconsistencies between design criteria and required construction especially as it pertains to VRE station locations.

3 p. 2-29 DC2RVA provides sufficient options to connect with potential Long Bridge alternatives. Continue coordination with DC2RVA, DDOT and FRA

4 p. 2-44 Table 2.5-1: add Crystal City and L'Enfant station improvements; replace GHX Extension with Broad Run Expansion

5 p. 2-46 "VRE Broad Run/Crossroads Yard Expansion" This may have been true when the DC2RVA project was begun. Not sure if need a change to this statement.

6 p. 2-47 "VRE Station Platform Expansion Program" Paragraph is generally correct. Last line gives timing for construction that have changed, probably because they based the timing on the SYP that they had at the time. Do we need to change statement?

7 p. 2-47 "VRE Station Platform Expansion Program" Bullet for VRE Alexandria Station states that "VRE will also improve the tunnel connecting the island platform to the main station for ADA accessibility". The project is to build a new ADA- compliant tunnel connecting the station to the Metro Station. The current statement does not reflect the station to station connection as depicted in Figure 2.5-3.

8 p. 2-55 Sec. 2.5.2.2 The first line states that the section "...extends from the Crystal City Station in Arlington County... ". Which Crystal City station is this referring to? Is it the VRE Crystal City Station which is not served by Amtrak?

9 p. 2-126 "Station Construction" does not indicate adjustments needed to any VRE stations. Will all the adjustments be built in to the VRE projects?

Noise and vibration:

10
- The DEIS Noise Technical Report (page 4-8), Table 4-4 indicates Moderate Noise Impacts at 7 Category 2 sensitive receptors in Arlington. The maps included with the report identify the sensitive receptors.
- There is also Table 5-1 Noise Impact Summary by Alternative (page 5-1) that lists 670 Moderate impacts and 99 Severe Impacts in Arlington. It is unclear to VRE the difference between the two tables but the numbers are significantly different. It is unclear the difference between Chapters 4 and 5 of the DC2RVA Noise report.

3

VRE (continued)

1. The Department of Rail and Public Transportation (DRPT) and the Federal Railroad Administration (FRA) acknowledge the implementation process that follows the guidelines of the National Environmental Policy Act (NEPA) and preliminary design can be lengthy, and includes applying for construction permits, equipment selection and manufacturing, ordering materials, and actual construction of the rail corridor improvements. DRPT and FRA have adopted an incremental approach to develop new service and are working with CSXT, the owner of the railroad, to identify key opportunities to construct railroad infrastructure and implement improved service in the corridor as quickly as possible. For planning purposes, DRPT and FRA assumed the earliest the new service could be in operation would be 2025; this assumption is based on a completed NEPA process and full funding being immediately available. The build-out of the corridor and full implementation of the DC2RVA Project is dependent on future state and federal funding. Full details about future steps in the Project process, including funding, implementation and service priorities, final design, permitting, and construction, are included in Chapter 7 of this Final Environmental Impact Statement (EIS), which has been added since the Draft EIS to address these topics.
2. The design criteria for the DC2RVA Project apply to intercity passenger rail stations providing service to Amtrak, and including stations shared by Amtrak and the Virginia Railway Express (VRE). Adjustments to VRE stations are being coordinated between VRE and DRPT, separate from the DC2RVA Project. Application of the design criteria at stations solely serving VRE is limited to the track horizontal offset distance from VRE platforms and to the track elevation relative to the VRE platforms. Additional track or track realignments constructed under the DC2RVA Project will support the planned platform improvements at stations served by VRE. DRPT will continue coordinating with VRE to ensure proposed track improvements under DC2RVA align with VRE's ongoing and planned station expansion projects.

It is unclear to VRE the difference between the two tables but the numbers are significantly different. It is unclear the difference between Chapters 4 and 5 of the DC2RVA Noise report.

3

VRE (continued)

3. Comment noted. DRPT will continue to coordinate with FRA, the District Department of Transportation (DDOT), and other stakeholders on the Long Bridge project throughout the DC2RVA design process.

4. Draft EIS Table 2.5-1 has been updated as requested; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS. Note that the Broad Run expansion is in the Draft EIS Table 2.5-1, so no addition is needed.

5. and 6. DRPT acknowledges that VRE's most recent plans and construction timelines for the two referenced projects have been revised since publication of the Draft EIS. Clarification of any effects from revised plans or construction timelines are addressed in Section 4.4.2 and Section 7.7 of the Final EIS.

7. The text has been corrected to reflect that the proposed new pedestrian tunnel would connect Alexandria Union Station to the King Street Metro Station and provide access to the platforms and station that are compliant with the Americans with Disabilities Act (ADA); refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

8. The referenced description has been updated to indicate that it refers to VRE's Crystal City Station. Refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

9. See DRPT-numbered statement #2 above for response.

3 p. 2-29 DC2RVA provides sufficient options to connect with potential Long Bridge alternatives. Continue coordination with DC2RVA, DDOT and FRA

4 p. 2-44 Table 2.5-1: add Crystal City and L'Enfant station improvements; replace GHX Extension with Broad Run Expansion

5 p. 2-46 "VRE Broad Run/Crossroads Yard Expansion" This may have been true when the DC2RVA project was begun. Not sure if need a change to this statement.

6 p. 2-47 "VRE Station Platform Expansion Program" Paragraph is generally correct. Last line gives timing for construction that have changed, probably because they based the timing on the SYP that they had at the time. Do we need to change statement?

7 p. 2-47 "VRE Station Platform Expansion Program" Bullet for VRE Alexandria Station states that "VRE will also improve the tunnel connecting the island platform to the main station for ADA accessibility". The project is to build a new ADA- compliant tunnel connecting the station to the Metro Station. The current statement does not reflect the station to station connection as depicted in Figure 2.5-3.

8 p. 2-55 Sec. 2.5.2.2 The first line states that the section "...extends from the Crystal City Station in Arlington County... ". Which Crystal City station is this referring to? Is it the VRE Crystal City Station which is not served by Amtrak?

9 p. 2-126 "Station Construction" does not indicate adjustments needed to any VRE stations. Will all the adjustments be built in to the VRE projects?

Noise and vibration:

10
- The DEIS Noise Technical Report (page 4-8), Table 4-4 indicates Moderate Noise Impacts at 7 Category 2 sensitive receptors in Arlington. The maps included with the report identify the sensitive receptors.
- There is also Table 5-1 Noise Impact Summary by Alternative (page 5-1) that lists 670 Moderate impacts and 99 Severe Impacts in Arlington. It is unclear to VRE the difference between the two tables but the numbers are significantly different. It is unclear the difference between Chapters 4 and 5 of the DC2RVA Noise report.

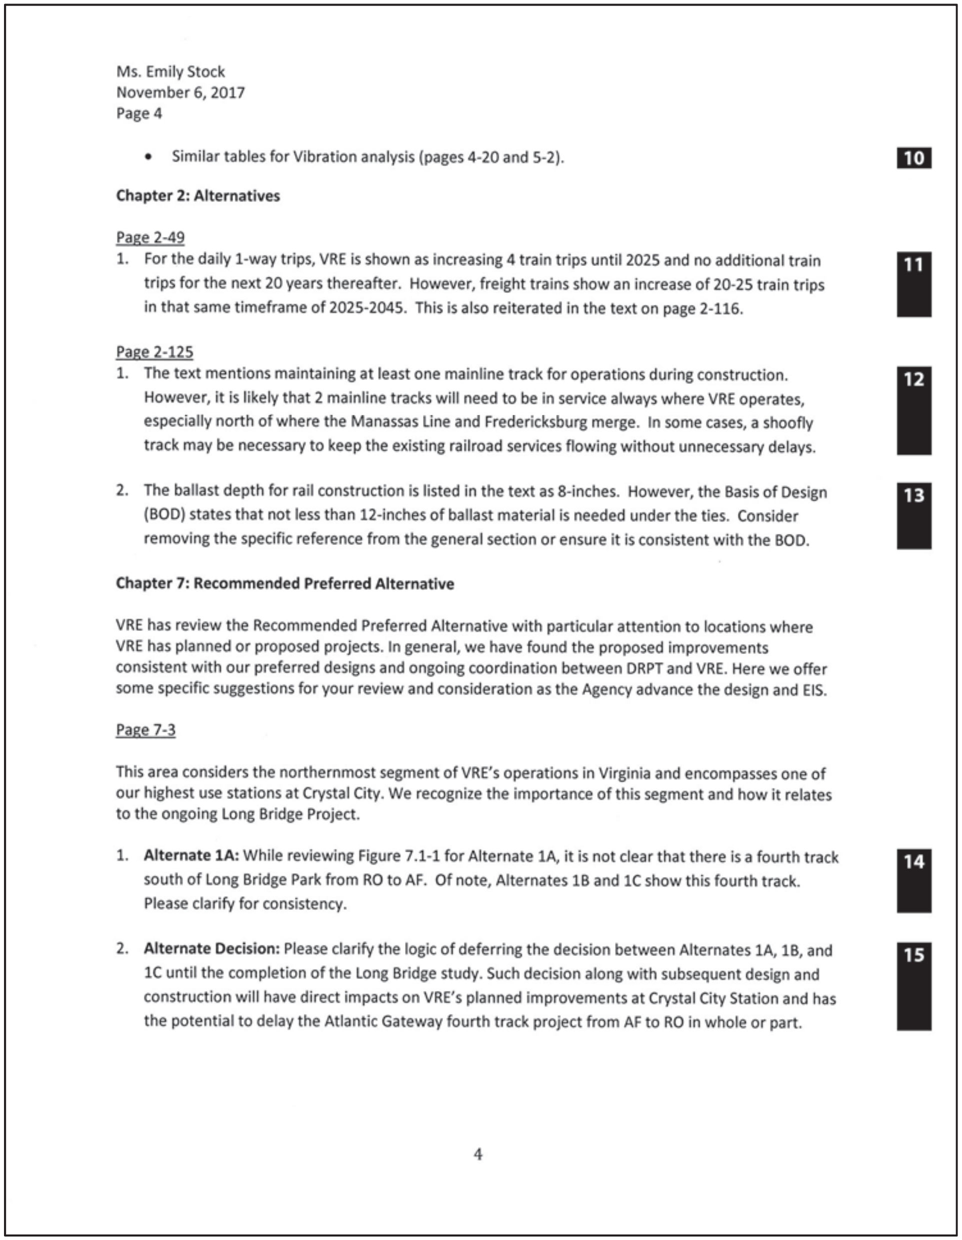
3

VRE (continued)

10. Table 4-4 in the Noise and Vibration Technical report (Appendix P in the Draft EIS) presents noise analysis results for Build Alternative 2A in the Northern Virginia segment (Area 2) of the DC2RVA corridor. Build Alternative 2A is the only Build Alternative for the Northern Virginia segment. Draft EIS Table 5-1 summarizes noise impacts for all six corridor segments and all of the Project Build Alternatives. The results for Build Alternative 2A are the same in both tables. Draft EIS Table 4-4 identifies noise impacts in each major municipality per Area, whereas Draft EIS Table 5-1 simply presents the total number of projected noise impacts per Area (all municipalities in that segment). Information on potential vibration effects are presented in the same manner.

    There are no changes to the vibration impact contours or noise impact contours since the publication of the Draft EIS, with the exception of two areas for noise only (one location in Crystal City in Arlington and one location in Richmond); these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS.

    The noise analysis tables in Section 5.7 of the Final EIS are presented for only the defined contiguous Preferred Alternative through all six area segments of the Project corridor.



Ms. Emily Stock
November 6, 2017
Page 4

- Similar tables for Vibration analysis (pages 4-20 and 5-2). **10**

Chapter 2: Alternatives

Page 2-49

1. For the daily 1-way trips, VRE is shown as increasing 4 train trips until 2025 and no additional train trips for the next 20 years thereafter. However, freight trains show an increase of 20-25 train trips in that same timeframe of 2025-2045. This is also reiterated in the text on page 2-116. **11**

Page 2-125

1. The text mentions maintaining at least one mainline track for operations during construction. However, it is likely that 2 mainline tracks will need to be in service always where VRE operates, especially north of where the Manassas Line and Fredericksburg merge. In some cases, a shoofly track may be necessary to keep the existing railroad services flowing without unnecessary delays. **12**

2. The ballast depth for rail construction is listed in the text as 8-inches. However, the Basis of Design (BOD) states that not less than 12-inches of ballast material is needed under the ties. Consider removing the specific reference from the general section or ensure it is consistent with the BOD. **13**

Chapter 7: Recommended Preferred Alternative

VRE has review the Recommended Preferred Alternative with particular attention to locations where VRE has planned or proposed projects. In general, we have found the proposed improvements consistent with our preferred designs and ongoing coordination between DRPT and VRE. Here we offer some specific suggestions for your review and consideration as the Agency advance the design and EIS.

Page 7-3

This area considers the northernmost segment of VRE's operations in Virginia and encompasses one of our highest use stations at Crystal City. We recognize the importance of this segment and how it relates to the ongoing Long Bridge Project.

1. **Alternate 1A:** While reviewing Figure 7.1-1 for Alternate 1A, it is not clear that there is a fourth track south of Long Bridge Park from RO to AF. Of note, Alternates 1B and 1C show this fourth track. Please clarify for consistency. **14**

2. **Alternate Decision:** Please clarify the logic of deferring the decision between Alternates 1A, 1B, and 1C until the completion of the Long Bridge study. Such decision along with subsequent design and construction will have direct impacts on VRE's planned improvements at Crystal City Station and has the potential to delay the Atlantic Gateway fourth track project from AF to RO in whole or part. **15**

4

VRE (continued)

(Response to comment 10 on previous page)

11. No Build assumptions regarding projected increases in freight, intercity passenger, and commuter rail service frequencies were developed in consultation with FRA, CSXT, Amtrak, and VRE. The DC2RVA Project does not preclude the development of additional rail capacity projects to accommodate future increases in rail traffic as future service plans and market conditions change. Separate from the Purpose and Need of the DC2RVA Project, DRPT and FRA also recognize that CSXT, VRE, or other interested parties may pursue additional capital improvements (or service changes) along the DC2RVA corridor between Washington, D.C. and Centralia, VA or on the adjacent railroad network that would affect the operations within the Project corridor. Additional operations analysis performed through the life of the DC2RVA Project will include any modifications to the railroad network constructed (or service changes implemented) by others to continue to validate that the infrastructure defined in the EIS for the DC2RVA Project remains effective to meet the Purpose and Need of Project.
12. The referenced text is part of a general statement about maintaining operations throughout the DC2RVA corridor, and does not preclude the need to maintain more than one track in operation. VRE's description of locations where more than one track would need to remain in service is noted.
13. The referenced text was revised, as requested, to clearly indicate a minimum of 12 inches of ballast would be required under the ties; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.
14. Build Alternative 1A, as evaluated in the Draft EIS, proposes four mainline tracks between RO and AF; however, the referenced Draft EIS Figure 7.1-1 was intended as a high-level graphical preview of the Recommended Preferred Alternative at that time, and is not included as part of the Final EIS document. Rather, the Final EIS provides an updated detailed mapbook of the Preferred Alternative in Appendix L. Note that subsequent to the Draft EIS, Alternative 1B was selected as the Preferred Alternative for the Arlington Bridge Approach (refer to Final EIS Section 4.3.1).

(Responses are continued on next page)

Page 2-125

1. The text mentions maintaining at least one mainline track for operations during construction. However, it is likely that 2 mainline tracks will need to be in service always where VRE operates, especially north of where the Manassas Line and Fredericksburg merge. In some cases, a shoofly track may be necessary to keep the existing railroad services flowing without unnecessary delays. 12
2. The ballast depth for rail construction is listed in the text as 8-inches. However, the Basis of Design (BOD) states that not less than 12-inches of ballast material is needed under the ties. Consider removing the specific reference from the general section or ensure it is consistent with the BOD. 13

Chapter 7: Recommended Preferred Alternative

VRE has review the Recommended Preferred Alternative with particular attention to locations where VRE has planned or proposed projects. In general, we have found the proposed improvements consistent with our preferred designs and ongoing coordination between DRPT and VRE. Here we offer some specific suggestions for your review and consideration as the Agency advance the design and EIS.

Page 7-3

This area considers the northernmost segment of VRE's operations in Virginia and encompasses one of our highest use stations at Crystal City. We recognize the importance of this segment and how it relates to the ongoing Long Bridge Project.

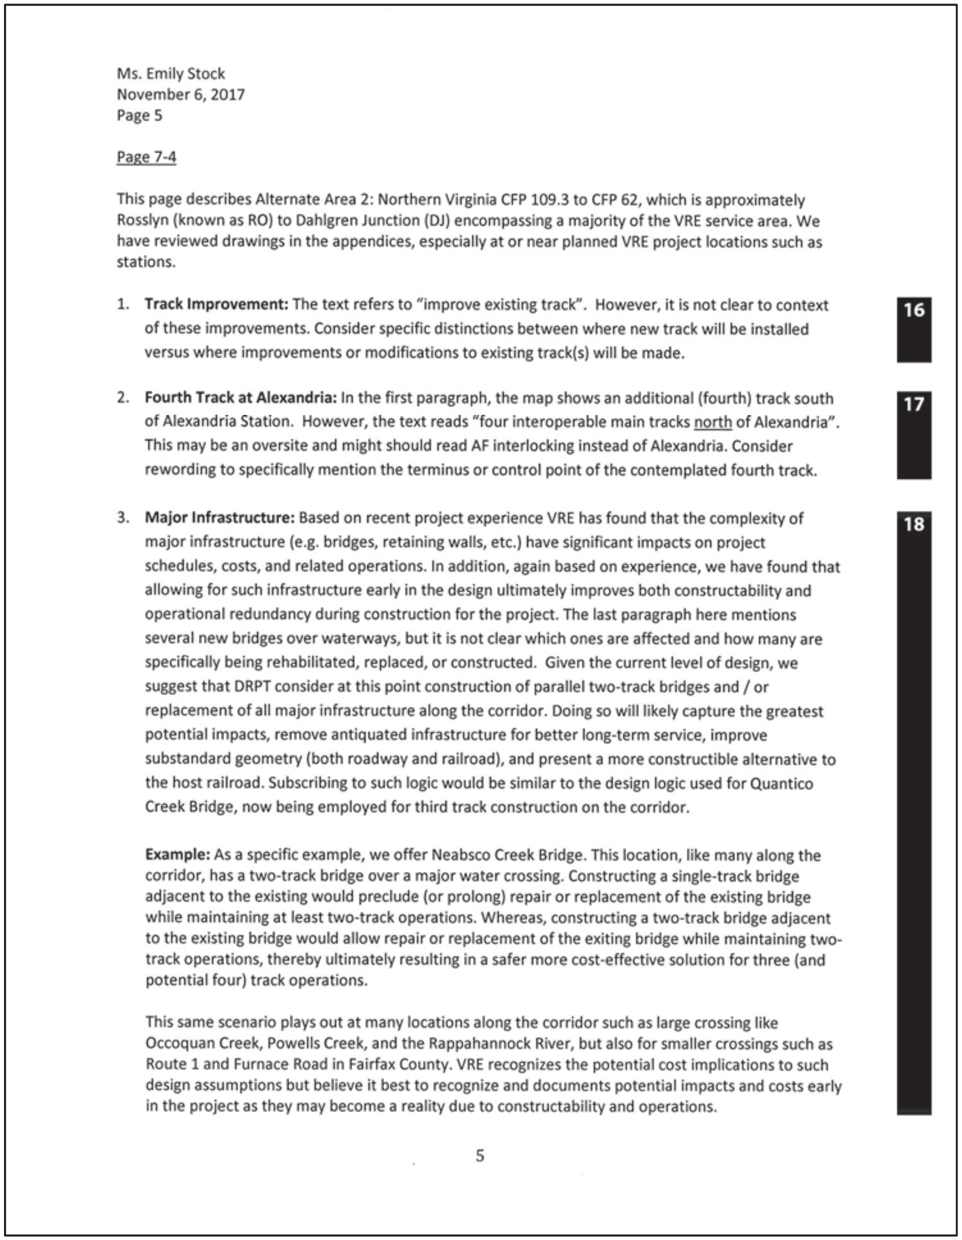
1. **Alternate 1A:** While reviewing Figure 7.1-1 for Alternate 1A, it is not clear that there is a fourth track south of Long Bridge Park from RO to AF. Of note, Alternates 1B and 1C show this fourth track. Please clarify for consistency. 14
2. **Alternate Decision:** Please clarify the logic of deferring the decision between Alternates 1A, 1B, and 1C until the completion of the Long Bridge study. Such decision along with subsequent design and construction will have direct impacts on VRE's planned improvements at Crystal City Station and has the potential to delay the Atlantic Gateway fourth track project from AF to RO in whole or part. 15

4

VRE (continued)

15. In the Draft EIS, to avoid unnecessarily constraining the possible alternatives of the separate Long Bridge project, FRA and DRPT identified and evaluated three possible configurations for the one-mile section of the DC2RVA corridor in Arlington, without recommendation of a preferred alternative between them at that time. Note that there is no requirement for a Draft EIS to recommend a preferred alternative. Subsequently, Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative for the DC2RVA Project to align with the two alternatives that were recommended in the Long Bridge Alternatives Report. Refer to Final EIS Section 4.3.1 for details on the selection process and description of Preferred Alternative 1B. DRPT will continue to coordinate with the Long Bridge project to ensure a smooth transition to the proposed new Long Bridge.

    The corridor segment south of the bridge approach will be implemented as part of the Atlantic Gateway project and will include positioning of rail to accommodate appropriate transition to the bridge approach (regardless of location). This will allow VRE's proposed improvements at Crystal City Station to proceed with two tracks in service at all times.



Ms. Emily Stock
November 6, 2017
Page 5

Page 7-4

This page describes Alternate Area 2: Northern Virginia CFP 109.3 to CFP 62, which is approximately Rosslyn (known as RO) to Dahlgren Junction (DJ) encompassing a majority of the VRE service area. We have reviewed drawings in the appendices, especially at or near planned VRE project locations such as stations.

1. **Track Improvement:** The text refers to "improve existing track". However, it is not clear to context of these improvements. Consider specific distinctions between where new track will be installed versus where improvements or modifications to existing track(s) will be made. **16**

2. **Fourth Track at Alexandria:** In the first paragraph, the map shows an additional (fourth) track south of Alexandria Station. However, the text reads "four interoperable main tracks north of Alexandria". This may be an oversite and might should read AF interlocking instead of Alexandria. Consider rewording to specifically mention the terminus or control point of the contemplated fourth track. **17**

3. **Major Infrastructure:** Based on recent project experience VRE has found that the complexity of major infrastructure (e.g. bridges, retaining walls, etc.) have significant impacts on project schedules, costs, and related operations. In addition, again based on experience, we have found that allowing for such infrastructure early in the design ultimately improves both constructability and operational redundancy during construction for the project. The last paragraph here mentions several new bridges over waterways, but it is not clear which ones are affected and how many are specifically being rehabilitated, replaced, or constructed. Given the current level of design, we suggest that DRPT consider at this point construction of parallel two-track bridges and / or replacement of all major infrastructure along the corridor. Doing so will likely capture the greatest potential impacts, remove antiquated infrastructure for better long-term service, improve substandard geometry (both roadway and railroad), and present a more constructible alternative to the host railroad. Subscribing to such logic would be similar to the design logic used for Quantico Creek Bridge, now being employed for third track construction on the corridor. **18**

   Example: As a specific example, we offer Neabsco Creek Bridge. This location, like many along the corridor, has a two-track bridge over a major water crossing. Constructing a single-track bridge adjacent to the existing would preclude (or prolong) repair or replacement of the existing bridge while maintaining at least two-track operations. Whereas, constructing a two-track bridge adjacent to the existing bridge would allow repair or replacement of the exiting bridge while maintaining two-track operations, thereby ultimately resulting in a safer more cost-effective solution for three (and potential four) track operations.

   This same scenario plays out at many locations along the corridor such as large crossing like Occoquan Creek, Powells Creek, and the Rappahannock River, but also for smaller crossings such as Route 1 and Furnace Road in Fairfax County. VRE recognizes the potential cost implications to such design assumptions but believe it best to recognize and documents potential impacts and costs early in the project as they may become a reality due to constructability and operations.

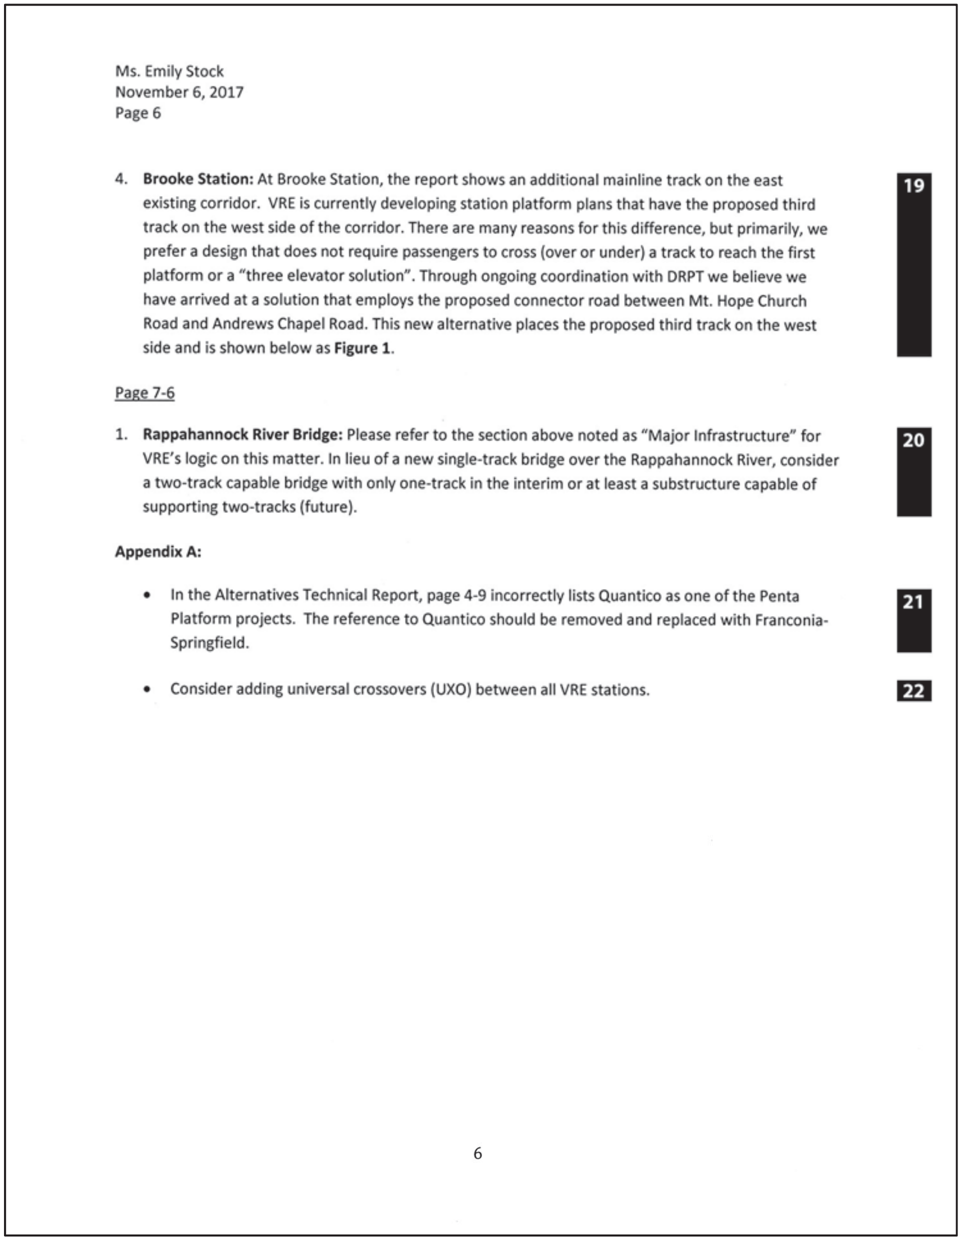
5

VRE (continued)

16. The referenced Figure 7.2-1 on page 7-4 of the Draft EIS was intended as a high-level graphical preview of the Recommended Preferred Alternative at that time and is not included as part of the Final EIS document. Rather, the Final EIS provides updated detailed descriptions and mapbooks of the Preferred Alternative Refer in Section 4.3 and Appendix L, respectively.

17. The referenced section was reworded for clarity, to read "…with four interoperable main tracks north of AF interlocking and three interoperable main tracks from AF interlocking to Fredericksburg"; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

18. The DC2RVA Project's stated Purpose is to increase railroad capacity between Washington, D.C. and Richmond, VA to deliver higher speed passenger rail service, while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. DRPT and FRA are committed to including sufficient infrastructure improvements in the DC2RVA Project to support the Purpose and Need – however, the goal of the Project is not to re-build the entire CSXT corridor, but to add necessary infrastructure. CSXT has certified that their existing rail bridges meet all necessary engineering and safety standards, and replacement of existing rail bridges is not proposed unless directly necessary to meet the Purpose and Need. The DC2RVA Project's major bridge conceptual designs and environmental impact evaluations address a sub-structure sufficient to support a two-track bridge, although the preliminary Project designs would only show a single-track bridge. This allows for an evaluation of the two-track bridge sub-structure and in-water impacts under NEPA and ensures future design flexibility, while limiting the Project's proposed infrastructure and costs to that necessary to meet Purpose and Need.



4. **Brooke Station:** At Brooke Station, the report shows an additional mainline track on the east existing corridor. VRE is currently developing station platform plans that have the proposed third track on the west side of the corridor. There are many reasons for this difference, but primarily, we prefer a design that does not require passengers to cross (over or under) a track to reach the first platform or a "three elevator solution". Through ongoing coordination with DRPT we believe we have arrived at a solution that employs the proposed connector road between Mt. Hope Church Road and Andrews Chapel Road. This new alternative places the proposed third track on the west side and is shown below as **Figure 1**. 19

Page 7-6

1. **Rappahannock River Bridge:** Please refer to the section above noted as "Major Infrastructure" for VRE's logic on this matter. In lieu of a new single-track bridge over the Rappahannock River, consider a two-track capable bridge with only one-track in the interim or at least a substructure capable of supporting two-tracks (future). 20

Appendix A:

- In the Alternatives Technical Report, page 4-9 incorrectly lists Quantico as one of the Penta Platform projects. The reference to Quantico should be removed and replaced with Franconia-Springfield. 21
- Consider adding universal crossovers (UXO) between all VRE stations. 22

VRE (continued)

19. DRPT remains committed to working with VRE and other stakeholders for the duration of the Project. VRE's proposed solution as shown in Figure 1 in the comments is noted.

20. Refer to DRPT-numbered statement #18 above for response.

21. By way of this response, DRPT acknowledges that the Franconia-Springfield station will replace the Quantico station on page 4-9 of the Alternatives Technical Report (Appendix A of the Draft EIS), under the Penta Platform projects description.

22. DRPT worked with FRA and CSXT to determine reasonable conceptual location of rail crossovers; final determinations will be developed during development of the Corridor Service Development Plan (SDP) for this Project (refer to Section 7.3 of the Final EIS for details) as well as during final design of signals and communication.

Richmond, VA 23219

Dear Ms. Stock:

On behalf of the Washington Metropolitan Area Transit Authority (WMATA), I am transmitting the Authority's comments on the Washington, DC to Richmond (DC2RVA) Tier II Draft Environmental Impact Statement (DEIS).

WMATA supports the development of the DC2RVA project but we also want to highlight the importance of advancing the Long Bridge Project, which would greatly enhance the prospects for DC2RVA and other passenger rail services in this corridor. Please ensure that both of these projects are coordinated and advanced in concert with one another. **1**

We want to take the opportunity to highlight several points for DRPT should consider as this important project advances.

1. Although the DC2RVA project is still in the early phases of engineering and environmental review, there may be several challenges and project risks if WMATA facilities and operations are impacted. All construction actions within the "zone of influence," must be coordinated with WMATA's Joint Development and Adjacent Construction (JDAC) Office and approved by WMATA. The "zone of influence" is defined in Section 3.1 of WMATA's JDAC Project Manual, which can be found on the JDAC website via the link below. Coordination can add significant time and cost to a major projects and if the project is likely to impact WMATA facilities, we recommend documenting the potential impact and coordinating with WMATA early and often to avoid or mitigate the impact. The JDAC website can be found here for review: www.wmata.com/about/business/adjacent-construction/index.cfm. **2**
2. The City of Alexandria and WMATA are constructing a new Metrorail station in Potomac Yard. The DC2RVA project should not impact existing plans to construct the new station. Currently a design-build contract to implement the project is being evaluated by the City of Alexandria and WMATA. More information can be found on the project website: www.potomacyardmetro.com **3**

WMATA

1. The Department of Rail and Public Transportation (DRPT) is currently working with the District Department of Transportation (DDOT) and the Federal Railroad Administration (FRA) to evaluate possible alternatives for increasing the rail corridor's capacity across the Potomac River via Long Bridge as part of a separate environmental study (the Long Bridge study), for which DRPT is a cooperating agency. In the Draft Environmental Impact Statement (EIS) for the DC2RVA Project, to avoid unnecessarily constraining the possible alternatives of the separate Long Bridge study, FRA and DRPT identified and evaluated three possible configurations for the one-mile section of the DC2RVA corridor in Arlington, without recommendation of a preferred alternative between them at that time. Subsequently, Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative for the DC2RVA Project to align with the two alternatives that were recommended in the Long Bridge Alternatives Report. Refer to Final EIS Section 4.3.1 for details on the selection process and description of Preferred Alternative 1B. DRPT will continue to coordinate with the Long Bridge project to ensure a smooth transition to the proposed new Long Bridge.

Ms. Emily Stock
Virginia Department of Rail and Public Transportation (DRPT)
600 East Main Street
Suite 2102
Richmond, VA 23219

Dear Ms. Stock:

On behalf of the Washington Metropolitan Area Transit Authority (WMATA), I am transmitting the Authority's comments on the Washington, DC to Richmond (DC2RVA) Tier II Draft Environmental Impact Statement (DEIS).

WMATA supports the development of the DC2RVA project but we also want to highlight the importance of advancing the Long Bridge Project, which would greatly enhance the prospects for DC2RVA and other passenger rail services in this corridor. Please ensure that both of these projects are coordinated and advanced in concert with one another. 1

We want to take the opportunity to highlight several points for DRPT should consider as this important project advances.

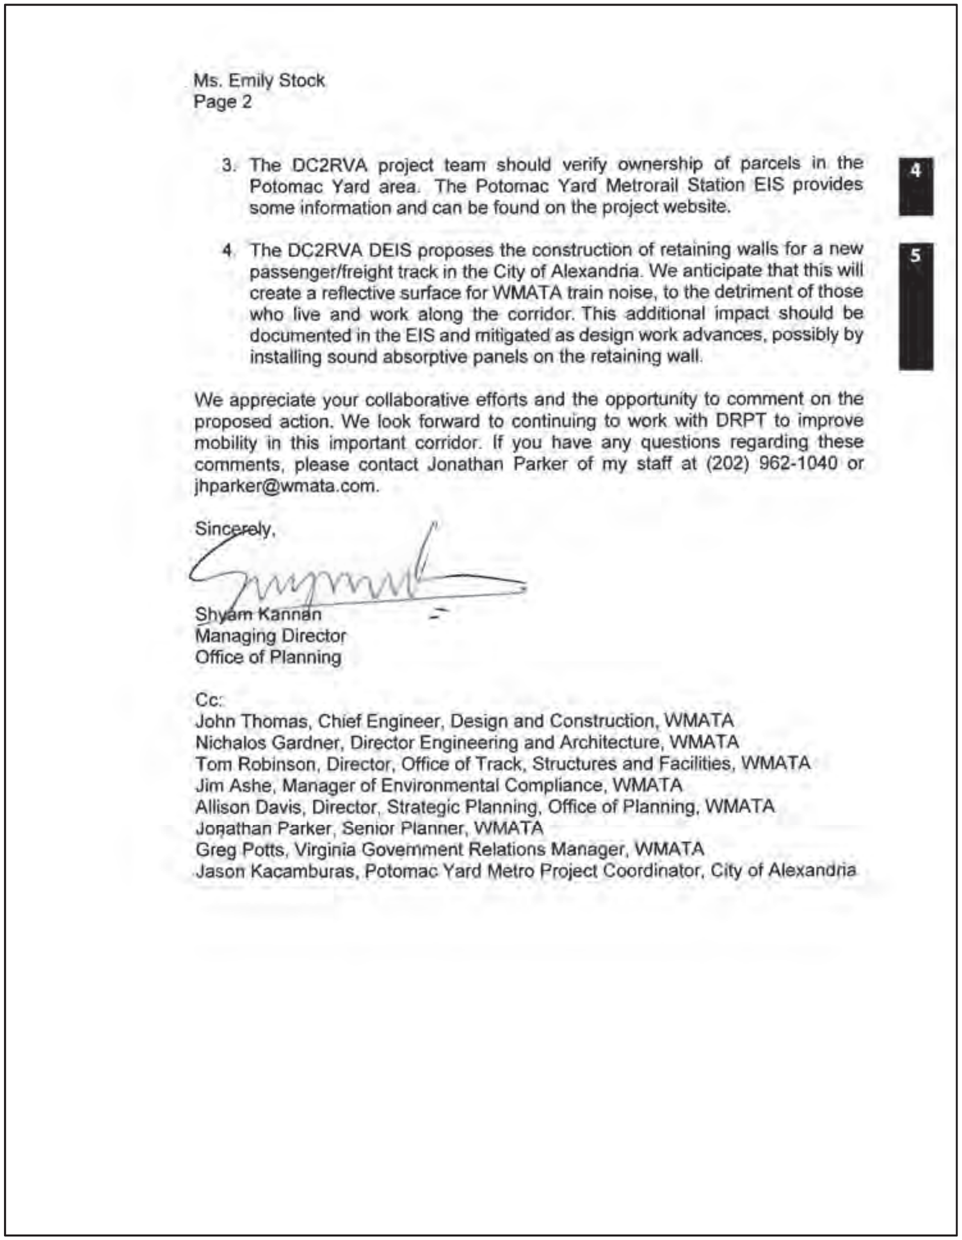
1. Although the DC2RVA project is still in the early phases of engineering and environmental review, there may be several challenges and project risks if WMATA facilities and operations are impacted. All construction actions within the "zone of influence," must be coordinated with WMATA's Joint Development and Adjacent Construction (JDAC) Office and approved by WMATA. The "zone of influence" is defined in Section 3.1 of WMATA's JDAC Project Manual, which can be found on the JDAC website via the link below. Coordination can add significant time and cost to a major projects and if the project is likely to impact WMATA facilities, we recommend documenting the potential impact and coordinating with WMATA early and often to avoid or mitigate the impact. The JDAC website can be found here for review: www.wmata.com/about/business/adjacent-construction/index.cfm. 2
2. The City of Alexandria and WMATA are constructing a new Metrorail station in Potomac Yard. The DC2RVA project should not impact existing plans to construct the new station. Currently a design-build contract to implement the project is being evaluated by the City of Alexandria and WMATA. More information can be found on the project website: www.potomacyardmetro.com 3

WMATA (continued)

(Response to comment 1 on previous page)

2. Comment noted. The design of the DC2RVA Project in support of the Draft and Final EIS is at a conceptual level of engineering, as appropriate for decisions to be made as part of the National Environmental Policy Act (NEPA) process. Potential impacts have been identified based on this conceptual engineering, as reported in Chapter 5 of the Final EIS for the Preferred Alternative. No permanent impacts to Washington Metropolitan Area Transit Authority (WMATA) properties or operations have been identified based on the engineering to date, as all proposed track improvements will stay within the existing right-of-way at the King Street Metrorail Station location. However, there may be temporary impacts within the WMATA right-of-way associated with the construction of the proposed fourth track, but these impacts will not affect WMATA operations and may be eliminated in the next phase of design. DRPT is committed to working with WMATA and other stakeholders to further address potential Project effects during final design, after funding becomes available and incremental improvements are scheduled.

3. Based on WMATA information to date, the DC2RVA Project is not anticipated to impact WMATA's proposed Potomac Yard Metrorail Station. The permanent impacts of the DC2RVA Project are planned to remain within CSXT right-of-way at the Potomac Yard Metrorail Station, and the temporary impacts of the DC2RVA Project are planned to remain within City of Alexandria property at this location; the detailed mapbooks of the Preferred Alternative, which are provided as Appendix L of the Final EIS, show both the permanent and temporary limits of disturbance. DRPT will continue to coordinate with WMATA during DC2RVA final design, which would occur as funding becomes available and incremental improvements are scheduled. Further coordination between DRPT, CSXT, Virginia Railway Express (VRE), and WMATA will be required to determine construction sequence and potential infrastructure that could benefit both projects.



Ms. Emily Stock
Page 2

3. The DC2RVA project team should verify ownership of parcels in the Potomac Yard area. The Potomac Yard Metrorail Station EIS provides some information and can be found on the project website. 4

4. The DC2RVA DEIS proposes the construction of retaining walls for a new passenger/freight track in the City of Alexandria. We anticipate that this will create a reflective surface for WMATA train noise, to the detriment of those who live and work along the corridor. This additional impact should be documented in the EIS and mitigated as design work advances, possibly by installing sound absorptive panels on the retaining wall. 5

We appreciate your collaborative efforts and the opportunity to comment on the proposed action. We look forward to continuing to work with DRPT to improve mobility in this important corridor. If you have any questions regarding these comments, please contact Jonathan Parker of my staff at (202) 962-1040 or jhparker@wmata.com.

Sincerely,

Shyam Kannan

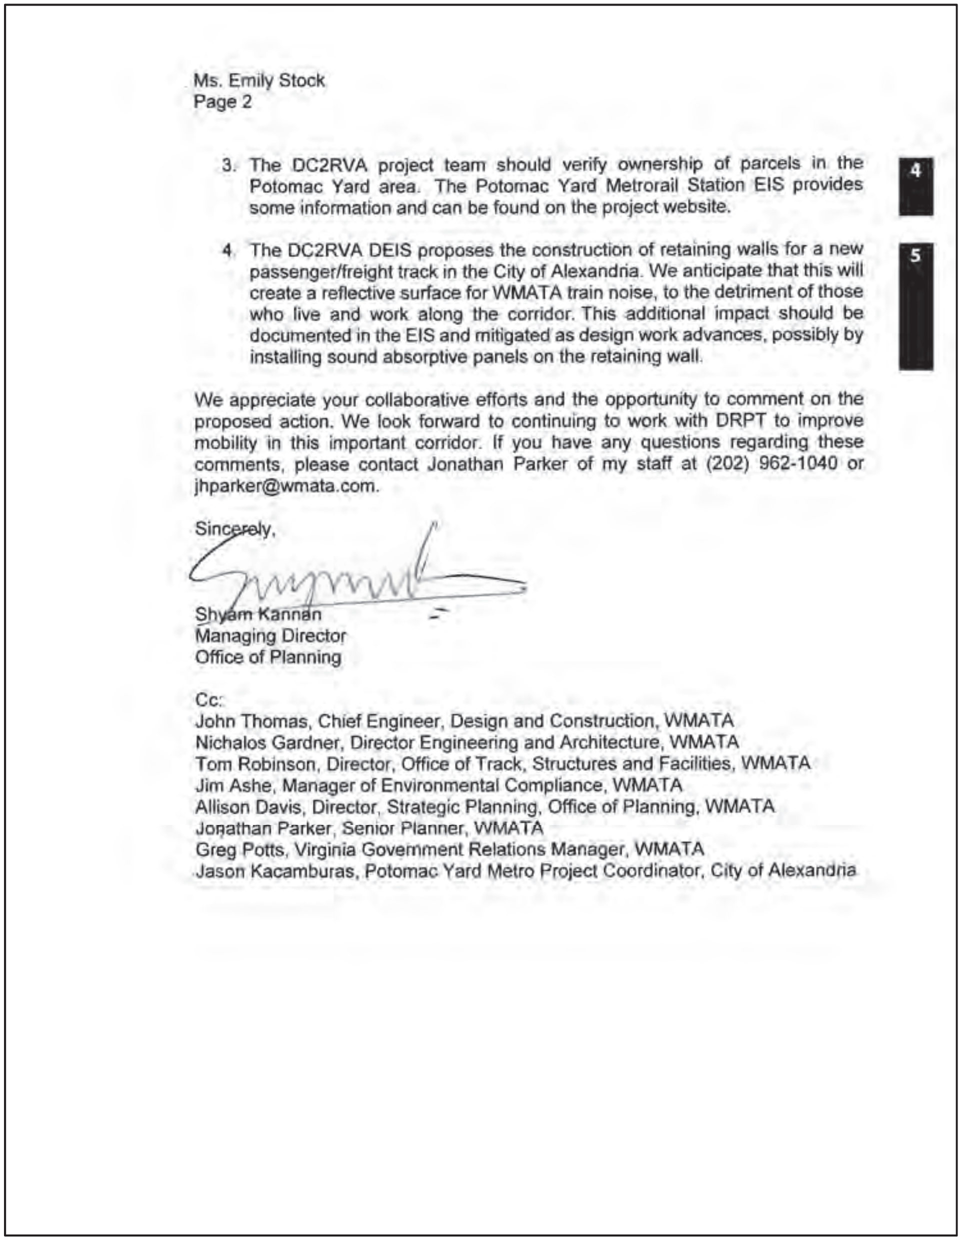
Jonathan Parker, Senior Planner, WMATA
Greg Potts, Virginia Government Relations Manager, WMATA
Jason Kacamburas, Potomac Yard Metro Project Coordinator, City of Alexandria

WMATA (continued)

4. Right-of-way and relocations for the Preferred Alternative are presented in Section 5.11.4 of the Final EIS. For purposes of the Draft and Final EIS evaluations, ownership of all parcels along the Project corridor was determined from individual jurisdiction databases. DRPT, in coordination with VDOT, made the determinations of potential permanent and temporary property acquisition based on conceptual engineering and parcel boundary data provided by the individual jurisdictions. The right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, would be conducted by VDOT in accordance with Federal and state regulations and would occur during future design stages of the Project

   The right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, will be conducted by the Virginia Department of Transportation (VDOT) in accordance with federal and state regulations following final design of this segment of the corridor. Final design will also include additional survey of parcel boundaries, and greater precision in determining property acquisition needs, if needed. DRPT will continue to coordinate with WMATA during DC2RVA final design, which would occur as funding becomes available and incremental improvements are scheduled in the Potomac Yards area.

(Responses are continued on next page)



Ms. Emily Stock
Page 2

3. The DC2RVA project team should verify ownership of parcels in the Potomac Yard area. The Potomac Yard Metrorail Station EIS provides some information and can be found on the project website. **4**

4. The DC2RVA DEIS proposes the construction of retaining walls for a new passenger/freight track in the City of Alexandria. We anticipate that this will create a reflective surface for WMATA train noise, to the detriment of those who live and work along the corridor. This additional impact should be documented in the EIS and mitigated as design work advances, possibly by installing sound absorptive panels on the retaining wall. **5**

We appreciate your collaborative efforts and the opportunity to comment on the proposed action. We look forward to continuing to work with DRPT to improve mobility in this important corridor. If you have any questions regarding these comments, please contact Jonathan Parker of my staff at (202) 962-1040 or jhparker@wmata.com.

WMATA (continued)

5. DRPT acknowledges that retaining walls may be constructed in this location, however, the exact size and location will not be developed until final design. As part of the Draft EIS noise assessments, DRPT evaluated the potential effects of the retaining walls on noise and concluded that the retaining walls would not substantively increase noise impacts. If the surface of a retaining wall was perfectly acoustically reflective, the reflection would be a mirror image of the original noise source (the train pass-by). When two identical noise sources are added together, the resulting increase is 3 decibels. In the absence of background noises (i.e., in an ideal, controlled listening environment like an audiology booth), a person with average hearing senses can perceive a change (increase or decrease) of approximately 3 decibels. In outdoor settings where normal background noises are a mixture of transportation noise and noise from other human activities, a 3-decibel change would be less noticeable to a person with average hearing senses. For this reason, DRPT does not believe that absorptive treatments are necessary, but will continue to coordinate with WMATA regarding potential impacts of retaining walls during DC2RVA final design, which would occur as funding becomes available and incremental improvements are scheduled.

RE: Randolph-Macon College comments regarding Draft Environmental Impact Statement

Dear Ms. Stock:

Please accept this as Randolph-Macon College's official comment on the DC2RVA Draft Environmental Impact Statement (DEIS). This is being sent to you during the September 8 to November 7, 2017 DEIS public comment period.

Randolph-Macon College has been pleased to be a constructive part of the Department of Rail and Public Transportation's (DRPT) planning process for the DC2RVA project. We have been significantly engaged since June 2016, when we first learned that the project could have devastating effects on our historic campus. We have been meeting and corresponding frequently with DRPT, the Town of Ashland, Hanover County, area residents and business owners, and, of course, the College's students, faculty, staff, alumni, and others important to our campus community.

In this document, we want to note clearly that Randolph-Macon College is a historic, vibrant, financially strong institution and that it has an undisputed economic and educational impact on Virginia. Additionally, and importantly, the College operates in a very competitive higher education market. A major rail infrastructure project that permanently impacts and disrupts our College will have a significant, long-term negative impact and threaten the College's ability to most effectively compete in the market and continue being an economic and educational force. 1

P.O. Box 5005, Ashland, VA 23005-5505 (804) 752-7211 Fax(804)752-3129 www.rmc.edu

RANDOLPH MACON COLLEGE

1. FRA and DRPT have evaluated the DC2RVA Project through the mechanism of an Environmental Impact Statement (EIS) to satisfy the requirements of the National Environmental Policy Act (NEPA), and provide the public an opportunity to understand and comment on the benefits and impacts of the Project. As part of the NEPA process and documented within Chapter 2 of the Draft EIS and the Alternatives Technical Report (Appendix A of the Draft EIS), FRA conducted a rigorous analysis of Project alternatives and their potential impacts on the natural and/or built environment, including impacts to Randolph Macon College. The Preferred Alternative through the Ashland/Hanover area, Alternative 5A, minimizes adverse impacts on the area's natural and built environments; refer to DRPT-numbered statement #4 for details.

Important Facts About Randolph-Macon College

2

We believe it is important for DEIS context to note the College's history, current status, plans for growth, and economic impact.

- **History of Randolph-Macon College**

  Founded in 1830, Randolph-Macon College is the nation's oldest Methodist-related institution of higher education. The College was first located in Boydton (Mecklenburg County), Virginia, and was relocated to Ashland in 1868 following the Civil War. The College is home to several historic structures that are in near proximity to the CSX rail line. The campus was added to the National Register of Historic Places and the Virginia Landmarks Register in 1979.

- **Randolph-Macon College Has Important Economic and Educational Impacts**

  Today, the College is a thriving corporate and educational entity, employing hundreds of people and producing tens of millions of dollars in local and state economic activity. However, that is not to say that we have it easy. The Virginia and Mid-Atlantic higher education market place is exceedingly competitive, especially for liberal arts institutions.

  The following economic impact data is the result of an economic impact analysis done for the College in August 2016:

  The College is situated wholly within the Town of Ashland on an approximately 116-acre campus.

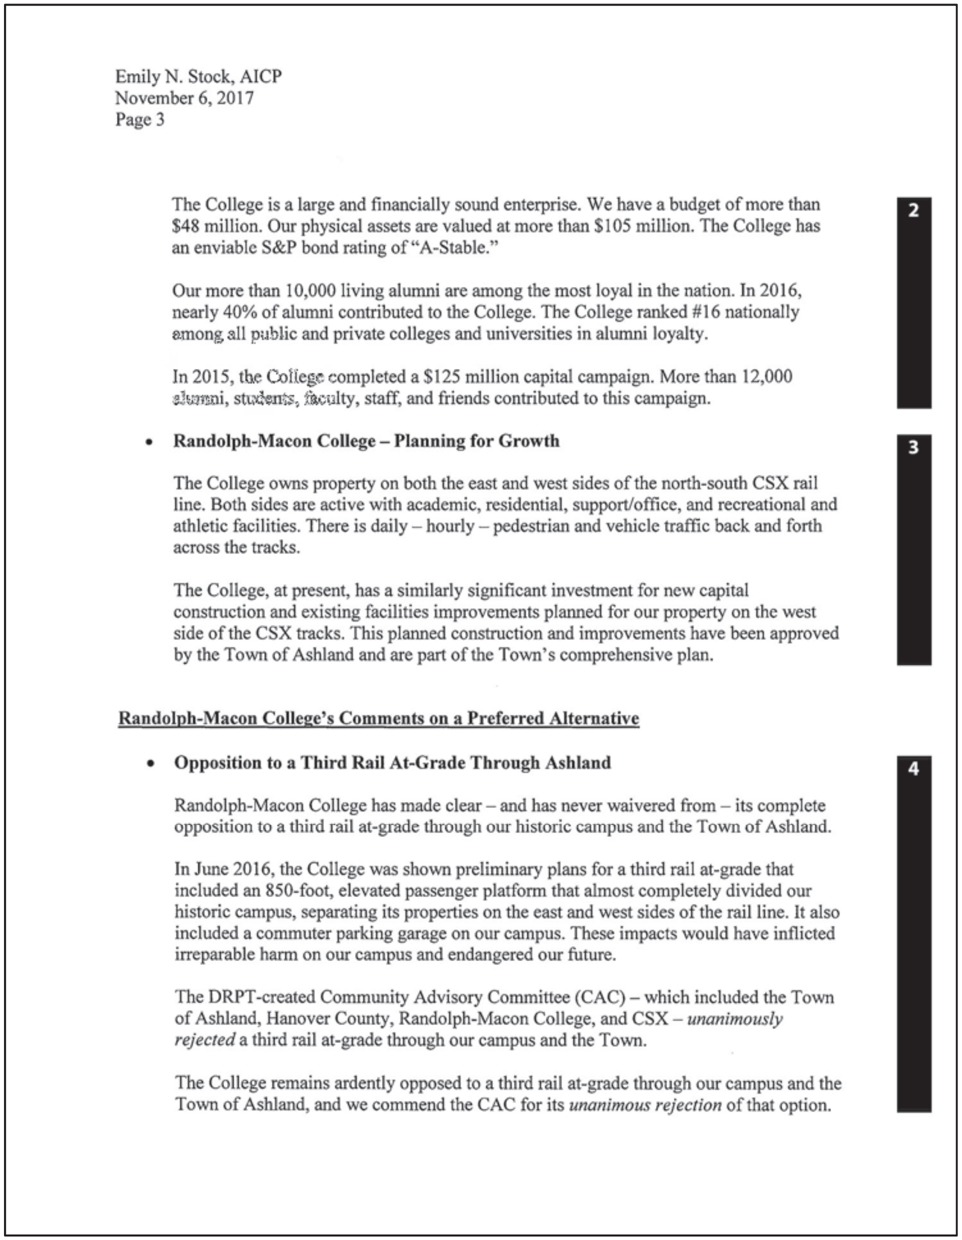
  The College has some 450 faculty and staff with an approximately $21.5 million payroll. The College produces more than $32 million in overall annual direct and indirect local economic activity and some $1.1 million in local and state taxes in the Ashland/Hanover community. More broadly, the College's direct and indirect annual economic impact statewide supports some 813 jobs and approximately $75.8 million in economic activity and $2.3 million in state and local tax revenue.

  The College has 1,454 full-time students who, in pursuit of undergraduate degrees, may choose from 34 major fields of study.

  The College's 2014-15 graduating class carried with them into the Virginia workforce an economic value of $5.4 million. Consequently, a four-year academic cycle would produce more than $21 million in human capital value. Over a decade, it would be some $54 million.

RANDOLPH MACON COLLEGE (continued)

2. FRA recognizes the importance of Randolph Macon College to the Town of Ashland, the Commonwealth of Virginia, and the College's many students, employees, and alumnae. The history, current status, and expansion plans of the College are described and considered in the Draft EIS, including in Section 3.11 Community Resources and Section 3.13 Archaeological and Aboveground Cultural and Historic Resources. The Commonwealth's recommendation to FRA specifically requests that the DC2RVA Project be advanced in a manner that avoids and/or minimizes permanent property impacts to the College, as indicated in the Commonwealth Transportation Board's (CTB) Resolution for the Project on December 6, 2017 (which is Appendix H of the Final EIS). Refer to DRPT-numbered statements #3 and #4 for further details.



Emily N. Stock, AICP
November 6, 2017
Page 3

2 The College is a large and financially sound enterprise. We have a budget of more than $48 million. Our physical assets are valued at more than $105 million. The College has an enviable S&P bond rating of "A-Stable."

Our more than 10,000 living alumni are among the most loyal in the nation. In 2016, nearly 40% of alumni contributed to the College. The College ranked #16 nationally among all public and private colleges and universities in alumni loyalty.

In 2015, the College completed a $125 million capital campaign. More than 12,000 alumni, students, faculty, staff, and friends contributed to this campaign.

- **Randolph-Macon College – Planning for Growth**

3 The College owns property on both the east and west sides of the north-south CSX rail line. Both sides are active with academic, residential, support/office, and recreational and athletic facilities. There is daily – hourly – pedestrian and vehicle traffic back and forth across the tracks.

The College, at present, has a similarly significant investment for new capital construction and existing facilities improvements planned for our property on the west side of the CSX tracks. This planned construction and improvements have been approved by the Town of Ashland and are part of the Town's comprehensive plan.

Randolph-Macon College's Comments on a Preferred Alternative

- **Opposition to a Third Rail At-Grade Through Ashland**

4 Randolph-Macon College has made clear – and has never waivered from – its complete opposition to a third rail at-grade through our historic campus and the Town of Ashland.

In June 2016, the College was shown preliminary plans for a third rail at-grade that included an 850-foot, elevated passenger platform that almost completely divided our historic campus, separating its properties on the east and west sides of the rail line. It also included a commuter parking garage on our campus. These impacts would have inflicted irreparable harm on our campus and endangered our future.

The DRPT-created Community Advisory Committee (CAC) – which included the Town of Ashland, Hanover County, Randolph-Macon College, and CSX – *unanimously rejected* a third rail at-grade through our campus and the Town.

The College remains ardently opposed to a third rail at-grade through our campus and the Town of Ashland, and we commend the CAC for its *unanimous rejection* of that option.

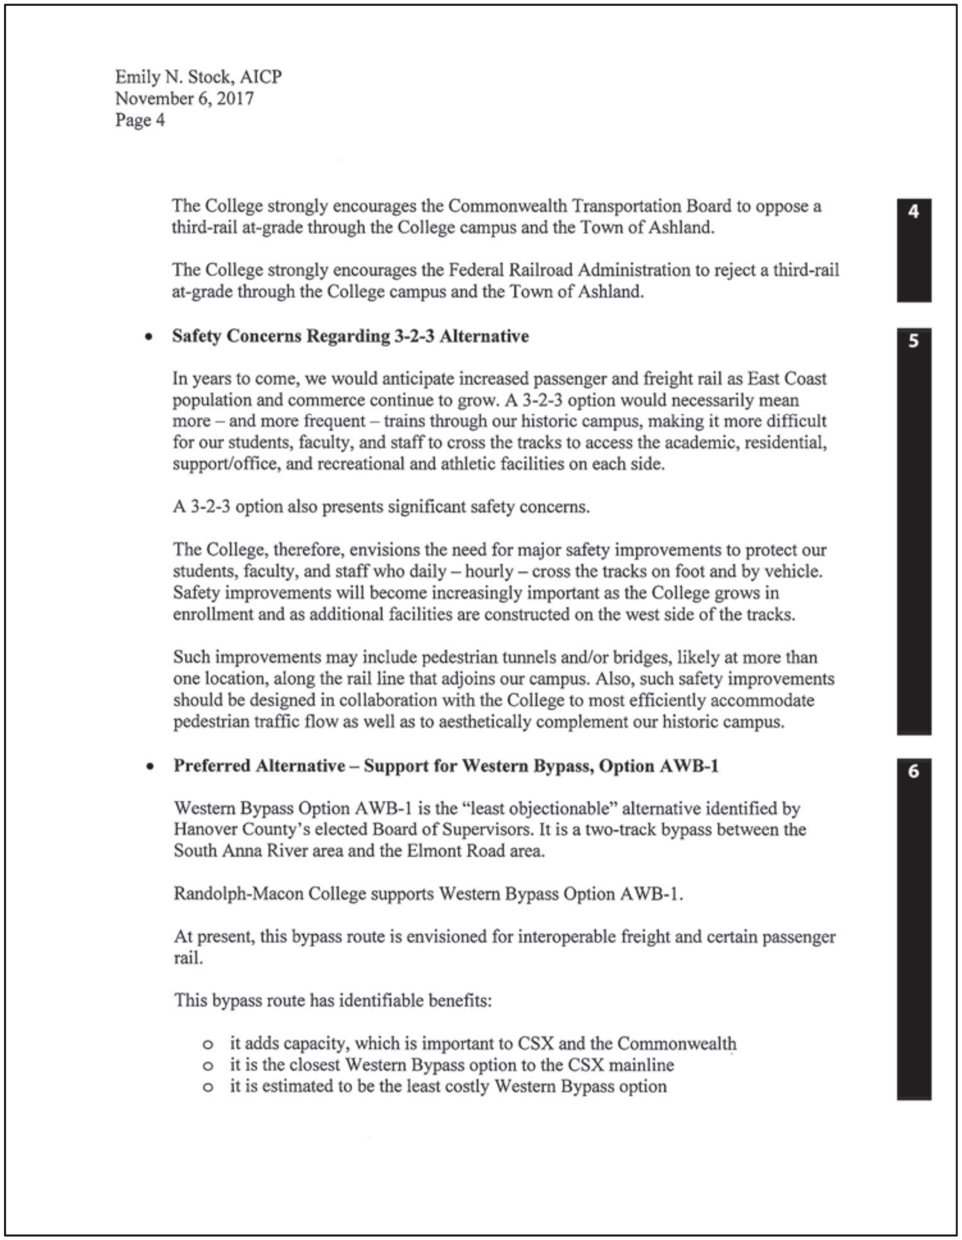
RANDOLPH MACON COLLEGE (continued)

(Response to comment 2 on previous page)

3. The Randolph Macon College Master Plan and the Town of Ashland Comprehensive Plan were both reviewed as a part of the Project's planning process. The Preferred Alternative for Area 5, Alternative 5A, would not affect any structures on the campus and, pursuant to the CTB resolution of December 6, 2017 (Appendix H of the Final EIS), would not require any property acquisition from the College.

4. DRPT acknowledges the College's preference to avoid any and all impacts to the College. In accordance with the September 2017 recommendation of the Town of Ashland/Hanover County Community Advisory Committee (CAC) (Appendix G of the Final EIS) and with the December 2017 resolutions of the Commonwealth Transportation Board (Appendix H of the Final EIS), Build Alternative 5A was selected as the Preferred Alternative, as detailed in Section 4.3.5 of the Final EIS.

   The Preferred Alternative maintains the existing rail infrastructure through the Town of Ashland and Randolph Macon College campus. Moreover, the Preferred Alternative would not include any roadway or station modifications within downtown Ashland. Any platform improvements at the Ashland Station would be negotiated between the Town of Ashland and Amtrak, separate from and with no proposed changes under the DC2RVA Project. Similarly, there would be no roadway improvements (including no modifications to existing at-grade crossing treatments) between Vaughan Road (Archie Cannon Drive) and Ashcake Road under the DC2RVA Project, including College Avenue/Henry Clay Street crossing, which would remain open with no proposed changes under the DC2RVA Project.



Emily N. Stock, AICP
November 6, 2017
Page 4

4

The College strongly encourages the Commonwealth Transportation Board to oppose a third-rail at-grade through the College campus and the Town of Ashland.

The College strongly encourages the Federal Railroad Administration to reject a third-rail at-grade through the College campus and the Town of Ashland.

5

- **Safety Concerns Regarding 3-2-3 Alternative**

In years to come, we would anticipate increased passenger and freight rail as East Coast population and commerce continue to grow. A 3-2-3 option would necessarily mean more – and more frequent – trains through our historic campus, making it more difficult for our students, faculty, and staff to cross the tracks to access the academic, residential, support/office, and recreational and athletic facilities on each side.

A 3-2-3 option also presents significant safety concerns.

The College, therefore, envisions the need for major safety improvements to protect our students, faculty, and staff who daily – hourly – cross the tracks on foot and by vehicle. Safety improvements will become increasingly important as the College grows in enrollment and as additional facilities are constructed on the west side of the tracks.

Such improvements may include pedestrian tunnels and/or bridges, likely at more than one location, along the rail line that adjoins our campus. Also, such safety improvements should be designed in collaboration with the College to most efficiently accommodate pedestrian traffic flow as well as to aesthetically complement our historic campus.

6

- **Preferred Alternative – Support for Western Bypass, Option AWB-1**

Western Bypass Option AWB-1 is the "least objectionable" alternative identified by Hanover County's elected Board of Supervisors. It is a two-track bypass between the South Anna River area and the Elmont Road area.

Randolph-Macon College supports Western Bypass Option AWB-1.

At present, this bypass route is envisioned for interoperable freight and certain passenger rail.

This bypass route has identifiable benefits:

- it adds capacity, which is important to CSX and the Commonwealth
- it is the closest Western Bypass option to the CSX mainline
- it is estimated to be the least costly Western Bypass option

RANDOLPH MACON COLLEGE (continued)

(Response to comment 4 on previous page)

5. The DC2RVA Project will increase intercity passenger train frequencies through the Town of Ashland by 9 new daily intercity passenger round-trip trains (18 total trains per day). Existing intercity passenger service is also expected to continue to operate at the current level of 10 daily round trip trains (20 total trains per day) (i.e., the No Build condition). As a result, under the Project (i.e., the Build condition), total intercity passenger train operations, existing and projected, through Ashland are expected to increase to 19 daily round trip trains (38 total), which DRPT expects would continue to operate at the restricted speed of 35 mph set by CSXT. DRPT has also developed a forecast of CSXT freight train growth that estimates operations to nearly double between 2015 and 2045, reaching approximately 40 to 55 daily freight trains in 2045, regardless of implementation of the DC2RVA Project (i.e., the same for both 2045 No Build and Build conditions). These conditions are clarified in Section 4.2 of the Final EIS.

   DRPT acknowledges the Town's safety concern regarding the frequent daily pedestrian and vehicle crossings of the rail corridor in Ashland, and that any pedestrian crossings that occur in locations other than at designated crossings is unsafe and in contradiction to State law (it is a violation of Virginia code §18.2-159) and CSXT policies on trespass. The construction of two new grade separated roadway crossings at Vaughan Road (Archie Cannon Drive) north of town and Ashcake Road south of town in Alternative 5A will provide an alternate means for vehicular passage across the railroad corridor, allowing for a potential reduction in vehicle traffic utilizing the at-grade crossings through town. The Commonwealth of Virginia recognizes the current and future need to improve railroad and roadway safety through Ashland, independent of the DC2RVA Project, and has committed to working with the FRA, Town of Ashland, Randolph Macon College, CSXT, and other stakeholders on improving crossing safety in the Town of Ashland, separate from the DC2RVA Project, as indicated in the CTB Resolution for the Project on December 6, 2017.

The College strongly encourages the Commonwealth Transportation Board to oppose a third-rail at-grade through the College campus and the Town of Ashland.

The College strongly encourages the Federal Railroad Administration to reject a third-rail at-grade through the College campus and the Town of Ashland.

5

- **Safety Concerns Regarding 3-2-3 Alternative**

In years to come, we would anticipate increased passenger and freight rail as East Coast population and commerce continue to grow. A 3-2-3 option would necessarily mean more – and more frequent – trains through our historic campus, making it more difficult for our students, faculty, and staff to cross the tracks to access the academic, residential, support/office, and recreational and athletic facilities on each side.

A 3-2-3 option also presents significant safety concerns.

The College, therefore, envisions the need for major safety improvements to protect our students, faculty, and staff who daily – hourly – cross the tracks on foot and by vehicle. Safety improvements will become increasingly important as the College grows in enrollment and as additional facilities are constructed on the west side of the tracks.

Such improvements may include pedestrian tunnels and/or bridges, likely at more than one location, along the rail line that adjoins our campus. Also, such safety improvements should be designed in collaboration with the College to most efficiently accommodate pedestrian traffic flow as well as to aesthetically complement our historic campus.

6

- **Preferred Alternative – Support for Western Bypass, Option AWB-1**

Western Bypass Option AWB-1 is the "least objectionable" alternative identified by Hanover County's elected Board of Supervisors. It is a two-track bypass between the South Anna River area and the Elmont Road area.

Randolph-Macon College supports Western Bypass Option AWB-1.

At present, this bypass route is envisioned for interoperable freight and certain passenger rail.

This bypass route has identifiable benefits:

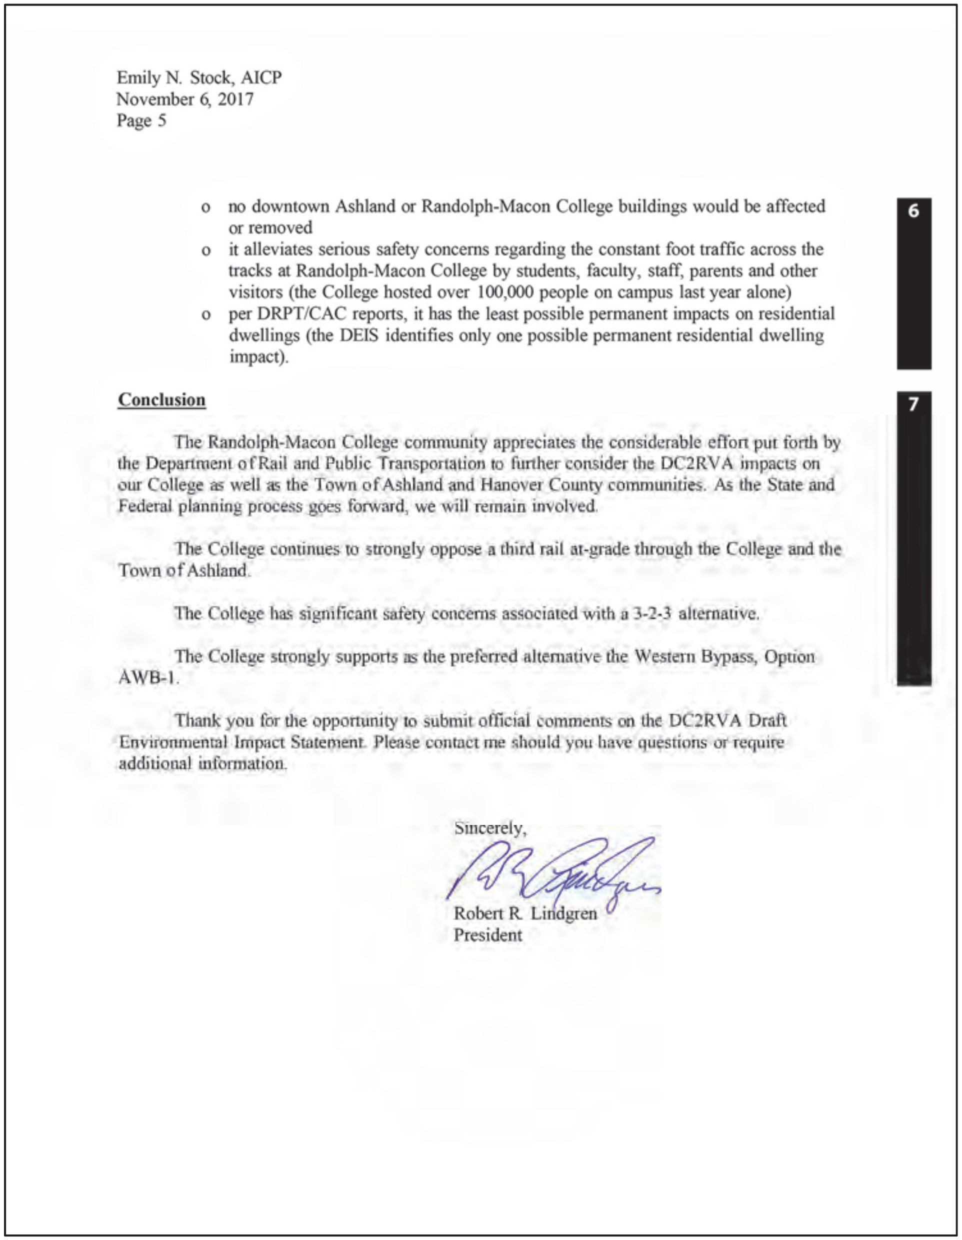
- it adds capacity, which is important to CSX and the Commonwealth
- it is the closest Western Bypass option to the CSX mainline
- it is estimated to be the least costly Western Bypass option

RANDOLPH MACON COLLEGE (continued)

6. DRPT recognizes Randolph Macon's support of the western bypass alternative AWB 1 (a variation of Alternative 5C presented in the Draft EIS), also identified by the Ashland/Hanover CAC as the least objectionable of the western bypass alternatives. However, DRPT eliminated this particular bypass option during the alternatives screening phase due to its impacts to property, wetlands, and other natural resources. Alternative 5A: Maintain Two Tracks through Ashland was selected as the Preferred Alternative for Area 5 (refer to Section 4.3.5 of the Final EIS for details).

   The Preferred Alternative 5A provides the railroad and roadway infrastructure required to support the railroad operations proposed in the DC2RVA Project. As presented in Chapter 5 of the Final EIS, Alternative 5A is expected to affect zero historic properties in downtown Ashland, as no additional infrastructure would be constructed within the Town of Ashland or outside of the CSXT railroad right-of-way through Hanover County. The exception to this includes the construction of new highway-rail grade separations where Vaughan Road (Archie Cannon Drive) and Ashcake Road cross the corridor to the north and south. There are no historic properties in the area of potential effects at the Ashcake Road intersection. There is one historic property at the Vaughan Road (Archie Cannon Drive) intersection: the Berkleytown Historic District. The FRA has determined, and the Virginia Department of Historic Resources (DHR) concurred, that the Project will have an adverse effect and a 4(f) use of this resource. Stipulations to mitigate the adverse effect are set forth in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS).

   Where all other alternatives considered in the Ashland/Hanover County Area would incur impacts to historic or protected resources; NEPA requires the selection of the "avoidance" alternative, which in this case would be Alternative 5A (Maintain Two Tracks Through Town).



Emily N. Stock, AICP
November 6, 2017
Page 5

6

- no downtown Ashland or Randolph-Macon College buildings would be affected or removed
- it alleviates serious safety concerns regarding the constant foot traffic across the tracks at Randolph-Macon College by students, faculty, staff, parents and other visitors (the College hosted over 100,000 people on campus last year alone)
- per DRPT/CAC reports, it has the least possible permanent impacts on residential dwellings (the DEIS identifies only one possible permanent residential dwelling impact).

7

Conclusion

The Randolph-Macon College community appreciates the considerable effort put forth by the Department of Rail and Public Transportation to further consider the DC2RVA impacts on our College as well as the Town of Ashland and Hanover County communities. As the State and Federal planning process goes forward, we will remain involved.

The College continues to strongly oppose a third rail at-grade through the College and the Town of Ashland.

The College has significant safety concerns associated with a 3-2-3 alternative.

The College strongly supports as the preferred alternative the Western Bypass, Option AWB-1.

Thank you for the opportunity to submit official comments on the DC2RVA Draft Environmental Impact Statement. Please contact me should you have questions or require additional information.

Sincerely,

Robert R. Lindgren
President

Document Created: 11/6/2017 9:10:43 AM by Web Comment Form

The Sierra Club Falls of the James (SCFOJ), is the local group of the Sierra Club, the largest and most influential grassroots environmental organization in the United States. Following discussion and vote by the SCFOJ Executive Committee, the SCFOJ would like to supply the following comments:

1 DCtoRVA Rail should be a top priority for the state. Both transit and intercity passenger rail need much higher investment by our state. We need increased revenue sources for transit and rail, to shift $ from highways to rail, and to allow for HOT lane revenues to go to rail. Transportation is an important part of ameliorating climate change.

2 SCFOJ wholeheartedly supports keeping and renovating Main Street Station downtown for passenger rail traffic. We are NOT in favor of leaving Main Street Station rail for one mega-station at Boulevard as some propose. Decades ago, SCFOJ had an initiative called 'Restore The Core', to help bring back downtown Richmond from decay and abandonment. We believe that passenger rail is a vital part of that continuing mission. Millions of public dollars have been invested in Main Street Station, the train shed, and the new Pulse bus line as part of a multi-modal transportation vision. It would absurd and distressing to suddenly change station locations. Main Street Station is the iconic, historic station that our local system needs.

3 The SCFOJ also supports the upgrading of tracks between Staples Mill and Petersburg. While this section involves costly upgrades, we must not shy away from making it a priority.

4 The two station approach -- Main Street, plus keeping Staples Mill -- is appropriate. Staples Mill can serve the suburban west end market and park and ride market through access via 95, 64, and Powhite, while Main Street can serve the revitalizing city and downtown, connecting our state capital directly to Capital Hill in DC, and connect directly to the Pulse Bus Rapid transit.

5 All construction must meet high standards for sediment and erosion control and long-term stormwater management. 6 We promote the "Rails with Trails" goals of the bike advocates -- because the project offers the opportunity to create a major N-S bikeway, though be aware that there are wetlands where it could increase area of fill. The SCFOJ is also hopeful that government can take advantage of opportunities to integrate solar into these projects.

Sincerely,

Scott Burger, on behalf of the Executive Committee of the Sierra Club Falls of the James.
(I supplied my own personal comments earlier, separately, but this is for the SCFOJ)

SIERRA CLUB

1. Transportation priorities for the Commonwealth of Virginia are set by the Commonwealth Transportation Board (CTB) and described in Virginia's Statewide Transportation Plan (Vtrans2040) and the 2017 Virginia State Rail Plan. The DC2RVA Project is listed as a priority project for the Commonwealth.

2. Section 4.2 of the Final EIS provides additional clarification to existing and proposed service at Main Street Station. Main Street Station currently serves 2 round trips (4 total daily) intercity passenger trains. Under Build conditions of the DC2RVA Project, the S-Line will be rebuilt, enabling all existing and proposed new intercity passenger trains stopping at Richmond to serve both Staples Mill Road and Main Street Stations. As a result, Main Street Station will see a total of 18 round trips (36 total daily) intercity passenger trains, which is an increase of 16 round trips (32 total daily) intercity passenger trains above the current service level at Main Street Station. Of those, the DC2RVA Project will:

   - Add 9 new daily intercity passenger round trips (18 new total trains per day)
   - Also reroute 7 existing daily intercity passenger round trips (14 existing total trips per day)

   Thus, the Preferred Alternative for Area 6 - Richmond will increase access to passenger rail services to residents and travelers within the City's Central Business District. The proposed routing of all of the existing and proposed passenger trains (excluding the Auto Train) to serve both Staples Mill Road Station and Main Street Station via the S-Line maximizes passenger rail service to Richmond's downtown. The proposed improvements to accommodate such services at Main Street Station are consistent with the City of Richmond's plans for the station and surrounding area.

(Responses are continued on next page)

(I supplied my own personal comments earlier, separately, but this is for the SCFOJ)

SIERRA CLUB (continued)

3. The Federal Railroad Administration (FRA) and the Department of Rail and Public Transportation (DRPT) recognize the need to improve the full railroad corridor to achieve the full goals and benefits of the larger Southeast High Speed Rail (SEHSR) Program and the Virginia State Rail Plan. The DC2RVA Project proposes track improvements between Arlington and Centralia, VA, and the Richmond to Raleigh (R2R) Tier II EIS/ROD identifies track and other improvements between Centralia, VA and Raleigh, NC, through Petersburg, VA. Section 7.7 of the Final EIS, which has been added since the Draft EIS, addresses the necessary coordination with previous and ongoing studies and projects that are within and/or adjacent to the DC2RVA corridor, that are critical to Project success.
4. DRPT acknowledges the Sierra Club's preference for a two-station approach, which aligns with the Preferred Alternative for Richmond: Alternative 6F: Full Service (Staples Mill Road Station and Main Street Station). Under the Preferred Alternative, all of the existing and proposed passenger trains (excluding the Auto Train) serve both Staples Mill Road Station and Main Street Station. Additionally, the provision of a two-station alternative in Richmond allows for a distribution of ridership, parking, and automobile traffic among the stations.
5. Specific sediment and erosion control measures will be developed during final design as funds become available for final design, permitting, and construction. DRPT will implement comprehensive Best Management Practices (BMPs) for sediment and erosion controls on both a temporary basis during construction and on a long-term basis for the life of the Project.

SIERRA CLUB (continued)

6. Comment noted. The decision to establish a new greenway is a separate and distinct action from establishing high speed passenger rail service under the National Environmental Policy Act (NEPA). During Project scoping, FRA and DRPT received public comments in support of establishing a bicycle/walking path or greenway alongside the DC2RVA corridor. FRA and DRPT considered the addition of a greenway, but determined such a bicycle/walking path was not required to meet the Project's Purpose and Need, as providing a greenway does not support or enhance passenger rail service, nor is it a transportation choice for corridor-level travel. CSXT does not allow recreational use of its right-of-way for safety reasons, and therefore any greenway or path would require additional right-of-way to be acquired along the corridor. This Project does not preclude further consideration or development of such a greenway / path under a separate project in the future.

Re: DC to Richmond Southeast High Speed Rail Study Tier II Draft Environmental Impact Statement

Dear Ms. Stock:

The Southern Environmental Law Center (SELC) would like to provide the following comments on the Tier II Draft Environmental Impact Statement (DEIS) for the Washington, DC to Richmond High Speed Rail (DC2RVA) project. These comments build upon our earlier written and public comments on this project. SELC works throughout Virginia to promote transportation and land use decisions that strengthen our communities, protect our natural resources, and improve our quality of life. This includes a focus on developing a more sustainable transportation system and providing Virginians with a broader range of transportation choices.

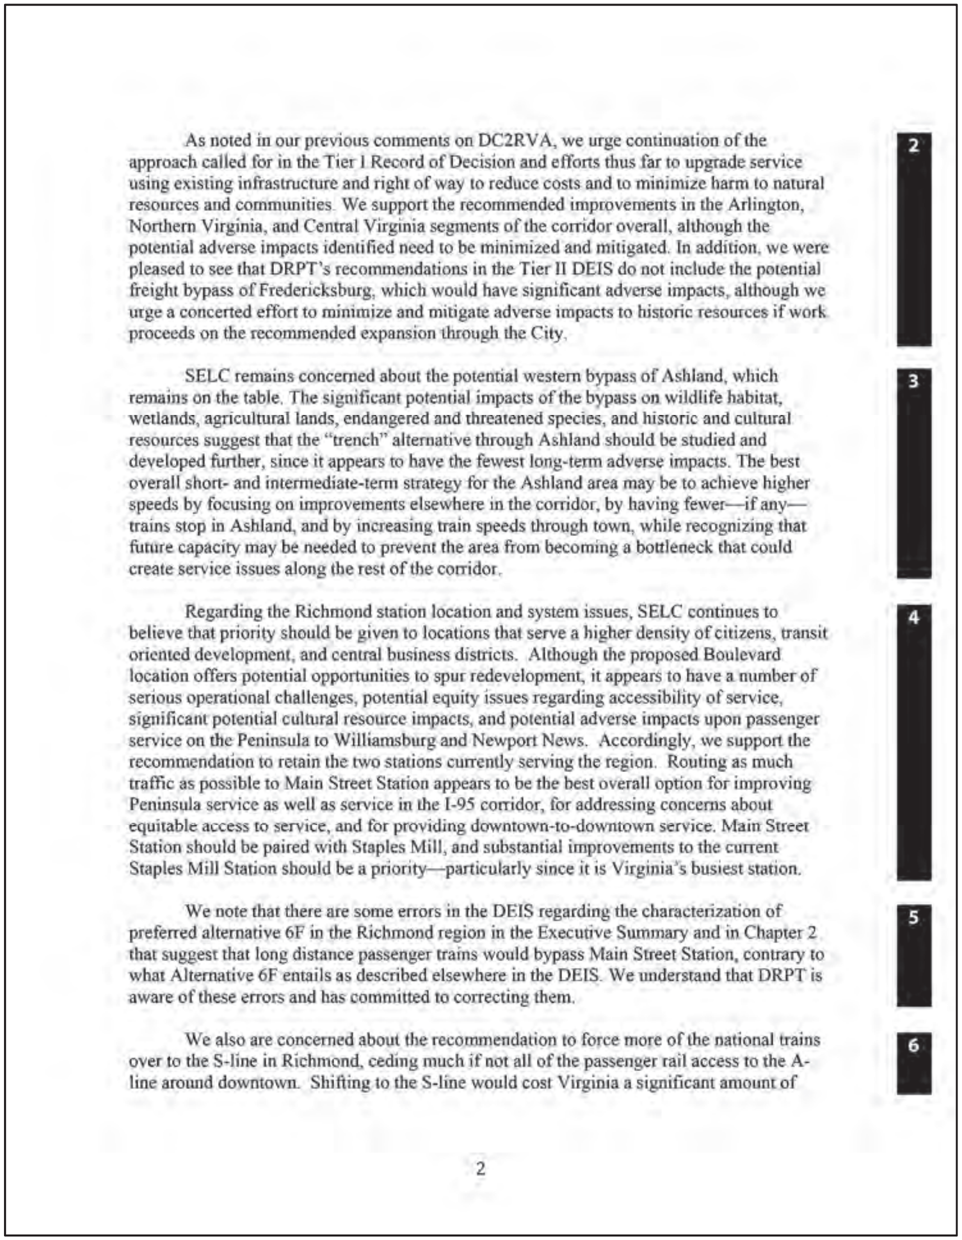
We strongly support enhancing passenger and freight rail in the Commonwealth, and we have long supported efforts to provide fast, frequent, and reliable passenger rail service in the critical Washington, DC to Richmond corridor. The DC2RVA corridor is central to the movement of people and freight throughout Virginia, and it is both a crucial segment of the Southeast High Speed Rail Corridor and a key connector to the Northeast Corridor. The DC2RVA high speed rail project offers multiple benefits, including promoting more compact development patterns, greater energy efficiency, reduced traffic congestion, cleaner air, and providing a backbone for a larger network of efficient transportation options—including increased local light rail and transit. As Virginia Secretary of Transportation Aubrey Layne notes, as quoted on page 4 of the DEIS, the cost and/or impacts of further widening of I-95 and I-395 are prohibitive, and we need to provide travel choices that can take some of the trucks and cars off of these highways. Improving the DC2RVA corridor needs to be a top transportation priority for the Commonwealth.

SELC again suggests that the final set of recommendations list specific near- and intermediate-term projects, and the anticipated benefits and costs of these projects, to reduce resistance to the cost of the total package of recommendations. It is likely to be many years before there is funding to advance a large portion of the DEIS recommendations, and it would be helpful to indicate priority projects that can proceed as funding becomes available and to focus on increasing on-time performance more than increasing speed, continuing the incremental approach that has served Virginia well. 1

Charlottesville • Chapel Hill • Atlanta • Asheville • Birmingham • Charleston • Nashville • Richmond • Washington, DC
100% recycled paper

SOUTHERN ENVIRONMENTAL LAW CENTER (SELC)

1. Chapter 7 of the Final EIS, which has been added since the Draft EIS, provides descriptions of future steps of the Project, including funding, prioritization of adding capacity, final design, permitting, and construction. Complete build-out of the corridor and full implementation of the DC2RVA improvements (and realization of all Project benefits) is dependent on future state and federal funding. DRPT anticipates the DC2RVA Project would be implemented incrementally, as funding becomes available. The funding for the Project is anticipated to come from multiple sources, including federal, state, and local funds, plus passenger fare revenue recovery and private sector sources. Subsequent to the Final EIS, DRPT is developing a Corridor Service Development Plan that addresses likely phasing of improvements and Project benefits, including additional train service and improved reliability. DRPT has identified the following priorities for adding track capacity along the 123-mile DC2RVA corridor: Areas 1, 2, and 3, Arlington through Fredericksburg; Area 6 Richmond (including improvements to Staples Mill Road Station); Area 4 Central Virginia; and Area 5 Ashland. This does not preclude upgrading stations, or constructing highway-rail grade separations or at-grade crossing improvements, independently of the DC2RVA Project, should federal, state, local, or other funding become available.



2 As noted in our previous comments on DC2RVA, we urge continuation of the approach called for in the Tier I Record of Decision and efforts thus far to upgrade service using existing infrastructure and right of way to reduce costs and to minimize harm to natural resources and communities. We support the recommended improvements in the Arlington, Northern Virginia, and Central Virginia segments of the corridor overall, although the potential adverse impacts identified need to be minimized and mitigated. In addition, we were pleased to see that DRPT's recommendations in the Tier II DEIS do not include the potential freight bypass of Fredericksburg, which would have significant adverse impacts, although we urge a concerted effort to minimize and mitigate adverse impacts to historic resources if work proceeds on the recommended expansion through the City.

3 SELC remains concerned about the potential western bypass of Ashland, which remains on the table. The significant potential impacts of the bypass on wildlife habitat, wetlands, agricultural lands, endangered and threatened species, and historic and cultural resources suggest that the "trench" alternative through Ashland should be studied and developed further, since it appears to have the fewest long-term adverse impacts. The best overall short- and intermediate-term strategy for the Ashland area may be to achieve higher speeds by focusing on improvements elsewhere in the corridor, by having fewer—if any—trains stop in Ashland, and by increasing train speeds through town, while recognizing that future capacity may be needed to prevent the area from becoming a bottleneck that could create service issues along the rest of the corridor.

4 Regarding the Richmond station location and system issues, SELC continues to believe that priority should be given to locations that serve a higher density of citizens, transit oriented development, and central business districts. Although the proposed Boulevard location offers potential opportunities to spur redevelopment, it appears to have a number of serious operational challenges, potential equity issues regarding accessibility of service, significant potential cultural resource impacts, and potential adverse impacts upon passenger service on the Peninsula to Williamsburg and Newport News. Accordingly, we support the recommendation to retain the two stations currently serving the region. Routing as much traffic as possible to Main Street Station appears to be the best overall option for improving Peninsula service as well as service in the I-95 corridor, for addressing concerns about equitable access to service, and for providing downtown-to-downtown service. Main Street Station should be paired with Staples Mill, and substantial improvements to the current Staples Mill Station should be a priority—particularly since it is Virginia's busiest station.

5 We note that there are some errors in the DEIS regarding the characterization of preferred alternative 6F in the Richmond region in the Executive Summary and in Chapter 2 that suggest that long distance passenger trains would bypass Main Street Station, contrary to what Alternative 6F entails as described elsewhere in the DEIS. We understand that DRPT is aware of these errors and has committed to correcting them.

6 We also are concerned about the recommendation to force more of the national trains over to the S-line in Richmond, ceding much if not all of the passenger rail access to the A-line around downtown. Shifting to the S-line would cost Virginia a significant amount of

2

SOUTHERN ENVIRONMENTAL LAW CENTER (SELC) (continued)

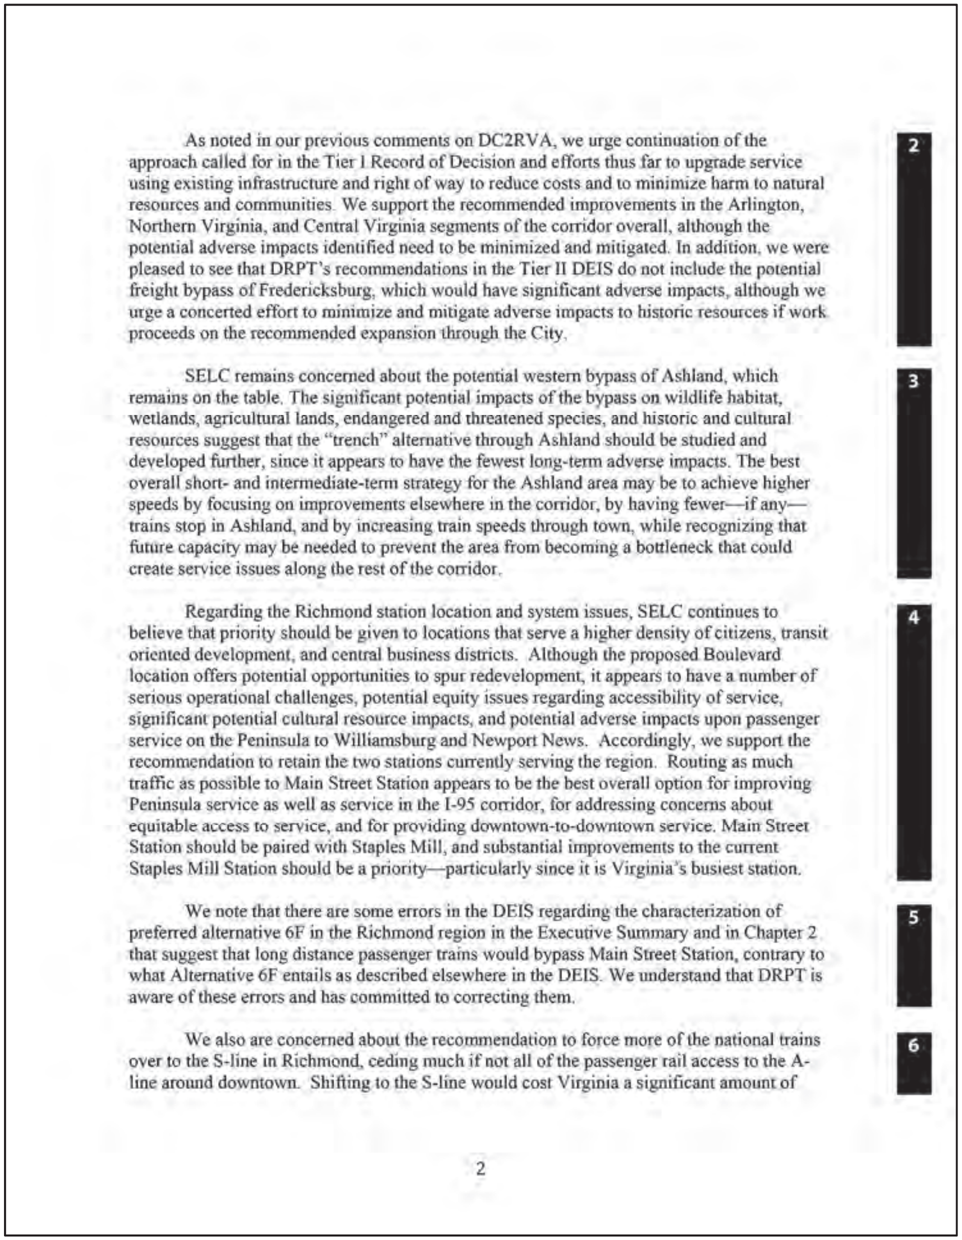
2. Comment noted. Additional measures to minimize and mitigate potential adverse effects will be developed during final design, after incremental improvements are scheduled and funding is secured.

3. In accordance with the September 2017 recommendation of the Town of Ashland/Hanover County Community Advisory Committee (CAC) and with the December 2017 resolutions of the Commonwealth Transportation Board (CTB), Alternative 5A was selected as the Commonwealth's Preferred Alternative, which maintains the existing rail infrastructure through the Town of Ashland and the Randolph Macon College campus. Preferred Alternative 5A provides the railroad and roadway infrastructure required to support the railroad operations proposed in the DC2RVA Project, and no other alternatives/improvements in the Ashland area are recommended as part of the Preferred Alternative.

   A station stop would remain in Ashland under the Preferred Alternative. However, platform improvements at the Ashland Station would be negotiated between the Town of Ashland and Amtrak, separate from and with no proposed changes under the DC2RVA Project. Similarly, there would be no roadway improvements (including no modifications to existing at-grade crossing treatments) between Vaughan Road and Ashcake Road under the DC2RVA Project, including College Avenue/Henry Clay Street, which would remain open with no proposed changes under the DC2RVA Project.

   FRA and DRPT anticipate that train speeds within the Town of Ashland, which are set by CSXT under their operating rules, would remain restricted for safety (currently, 35 mph) due to the number of at-grade vehicle and pedestrian crossings within the Town. The frequency of intercity passenger train service to the Ashland Station would be further determined during development of the Corridor Service Development Plan following the Final EIS and Record of Decision (ROD); refer to Section 7.3 of the Final EIS for details.

(Responses are continued on next page)



2 As noted in our previous comments on DC2RVA, we urge continuation of the approach called for in the Tier I Record of Decision and efforts thus far to upgrade service using existing infrastructure and right of way to reduce costs and to minimize harm to natural resources and communities. We support the recommended improvements in the Arlington, Northern Virginia, and Central Virginia segments of the corridor overall, although the potential adverse impacts identified need to be minimized and mitigated. In addition, we were pleased to see that DRPT's recommendations in the Tier II DEIS do not include the potential freight bypass of Fredericksburg, which would have significant adverse impacts, although we urge a concerted effort to minimize and mitigate adverse impacts to historic resources if work proceeds on the recommended expansion through the City.

3 SELC remains concerned about the potential western bypass of Ashland, which remains on the table. The significant potential impacts of the bypass on wildlife habitat, wetlands, agricultural lands, endangered and threatened species, and historic and cultural resources suggest that the "trench" alternative through Ashland should be studied and developed further, since it appears to have the fewest long-term adverse impacts. The best overall short- and intermediate-term strategy for the Ashland area may be to achieve higher speeds by focusing on improvements elsewhere in the corridor, by having fewer—if any—trains stop in Ashland, and by increasing train speeds through town, while recognizing that future capacity may be needed to prevent the area from becoming a bottleneck that could create service issues along the rest of the corridor.

4 Regarding the Richmond station location and system issues, SELC continues to believe that priority should be given to locations that serve a higher density of citizens, transit oriented development, and central business districts. Although the proposed Boulevard location offers potential opportunities to spur redevelopment, it appears to have a number of serious operational challenges, potential equity issues regarding accessibility of service, significant potential cultural resource impacts, and potential adverse impacts upon passenger service on the Peninsula to Williamsburg and Newport News. Accordingly, we support the recommendation to retain the two stations currently serving the region. Routing as much traffic as possible to Main Street Station appears to be the best overall option for improving Peninsula service as well as service in the I-95 corridor, for addressing concerns about equitable access to service, and for providing downtown-to-downtown service. Main Street Station should be paired with Staples Mill, and substantial improvements to the current Staples Mill Station should be a priority—particularly since it is Virginia's busiest station.

5 We note that there are some errors in the DEIS regarding the characterization of preferred alternative 6F in the Richmond region in the Executive Summary and in Chapter 2 that suggest that long distance passenger trains would bypass Main Street Station, contrary to what Alternative 6F entails as described elsewhere in the DEIS. We understand that DRPT is aware of these errors and has committed to correcting them.

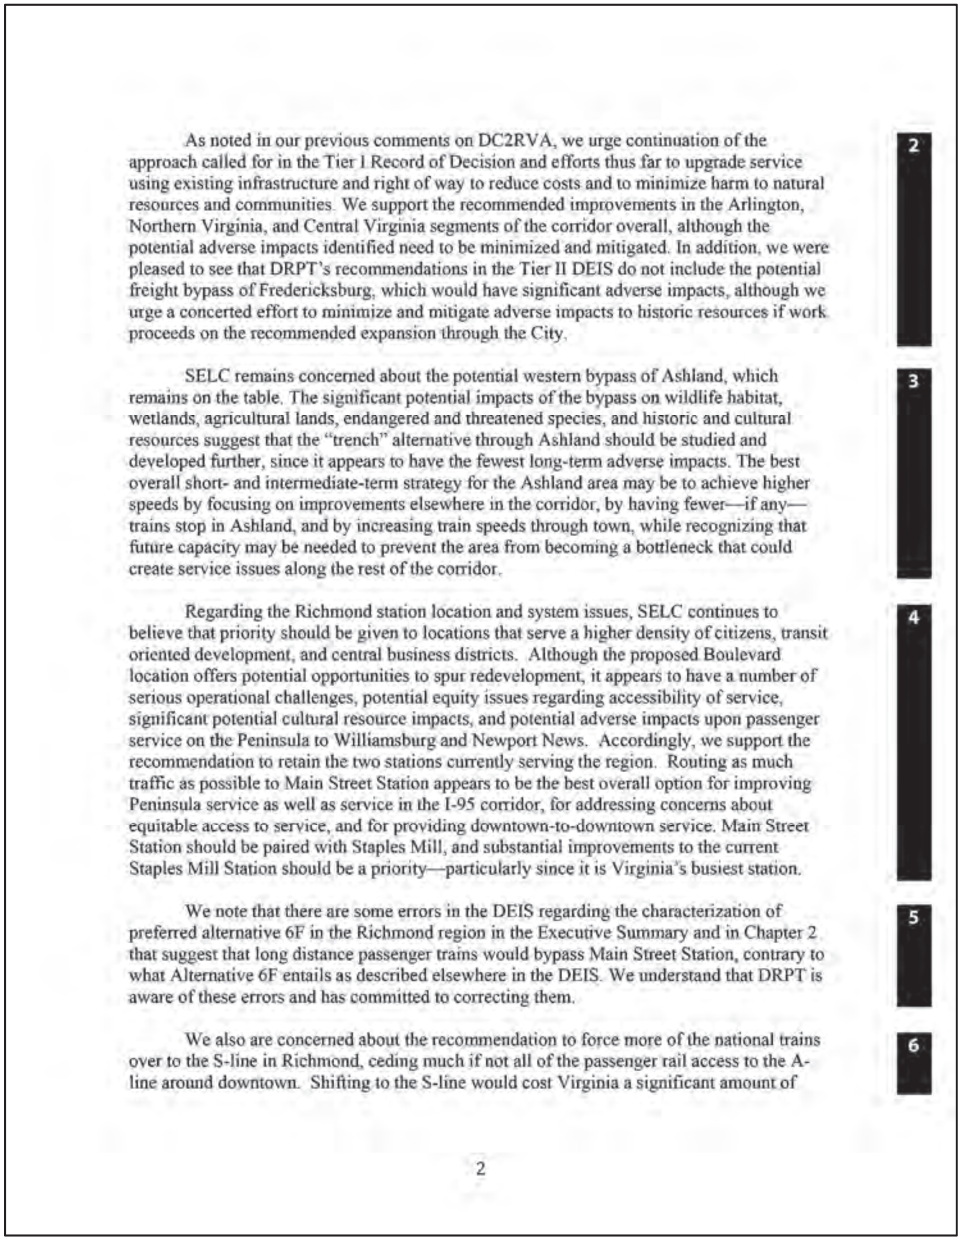
6 We also are concerned about the recommendation to force more of the national trains over to the S-line in Richmond, ceding much if not all of the passenger rail access to the A-line around downtown. Shifting to the S-line would cost Virginia a significant amount of

2

SOUTHERN ENVIRONMENTAL LAW CENTER (SELC) (continued)

4. DRPT acknowledges SELC's preference for a two-station approach, which aligns with the Preferred Alternative for Richmond: Build Alternative 6F: Full Service (Staples Mill Road Station and Main Street Station). The Preferred Alternative routes all of the existing and proposed passenger trains (excluding the Auto Train) to serve both Staples Mill Road Station and Main Street Station, thereby maximizing passenger rail service to Richmond's downtown and existing Staples Mill area.
5. DRPT confirms that the mis-identified train movements are corrected in the Final EIS. All north-south intercity passenger service on the corridor, with the exception of Amtrak's Auto Train, would be routed through Main Street Station under the Preferred Alternative.

(Responses are continued on next page)



As noted in our previous comments on DC2RVA, we urge continuation of the approach called for in the Tier I Record of Decision and efforts thus far to upgrade service using existing infrastructure and right of way to reduce costs and to minimize harm to natural resources and communities. We support the recommended improvements in the Arlington, Northern Virginia, and Central Virginia segments of the corridor overall, although the potential adverse impacts identified need to be minimized and mitigated. In addition, we were pleased to see that DRPT's recommendations in the Tier II DEIS do not include the potential freight bypass of Fredericksburg, which would have significant adverse impacts, although we urge a concerted effort to minimize and mitigate adverse impacts to historic resources if work proceeds on the recommended expansion through the City. 2

SELC remains concerned about the potential western bypass of Ashland, which remains on the table. The significant potential impacts of the bypass on wildlife habitat, wetlands, agricultural lands, endangered and threatened species, and historic and cultural resources suggest that the "trench" alternative through Ashland should be studied and developed further, since it appears to have the fewest long-term adverse impacts. The best overall short- and intermediate-term strategy for the Ashland area may be to achieve higher speeds by focusing on improvements elsewhere in the corridor, by having fewer—if any—trains stop in Ashland, and by increasing train speeds through town, while recognizing that future capacity may be needed to prevent the area from becoming a bottleneck that could create service issues along the rest of the corridor. 3

Regarding the Richmond station location and system issues, SELC continues to believe that priority should be given to locations that serve a higher density of citizens, transit oriented development, and central business districts. Although the proposed Boulevard location offers potential opportunities to spur redevelopment, it appears to have a number of serious operational challenges, potential equity issues regarding accessibility of service, significant potential cultural resource impacts, and potential adverse impacts upon passenger service on the Peninsula to Williamsburg and Newport News. Accordingly, we support the recommendation to retain the two stations currently serving the region. Routing as much traffic as possible to Main Street Station appears to be the best overall option for improving Peninsula service as well as service in the I-95 corridor, for addressing concerns about equitable access to service, and for providing downtown-to-downtown service. Main Street Station should be paired with Staples Mill, and substantial improvements to the current Staples Mill Station should be a priority—particularly since it is Virginia's busiest station. 4

We note that there are some errors in the DEIS regarding the characterization of preferred alternative 6F in the Richmond region in the Executive Summary and in Chapter 2 that suggest that long distance passenger trains would bypass Main Street Station, contrary to what Alternative 6F entails as described elsewhere in the DEIS. We understand that DRPT is aware of these errors and has committed to correcting them. 5

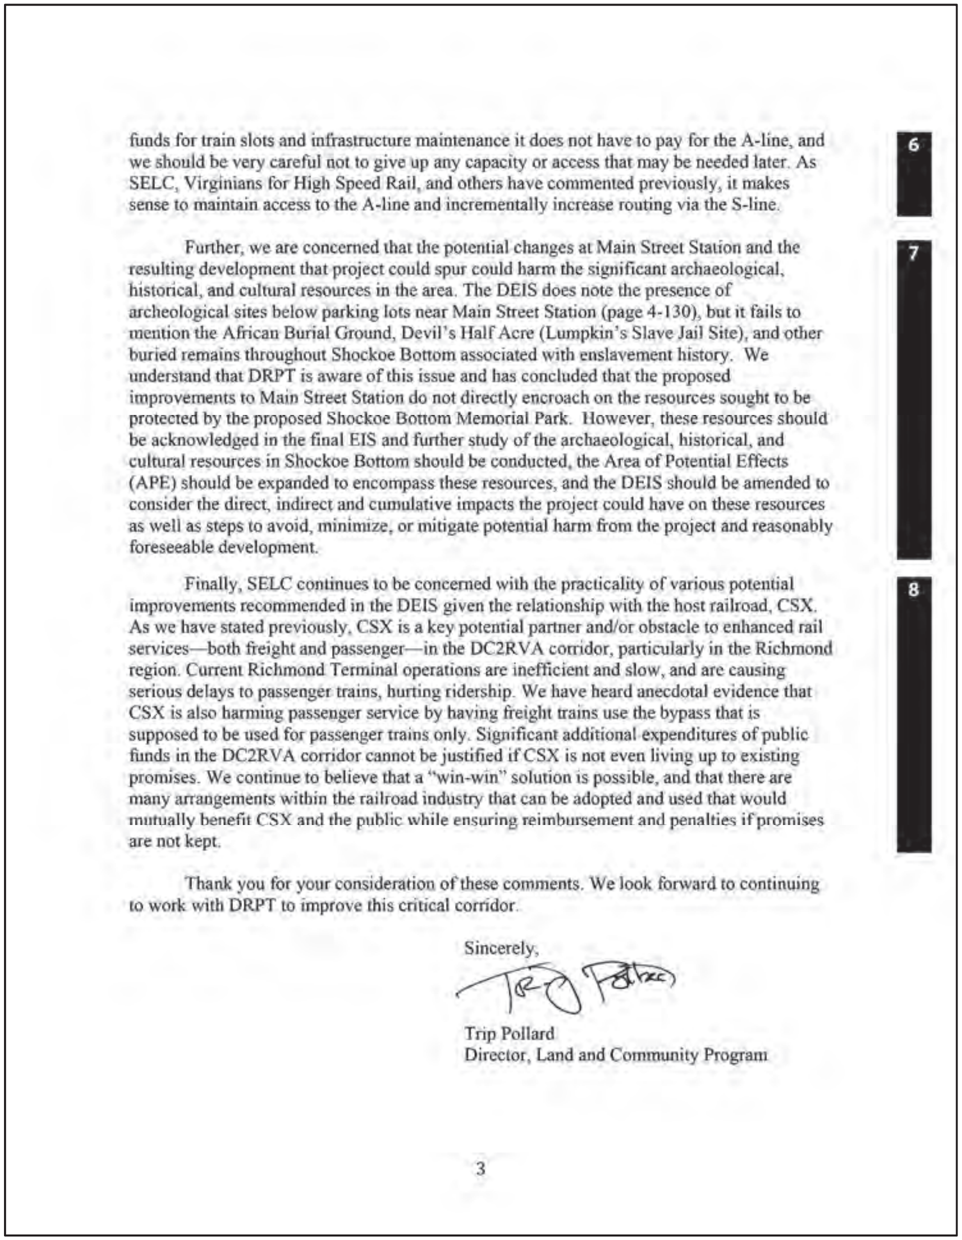
We also are concerned about the recommendation to force more of the national trains over to the S-line in Richmond, ceding much if not all of the passenger rail access to the A-line around downtown. Shifting to the S-line would cost Virginia a significant amount of 6

2

SOUTHERN ENVIRONMENTAL LAW CENTER (SELC) (continued)

6. As part of the Preferred Alternative in Richmond (Alternative 6F, as described in DRPT-numbered statement #4 above), all north-south intercity passenger service on the corridor, with the exception of Amtrak's Auto Train, would be routed through Main Street Station. The Auto Train would bypass Main Street Station on the A-Line, as it does not stop in Richmond and does not fit through the historic Triple Crossing rail structure immediately south of Main Street Station. Operating some intercity passenger trains on the A-Line (as suggested within the comment) would prevent them from stopping at Main Street Station, and would be inconsistent with the Preferred Alternative.

   DRPT performed detailed operations analysis of the railroad network through the Richmond section of the DC2RVA corridor, which supported the advancement of the alternatives shifting passenger service to the S-Line through Richmond. Chapter 2.6 and Appendix I (Operations Modeling) of the Draft EIS provide additional information on the operations modeling process in regard to routing operations in and around Richmond. The forecasted growth in freight traffic through the corridor in the No Build Alternative and all considered Build Alternatives demonstrated increased demand for freight capacity on the A-Line west of downtown Richmond; however, there is limited ability to increase capacity on the A-Line due to its constrained alignment in the median of I-195 and across the James River. Through physical survey and continued operations analysis, DRPT determined that the S-Line can accommodate the construction of additional capacity to support the reroute of existing and expansion of intercity passenger rail service proposed in the DC2RVA Project. DRPT believes that the A-Line does offer much needed redundancy in the Richmond area's passenger and freight rail network should unforeseen occurrences inhibit the movement of trains via the S-line. The infrastructure improvements proposed by the DC2RVA Project do not preclude use of the A-Line by passenger trains in the event of unforeseen occurrences that would prevent the use of the S-Line for passenger service, or if desired by Amtrak under its statutory authority. Refined operations analysis as part of the Final EIS looked at the ability of the corridor as a whole to meet the Project's Purpose and Need; refer to Final EIS Section 3.2 and its Appendix F.



6 funds for train slots and infrastructure maintenance it does not have to pay for the A-line, and we should be very careful not to give up any capacity or access that may be needed later. As SELC, Virginians for High Speed Rail, and others have commented previously, it makes sense to maintain access to the A-line and incrementally increase routing via the S-line.

7 Further, we are concerned that the potential changes at Main Street Station and the resulting development that project could spur could harm the significant archaeological, historical, and cultural resources in the area. The DEIS does note the presence of archeological sites below parking lots near Main Street Station (page 4-130), but it fails to mention the African Burial Ground, Devil's Half Acre (Lumpkin's Slave Jail Site), and other buried remains throughout Shockoe Bottom associated with enslavement history. We understand that DRPT is aware of this issue and has concluded that the proposed improvements to Main Street Station do not directly encroach on the resources sought to be protected by the proposed Shockoe Bottom Memorial Park. However, these resources should be acknowledged in the final EIS and further study of the archaeological, historical, and cultural resources in Shockoe Bottom should be conducted, the Area of Potential Effects (APE) should be expanded to encompass these resources, and the DEIS should be amended to consider the direct, indirect and cumulative impacts the project could have on these resources as well as steps to avoid, minimize, or mitigate potential harm from the project and reasonably foreseeable development.

8 Finally, SELC continues to be concerned with the practicality of various potential improvements recommended in the DEIS given the relationship with the host railroad, CSX. As we have stated previously, CSX is a key potential partner and/or obstacle to enhanced rail services—both freight and passenger—in the DC2RVA corridor, particularly in the Richmond region. Current Richmond Terminal operations are inefficient and slow, and are causing serious delays to passenger trains, hurting ridership. We have heard anecdotal evidence that CSX is also harming passenger service by having freight trains use the bypass that is supposed to be used for passenger trains only. Significant additional expenditures of public funds in the DC2RVA corridor cannot be justified if CSX is not even living up to existing promises. We continue to believe that a "win-win" solution is possible, and that there are many arrangements within the railroad industry that can be adopted and used that would mutually benefit CSX and the public while ensuring reimbursement and penalties if promises are not kept.

Thank you for your consideration of these comments. We look forward to continuing to work with DRPT to improve this critical corridor.

Sincerely,

Trip Pollard
Director, Land and Community Program

3

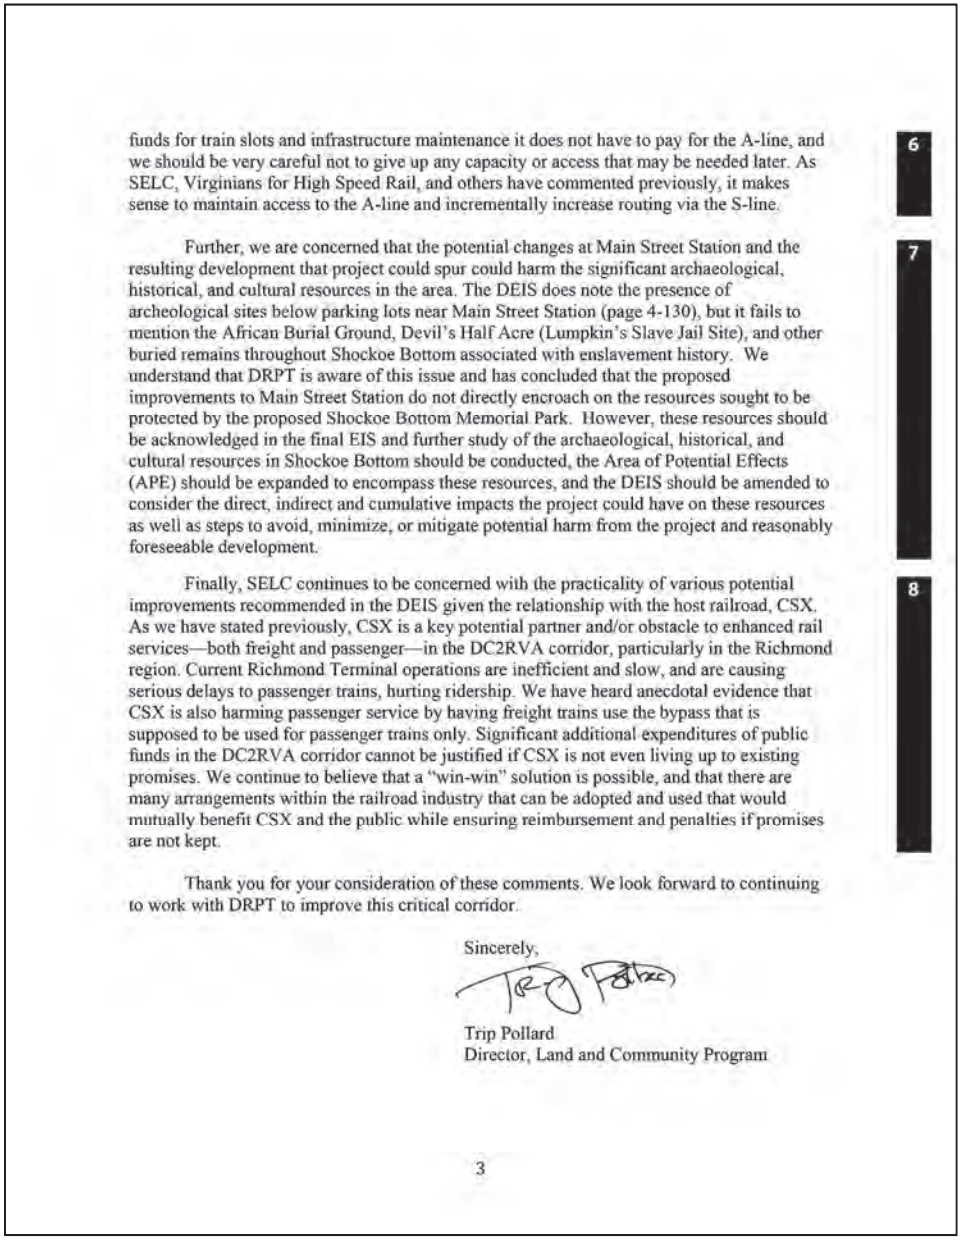
SOUTHERN ENVIRONMENTAL LAW CENTER (SELC) (continued)

(Response to comment 6 on previous page)

7. The FRA and DRPT fully understand the sensitivity and significance of the Shockoe Bottom area, and in particular the area slated for the Memorial Park. DRPT reviewed prior studies that recorded and evaluated archaeological and architectural properties in this area, which have been ongoing since 2006. Resources in Shockoe Bottom, including the proposed Memorial Park area, are discussed in Chapters 3, 5, and 6 of the Final EIS and within several reports in its Appendix D (cultural resource technical reports). Throughout the studies and agency/public consultation, the historic places in this area have been taken into consideration, including Lumpkins Jail/Devil's Half Acre and the Burial Ground, among others. The Preferred Alternative does not impact the known boundaries of these sites. At the request of several consulting parties, Lumpkins Jail site was added to the list of historic properties. The DHR determined that the Project will have no adverse effect on the site as no impacts will occur as part of the Project. A commitment to create a historic context on the Shockoe Bottom area and the slave trade is included in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS).

   Alternative 6F (Full Service Staples Mill Road/Main Street Station) was selected as the Preferred Alternative in Area 6 through Richmond. Through review and investigation of historic records, consultation with consulting parties and other groups with a vested knowledge of this area, and in comments received from the public and SELC, DRPT has reduced the facilities proposed for construction at Main Street Station to the minimum infrastructure necessary to deliver the service proposed in the DC2RVA Project, including: a reduction in the design length of the platforms on the east and west sides of the station to remain south of East Broad Street and to the minimum width feasible to support the forecasted level of ridership and services provided at the station, and the removal of the proposed parking deck. The provision of a two-station alternative in Richmond allows for a distribution of ridership, parking, and automobile traffic among the two stations. Therefore, the Preferred Alternative minimizes the infrastructure required and potential impacts associated with Main Street Station and nearby historic properties.

(Responses are continued on next page)



6

funds for train slots and infrastructure maintenance it does not have to pay for the A-line, and we should be very careful not to give up any capacity or access that may be needed later. As SELC, Virginians for High Speed Rail, and others have commented previously, it makes sense to maintain access to the A-line and incrementally increase routing via the S-line.

7

Further, we are concerned that the potential changes at Main Street Station and the resulting development that project could spur could harm the significant archaeological, historical, and cultural resources in the area. The DEIS does note the presence of archeological sites below parking lots near Main Street Station (page 4-130), but it fails to mention the African Burial Ground, Devil's Half Acre (Lumpkin's Slave Jail Site), and other buried remains throughout Shockoe Bottom associated with enslavement history. We understand that DRPT is aware of this issue and has concluded that the proposed improvements to Main Street Station do not directly encroach on the resources sought to be protected by the proposed Shockoe Bottom Memorial Park. However, these resources should be acknowledged in the final EIS and further study of the archaeological, historical, and cultural resources in Shockoe Bottom should be conducted, the Area of Potential Effects (APE) should be expanded to encompass these resources, and the DEIS should be amended to consider the direct, indirect and cumulative impacts the project could have on these resources as well as steps to avoid, minimize, or mitigate potential harm from the project and reasonably foreseeable development.

8

Finally, SELC continues to be concerned with the practicality of various potential improvements recommended in the DEIS given the relationship with the host railroad, CSX. As we have stated previously, CSX is a key potential partner and/or obstacle to enhanced rail services—both freight and passenger—in the DC2RVA corridor, particularly in the Richmond region. Current Richmond Terminal operations are inefficient and slow, and are causing serious delays to passenger trains, hurting ridership. We have heard anecdotal evidence that CSX is also harming passenger service by having freight trains use the bypass that is supposed to be used for passenger trains only. Significant additional expenditures of public funds in the DC2RVA corridor cannot be justified if CSX is not even living up to existing promises. We continue to believe that a "win-win" solution is possible, and that there are many arrangements within the railroad industry that can be adopted and used that would mutually benefit CSX and the public while ensuring reimbursement and penalties if promises are not kept.

Thank you for your consideration of these comments. We look forward to continuing to work with DRPT to improve this critical corridor.

SOUTHERN ENVIRONMENTAL LAW CENTER (SELC) (continued)

8. FRA and DRPT are committed to continue working with CSXT to improve intercity passenger rail service in the DC2RVA corridor, and have a long and successful history of cooperating with CSXT to improve passenger, commuter, and freight rail service in the Commonwealth. FRA and DRPT also recognize that CSXT owns and operates the DC2RVA rail corridor, and has a responsibility to its shareholders and customers to provide efficient freight rail service. Timely passenger train movements through the CSXT Richmond Terminal operations at Acca Yard are an existing issue, and a separate project is currently underway to allow through movements of trains onto the A-Line while reducing interference from yard operations. The Preferred Alternative for the Richmond area, Alternative 6F, also includes provisions for passenger trains to bypass Acca Yard to the east while moving between Staples Mill Road Station and Main Street Station, thereby reducing future conflicts.

Ms. Emily Stock
Manager of Rail Planning
DRPT
DC2RVA Project Office
801 East Main Street, Suite 1000
Richmond, VA 23219
By email info@DC2RVArail.com

Dear Ms. Stock,

On behalf of Preservation Virginia's Trustees, staff and statewide membership, I am writing to register our comments as the Federal Railroad Administration evaluates the potential environmental impacts of the proposed high-speed railroad facility at Main Street Station.

Shockoe Bottom was the center of the slave trade in Richmond. Second only to New Orleans, the area was populated by jails that facilitated the sales' process of enslaved people and the businesses and industries that supported that market place. The African Burial Ground is a sacred place where enslaved and freed African Americans found their final rest. Today, the area has been literally paved over--capturing an archeological record of the streets, buildings and associated structures that facilitated these commercial activities. 1

With its important archaeological, cultural and historic resources, Shockoe Bottom requires careful study and evaluation before any decisions about the high-speed rail facility are made. While Devil's Half Acre (Lumpkin's Jail) has been excavated and studied, it is the only area that has been evaluated. That excavation and the archival work that has been undertaken prove the likelihood that the archeological evidence of other buildings and street patterns exists under the asphalt and awaits study.

Before any plans are finalized, Preservation Virginia urges the Federal Railroad Administration to:

- Commission a comprehensive analysis of the archaeological, historical and cultural resources in Shockoe Bottom. 2
- Evaluate Shockoe Bottom for listing on the National Register of Historic Places. 3
- Expand the "Area of Potential Effects" to include the archaeological, historical, and cultural resources associated with Shockoe Bottom. 4
- Consider the full range of potential impacts – "direct, indirect and cumulative" -- to these surviving resources and study ways to "avoid, minimize, or mitigate" potential harm from the railroad facility, and any reasonably foreseeable real estate development. 5

Preservation Virginia has been a voice for historic places since 1889. As the Commonwealth's nonprofit statewide historic preservation organization, we seek ways to save historic places while accommodating

PRESERVATION VIRGINIA

1. The FRA and DRPT fully understand the sensitivity and significance of the Shockoe Bottom area, and in particular the area slated for the Memorial Park. DRPT reviewed prior studies that recorded and evaluated archaeological and architectural properties in this area, which have been ongoing since 2006. Resources in Shockoe Bottom including the proposed Memorial Park area are discussed in Chapters 3, 5, and 6 of the Final EIS and within several reports in Appendix D (cultural resource technical reports). Throughout the studies and agency and public consultation, the historic places located in this area have been taken into consideration during Project planning. This includes Lumpkins Jail/Devil's Half Acre and the Burial Ground, among others. The Project, as currently designed, does not impact the known boundaries of these sites. At the request of several consulting parties, the Lumpkins Jail site was added to the list of historic properties. The DHR concurred that the Project will have no adverse effect on the site as no impacts will occur as part of the Project. However, a commitment to create a historic context on the Shockoe Bottom area and the slave trade is included in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS). Alternative 6F (Full Service Staples Mill Road/Main Street Station) was selected as the Preferred Alternative in Area 6 through Richmond. Through review and investigation of historic records, consultation with Project consulting parties and individuals with a vested knowledge in this area, and in comments received from the public and Preservation Virginia, DRPT has reduced the facilities proposed for construction at Main Street Station to the minimum infrastructure necessary to deliver the service proposed in the DC2RVA Project. This includes a reduction in the length of the platforms on the east and west sides of the station to remain south of East Broad Street and to the minimum width feasible to support the forecasted level of ridership and services provided at the station, and the removal of the proposed parking deck. The provision of a two-station alternative in Richmond allows for a distribution of ridership, parking, and automobile traffic among the two stations. Therefore, this minimizes the infrastructure required and potential impacts associated with Main Street Station.

PRESERVATION VIRGINIA (continued)

2. The DC2RVA limits of disturbance have been the subject of a Phase IA archaeological reconnaissance and predictive model and a Phase IB survey, which included noting previously recorded sites and recording new resources in any areas where ground-disturbing activities may occur. DRPT is fully committed to conducting full archaeological studies on any area where disturbance cannot be avoided. Refer to DRPT-numbered statement #4 for additional response regarding the Area of Potential Effects.
3. The Shockoe Valley and Tobacco Row Historic District is listed in the NRHP. Refer to Chapters 3, 5, and 6 of the Final EIS for additional data on this resource. As FRA has determined, and DHR has concurred, that the Project will have an adverse effect on the district, the resource is also discussed in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS) to outline mitigations to resolve adverse effects. Regarding a possible archaeological district associated with enslaved individuals as a future study, should the City elect to pursue such a district, Chapter 3 presents a narrative on this area and includes concepts for future study including a potential district.
4. DRPT and FRA focused on minimizing the infrastructure required and the limits of proposed disturbance in this area in order to avoid subsurface impacts to the extent practicable. DRPT is fully committed to conducting full archaeological studies on any significant site where disturbance cannot be avoided per Section 106 of the National Historic Preservation Act of 1966. DRPT has conversed extensively with the DHR regarding archaeological study outside of the limits of disturbance, and the DHR has concluded that preservation in place is the priority, as archaeology can be a destructive science. As such, no excavations have occurred outside of the Project limits of disturbance. For any site located within the limits of disturbance where avoidance is not possible, FRA has determined that the Project will have an adverse effect on these resources. The Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS) outlines the steps that will be taken to mitigate the adverse effects on these resources.

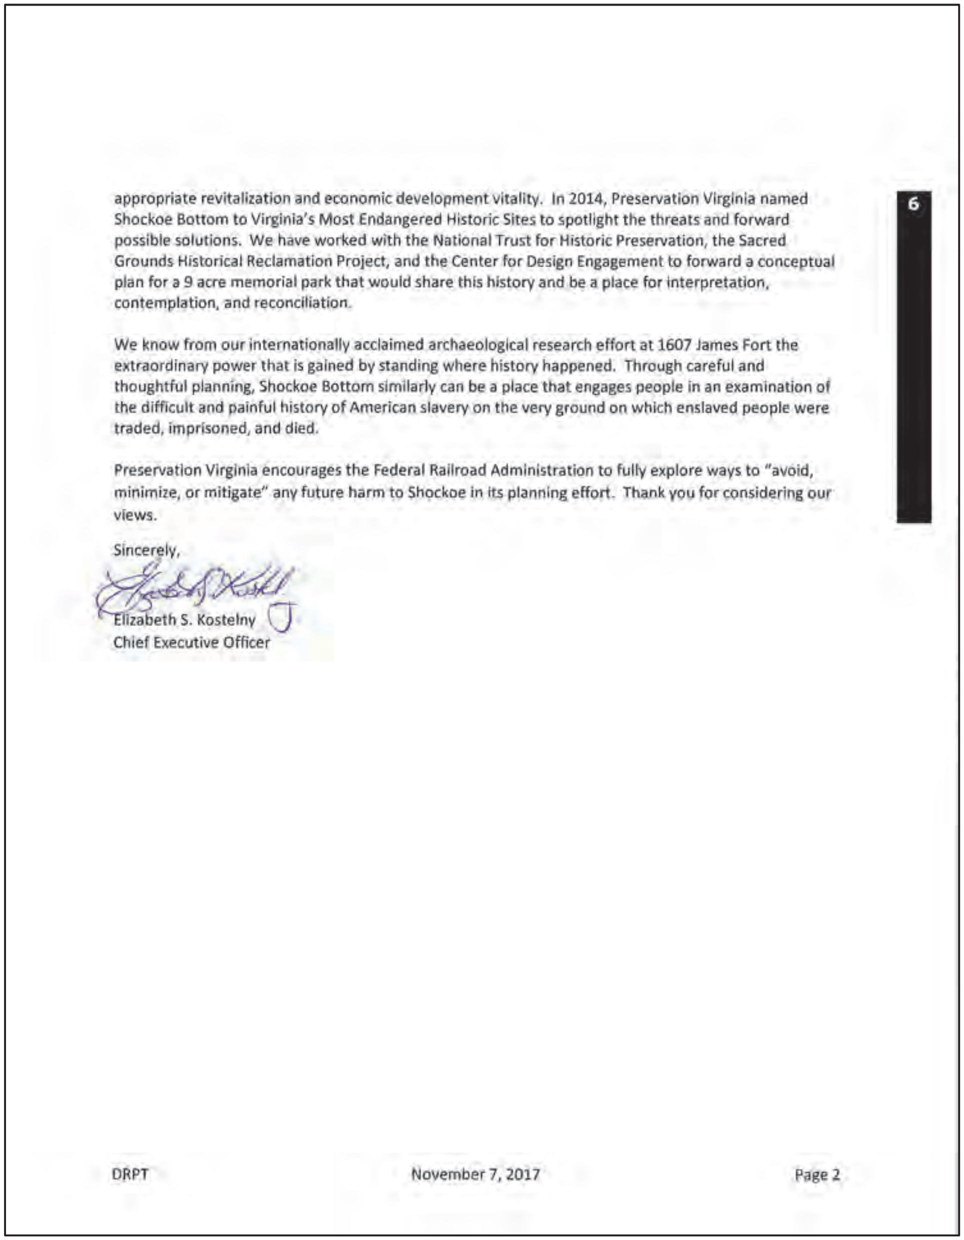
PRESERVATION VIRGINIA (continued)

5. Discussion of direct, indirect, and cumulative impacts to surviving resources at Main Street Station and Shockoe Bottom were addressed in the Draft EIS. However, FRA and DRPT have included additional information in the Chapter 3 of the Final EIS which helps the reader understand the historical context and the studies performed to date in the Shockoe Bottom area.



appropriate revitalization and economic development vitality. In 2014, Preservation Virginia named Shockoe Bottom to Virginia's Most Endangered Historic Sites to spotlight the threats and forward possible solutions. We have worked with the National Trust for Historic Preservation, the Sacred Grounds Historical Reclamation Project, and the Center for Design Engagement to forward a conceptual plan for a 9 acre memorial park that would share this history and be a place for interpretation, contemplation, and reconciliation.

We know from our internationally acclaimed archaeological research effort at 1607 James Fort the extraordinary power that is gained by standing where history happened. Through careful and thoughtful planning, Shockoe Bottom similarly can be a place that engages people in an examination of the difficult and painful history of American slavery on the very ground on which enslaved people were traded, imprisoned, and died.

Preservation Virginia encourages the Federal Railroad Administration to fully explore ways to "avoid, minimize, or mitigate" any future harm to Shockoe in its planning effort. Thank you for considering our views.

6

Sincerely,

Elizabeth S. Kostelny
Chief Executive Officer

Richmond, VA 23219

Dear Mrs. Stock:

The Hampton Roads Chamber (HRC) appreciates the opportunity to offer comments on the DC2RVA Environmental Impact Study that is considering an increase in the speed and frequency of passenger train service in the Richmond to Washington, DC corridor. While we support improved passenger service in Virginia and particularly to Hampton Roads, we encourage pursuit of this goal without harming freight service that is vital to our economy. 1

The HRC is the premier pro-business organization in the region, advocating for public policies to grow the region's businesses and economy. Many of our members and businesses in the region depend on safe, dependable and efficient freight rail service provided by CSX Transportation (CSXT) to move goods to and from their customers and most of this freight travels on the busy CSXT corridor between Richmond and Washington, D.C.

In a recent annual report from CBRE, a leading national commercial real estate firm, ranking the top 15 ports in the U.S. and Canada, The Port of Virginia was 5th, up from 9th last year. Currently, 37% of cargo at the Port of Virginia is moved on rail, the highest percentage of any port on the East Coast, with the goal of reaching 40% by rail. The Port of Virginia and many of our members depend on reliable and efficient freight rail service to meet this projected growth and remain competitive with other East Coast ports. 2

Before new passenger trains are added to this corridor, sufficient infrastructure and rail capacity must be in place to accommodate the current and future freight demands as well as the new passenger service. 3

STRATEGIC PARTNERS

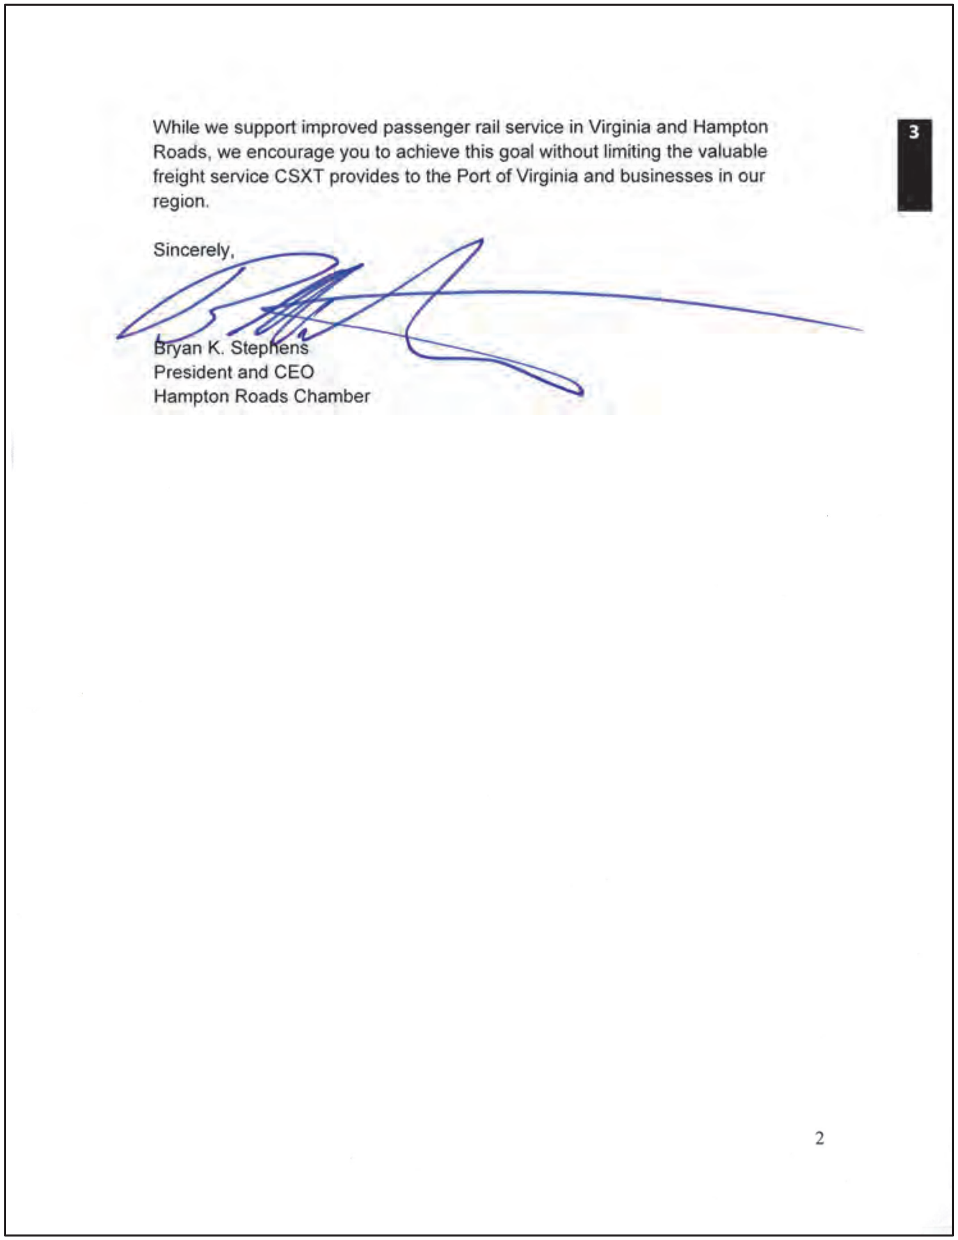
HAMPTON ROADS CHAMBER

1. The DC2RVA Project proposes to accommodate efficient movement of rail freight traffic in the DC2RVA Corridor. The Project's stated Purpose is to increase railroad capacity between Washington, D.C. and Richmond, VA, not only to deliver improved passenger rail service, but also to support the planned expansion of Virginia Railway Express (VRE) commuter rail service and accommodate the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. Improvements to freight rail operations in the corridor would also encourage economic development by increasing freight traffic through Virginia's ports, and present an opportunity for greater diversion of freight transport from congested highways to rail.
2. The Department of Rail and Public Transportation (DRPT) recognizes that the Port of Virginia is a major source of economic growth for the Commonwealth. Over the next 20 years, containerized cargo volume coming into the United States is expected to triple, far surpassing the capacity of existing United States ports. Much of this containerized cargo would be transported by rail, including freight trains along the DC2RVA corridor.

(Response to comment 3 on next page)



While we support improved passenger rail service in Virginia and Hampton Roads, we encourage you to achieve this goal without limiting the valuable freight service CSXT provides to the Port of Virginia and businesses in our region.

3

Sincerely,

Bryan K. Stephens
President and CEO
Hampton Roads Chamber

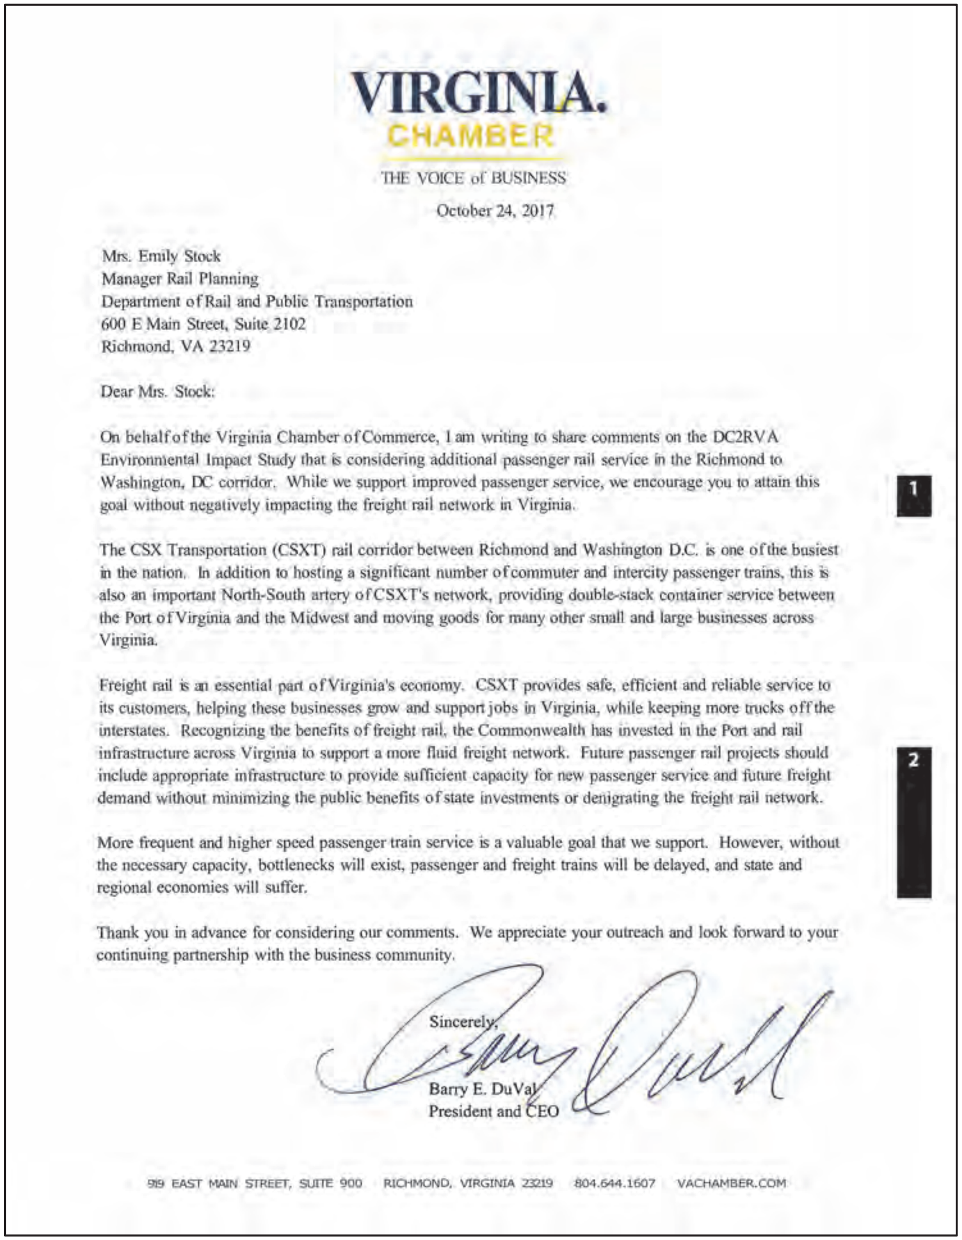
2

HAMPTON ROADS CHAMBER (continued)

3. DRPT conducted preliminary operations simulation modeling to estimate rail performance in the corridor, including impacts to freight rail. The preliminary operations simulation modeling has focused on verifying that the DC2RVA Project's proposed rail capacity improvements would meet the DC2RVA Project's Purpose and Need, and specifically would meet intercity passenger train and freight service performance goals established in the Passenger Rail Investment and Improvement Act (PRIIA).

   The operations simulation modeling incorporated increases in freight train frequencies projected through the year 2045. To determine projected freight train growth for the operations simulations, DRPT used CSXT input derived from the U.S. Department of Transportation's Freight Analysis Framework (FAF) to forecast how rail freight traffic in the corridor would increase and change through the year 2045. While CSXT's actual freight growth may be greater or less than the projected growth rates based on market demands, both DRPT and the Federal Railroad Administration (FRA) concluded that the FAF provided a reasonable basis for estimating future freight movement.

   Refer to Section 3.2 of the Final EIS and its Appendix F for details of the operations modeling process.



VIRGINIA.
CHAMBER
THE VOICE of BUSINESS

October 24, 2017

Mrs. Emily Stock
Manager Rail Planning
Department of Rail and Public Transportation
600 E Main Street, Suite 2102
Richmond, VA 23219

Dear Mrs. Stock:

On behalf of the Virginia Chamber of Commerce, I am writing to share comments on the DC2RVA Environmental Impact Study that is considering additional passenger rail service in the Richmond to Washington, DC corridor. While we support improved passenger service, we encourage you to attain this goal without negatively impacting the freight rail network in Virginia.

1

The CSX Transportation (CSXT) rail corridor between Richmond and Washington D.C. is one of the busiest in the nation. In addition to hosting a significant number of commuter and intercity passenger trains, this is also an important North-South artery of CSXT's network, providing double-stack container service between the Port of Virginia and the Midwest and moving goods for many other small and large businesses across Virginia.

Freight rail is an essential part of Virginia's economy. CSXT provides safe, efficient and reliable service to its customers, helping these businesses grow and support jobs in Virginia, while keeping more trucks off the interstates. Recognizing the benefits of freight rail, the Commonwealth has invested in the Port and rail infrastructure across Virginia to support a more fluid freight network. Future passenger rail projects should include appropriate infrastructure to provide sufficient capacity for new passenger service and future freight demand without minimizing the public benefits of state investments or denigrating the freight rail network.

2

More frequent and higher speed passenger train service is a valuable goal that we support. However, without the necessary capacity, bottlenecks will exist, passenger and freight trains will be delayed, and state and regional economies will suffer.

Thank you in advance for considering our comments. We appreciate your outreach and look forward to your continuing partnership with the business community.

Sincerely,

Barry DuVal

VIRGINIA MARITIME
ASSOCIATION

October 17, 2017

Mrs. Emily Stock
Manager Rail Planning
Department of Rail and Public Transportation
600 E Main Street, Suite 2102
Richmond, VA 23219

Dear Mrs. Stock:

The Virginia Maritime Association (VMA) represents over 450 member businesses directly and indirectly engaged in the flow of waterborne commerce through Virginia's ports. As the "Voice of Port Industries", representing these interested parties, we write to provide comment on the DC2RVA Environmental Impact Study that proposes to increase the frequency and speed of passenger train service in the Richmond to Washington, DC corridor. We appreciate efforts to provide improved passenger rail service in the Commonwealth and the opportunity to share our thoughts on this project.

VMA's mission is to "promote, protect and encourage international and domestic commerce through Virginia's ports." The Virginia maritime community is a vibrant, growing part of the state's economy and freight rail is an essential component of our industry. The DC2RVA rail corridor between Richmond and Washington, D.C. is part of the freight rail corridor that serves as a primary artery for moving goods between the Port of Virginia and markets in the Midwest.

The Port of Virginia and our members rely on efficient and reliable freight service in this corridor to compete and grow their business. We are concerned that increases in the number and speed of passenger trains without sufficient infrastructure to accommodate anticipated freight growth will constrain capacity, create bottlenecks, and disrupt service on which our members and their customers depend.

As the Commonwealth considers improvements to passenger service in Virginia, we encourage a comprehensive assessment of impacts to freight rail and taking steps to ensure efficiencies in the freight rail system that will meet the current and future needs to serve our member businesses and a growing Port of Virginia. 1

Sincerely,

David White
Vice President

Re: Comments regarding the Washington to Richmond Tier II Draft Environmental Impact Statement

Dear Ms. Stock:

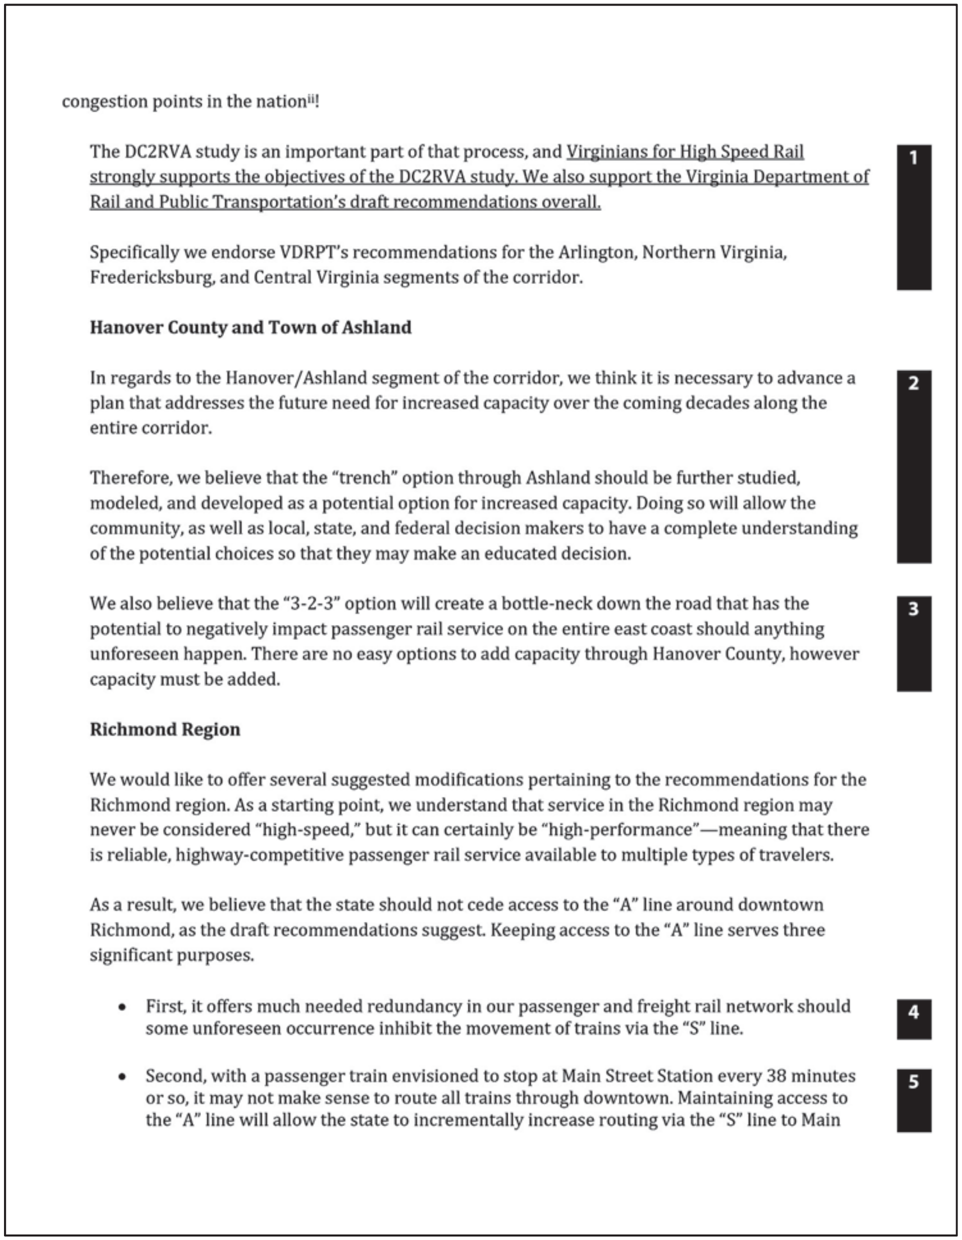
I am writing on behalf of Virginians for High Speed Rail (VHSR), the Commonwealth's largest rail advocacy organization who promote fast, frequent, and reliable intercity passenger rail service linking our communities to destinations across the nation. Thank you for the opportunity to submit our public comments regarding the Tier II Draft Environmental Impact Statement (DEIS) for the Washington, DC to Richmond High Speed Rail (DC2RVA) project.

Let me say first, and foremost, that we strongly believe that this study needs to be completed in a timely manner. It has been nearly a decade and a half since the federal Tier I of the DC2RVA study was completed, and nearly eight years since this study was funded. The time to get this done is now.

We realize, as has anyone who has ever traveled on I-95 between Washington, DC and Richmond, VA that the DC2RVA corridor is critical to the movement of people and freight throughout Virginia and along the eastern seaboard. It is a crucial segment of the Southeast High Speed Rail Corridor, as well as an important connector to the Northeast Corridor. Improving the Washington to Richmond corridor to high performance rail standards has to be one of the Commonwealth's top transportation priorities.

According to the Weldon Cooper Center at the University of Virginia, by 2040[i] the Commonwealth's Urban Crescent will be home to another 2.1 million Virginians. That's a 40.8 percent increase in population! If nothing is done this will likely result in a 1.7 million increase in registered vehicles, a 45.5 percent increase in highway traffic, a 29.6 percent increase in the amount of fossil fuels for transportation that are burned, and an increase of 7.2 million tons of green house gases released into our air.

Simply put, we must be prepared to do more if we don't want to end up with the top ten worst



congestion points in the nation[iii]!

The DC2RVA study is an important part of that process, and Virginians for High Speed Rail strongly supports the objectives of the DC2RVA study. We also support the Virginia Department of Rail and Public Transportation's draft recommendations overall. 1

Specifically we endorse VDRPT's recommendations for the Arlington, Northern Virginia, Fredericksburg, and Central Virginia segments of the corridor.

Hanover County and Town of Ashland

In regards to the Hanover/Ashland segment of the corridor, we think it is necessary to advance a plan that addresses the future need for increased capacity over the coming decades along the entire corridor. 2

Therefore, we believe that the "trench" option through Ashland should be further studied, modeled, and developed as a potential option for increased capacity. Doing so will allow the community, as well as local, state, and federal decision makers to have a complete understanding of the potential choices so that they may make an educated decision.

We also believe that the "3-2-3" option will create a bottle-neck down the road that has the potential to negatively impact passenger rail service on the entire east coast should anything unforeseen happen. There are no easy options to add capacity through Hanover County, however capacity must be added. 3

Richmond Region

We would like to offer several suggested modifications pertaining to the recommendations for the Richmond region. As a starting point, we understand that service in the Richmond region may never be considered "high-speed," but it can certainly be "high-performance"—meaning that there is reliable, highway-competitive passenger rail service available to multiple types of travelers.

As a result, we believe that the state should not cede access to the "A" line around downtown Richmond, as the draft recommendations suggest. Keeping access to the "A" line serves three significant purposes.

- First, it offers much needed redundancy in our passenger and freight rail network should some unforeseen occurrence inhibit the movement of trains via the "S" line. 4
- Second, with a passenger train envisioned to stop at Main Street Station every 38 minutes or so, it may not make sense to route all trains through downtown. Maintaining access to the "A" line will allow the state to incrementally increase routing via the "S" line to Main 5

VIRGINIANS FOR HIGH SPEED RAIL (continued)

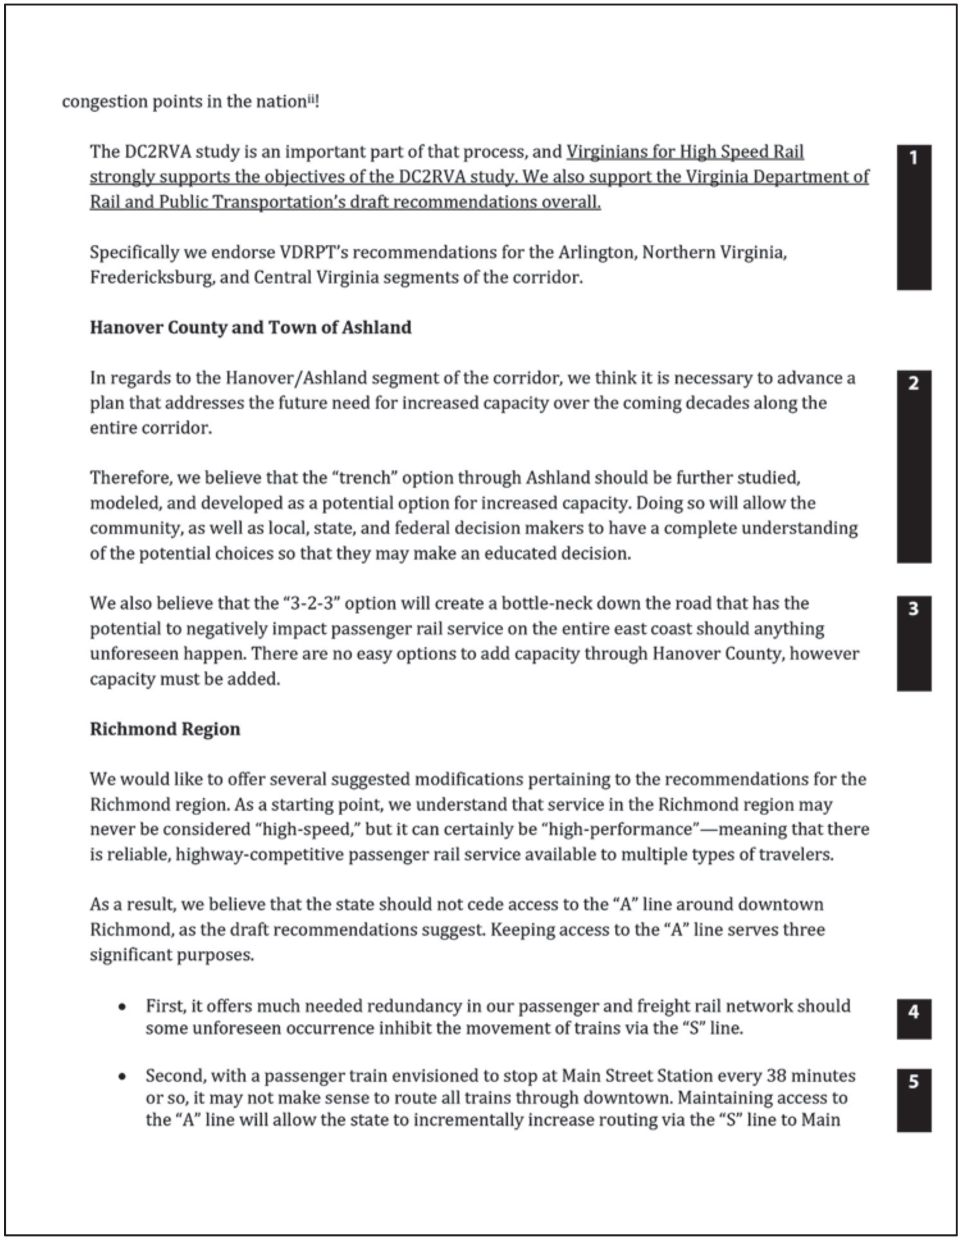
1. Comment noted. The Draft Environmental Impact Statement (EIS) recommendations for the Arlington, Northern Virginia, Fredericksburg, and Central Virginia portions of the Project corridor were selected as the Preferred Alternative in the Final EIS.

2. The Town of Ashland/Hanover County Community Advisory Committee (CAC) considered a three-track trench through Ashland and identified this option as the "least objectionable" below-ground alternative. However, the Town of Ashland did not support the trench due to potential impacts to local businesses and the community during construction and impacts to the character of the Town after the trench is placed in operation.

   Subsequently, in accordance with the September 2017 recommendation of the CAC (Appendix G of the Final EIS) and with the December 2017 resolution of the Commonwealth Transportation Board (CTB) (Appendix H of the Final EIS), Alternative 5A (the "3-2-3" option) was selected as the Preferred Alternative, which maintains the existing rail infrastructure through the Town of Ashland.

3. The Federal Railroad Administration (FRA) and DRPT, as discussed in Section 4.3.5 of the Final EIS, concluded that Alternative 5A (the "3-2-3" option) provides the railroad and roadway infrastructure required to support the railroad operations proposed in the DC2RVA Project. As presented in Chapter 5 of the Final EIS, Alternative 5A is expected to affect zero historic properties, as no additional infrastructure would be constructed within the Town of Ashland or outside of the CSXT railroad right-of-way through Hanover County, with the exception of two new highway-rail grade separations where Vaughan Road (Archie Cannon Drive) and Ashcake Road cross the corridor. Whereas all other alternatives considered in the Ashland/Hanover County Area would incur impacts to historic or protected resources; NEPA requires the selection of the "avoidance" alternative, which in this case would be Alternative 5A (Maintain Two Tracks Through Town).

(Responses are continued on next page)



congestion points in the nation[ii]!

The DC2RVA study is an important part of that process, and Virginians for High Speed Rail strongly supports the objectives of the DC2RVA study. We also support the Virginia Department of Rail and Public Transportation's draft recommendations overall. 1

Specifically we endorse VDRPT's recommendations for the Arlington, Northern Virginia, Fredericksburg, and Central Virginia segments of the corridor.

Hanover County and Town of Ashland

In regards to the Hanover/Ashland segment of the corridor, we think it is necessary to advance a plan that addresses the future need for increased capacity over the coming decades along the entire corridor. 2

Therefore, we believe that the "trench" option through Ashland should be further studied, modeled, and developed as a potential option for increased capacity. Doing so will allow the community, as well as local, state, and federal decision makers to have a complete understanding of the potential choices so that they may make an educated decision.

We also believe that the "3-2-3" option will create a bottle-neck down the road that has the potential to negatively impact passenger rail service on the entire east coast should anything unforeseen happen. There are no easy options to add capacity through Hanover County, however capacity must be added. 3

Richmond Region

We would like to offer several suggested modifications pertaining to the recommendations for the Richmond region. As a starting point, we understand that service in the Richmond region may never be considered "high-speed," but it can certainly be "high-performance"—meaning that there is reliable, highway-competitive passenger rail service available to multiple types of travelers.

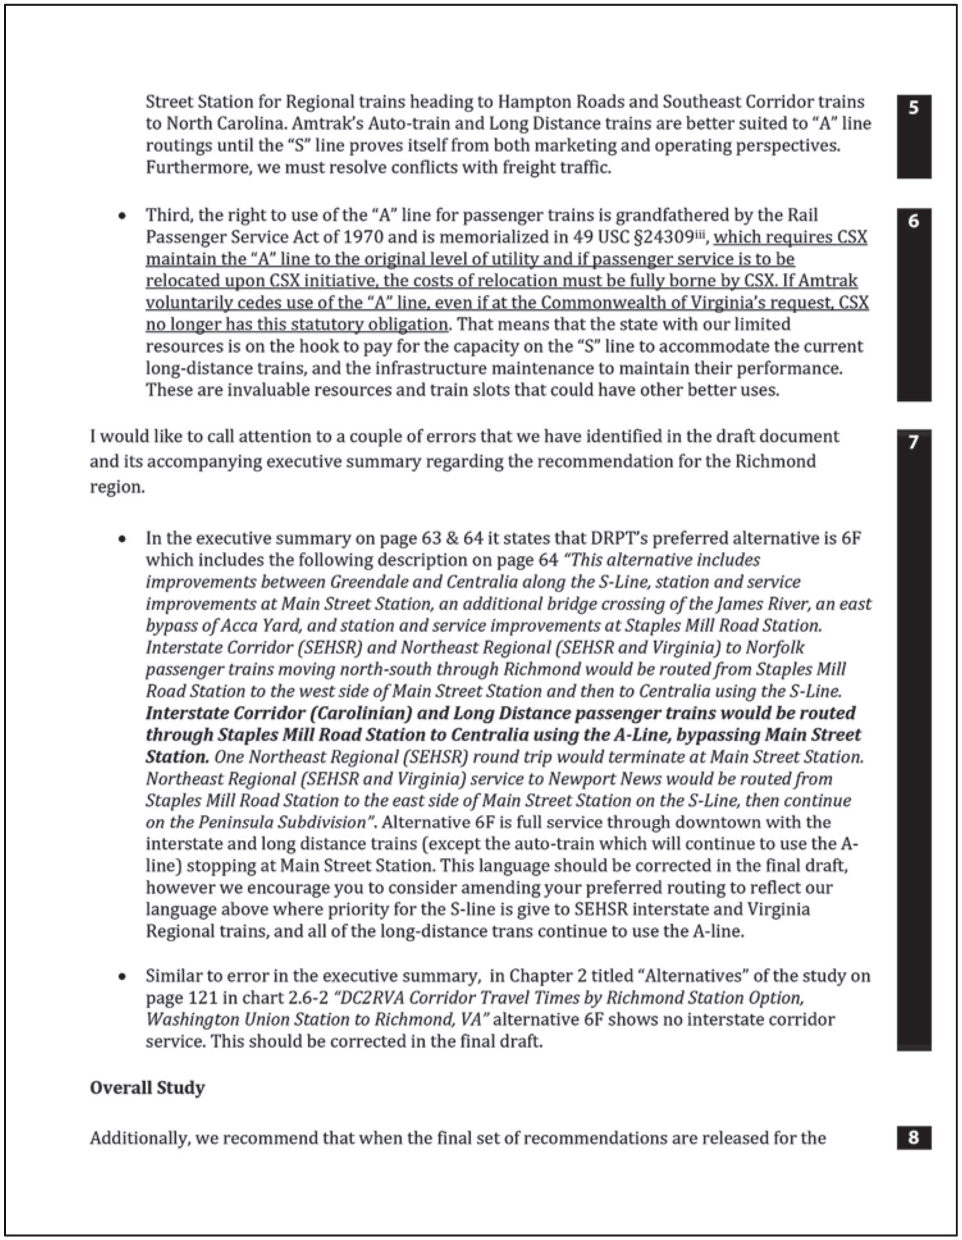
As a result, we believe that the state should not cede access to the "A" line around downtown Richmond, as the draft recommendations suggest. Keeping access to the "A" line serves three significant purposes.

- First, it offers much needed redundancy in our passenger and freight rail network should some unforeseen occurrence inhibit the movement of trains via the "S" line. 4
- Second, with a passenger train envisioned to stop at Main Street Station every 38 minutes or so, it may not make sense to route all trains through downtown. Maintaining access to the "A" line will allow the state to incrementally increase routing via the "S" line to Main 5

VIRGINIANS FOR HIGH SPEED RAIL (continued)

4 and 5. DRPT Performed detailed operations analysis of the railroad network through the Richmond section of the DC2RVA Corridor, which supported the advancement of the alternatives shifting passenger service to the S-Line through Richmond. The forecasted growth in freight traffic through the corridor in the No Build Alternative and all considered Build Alternatives as evaluated in the Draft EIS demonstrated increased demand for freight capacity on the A-Line west of downtown Richmond; however, there is limited ability to increase capacity on the A-Line due to its constrained alignment in the median of I-195 and across the James River. Through physical survey and continued operations analysis, DRPT determined that the S-Line can accommodate the construction of additional capacity to support the reroute of existing and expansion of intercity passenger rail service proposed in the DC2RVA Project. Chapter 2.6 and Appendix I (Operations Modeling) of the Draft EIS provide additional information on the operations modeling process with regard to routing in and around Richmond. Section 3.2 of the Final EIS and its Appendix F provides details of refined operations modeling that has occurred since the publication of the Draft EIS.

DRPT agrees with Virginians for High Speed Rail in its assertion that the CSXT A-Line offers much needed redundancy in the Richmond area's passenger and freight rail network should unforeseen occurrences inhibit the movement of trains via the S-line. The infrastructure improvements included in the Preferred Alternative (6F: Full Service) do not preclude use of the A-Line by passenger trains in the event of unforeseen occurrences that would prevent the use of the S-Line for passenger service, or if desired by Amtrak under its statutory authority. Under the Preferred Alternative, Amtrak's Auto Train would continue to use the A-Line.



Street Station for Regional trains heading to Hampton Roads and Southeast Corridor trains to North Carolina. Amtrak's Auto-train and Long Distance trains are better suited to "A" line routings until the "S" line proves itself from both marketing and operating perspectives. Furthermore, we must resolve conflicts with freight traffic. 5

- Third, the right to use of the "A" line for passenger trains is grandfathered by the Rail Passenger Service Act of 1970 and is memorialized in 49 USC §24309[iii], which requires CSX maintain the "A" line to the original level of utility and if passenger service is to be relocated upon CSX initiative, the costs of relocation must be fully borne by CSX. If Amtrak voluntarily cedes use of the "A" line, even if at the Commonwealth of Virginia's request, CSX no longer has this statutory obligation. That means that the state with our limited resources is on the hook to pay for the capacity on the "S" line to accommodate the current long-distance trains, and the infrastructure maintenance to maintain their performance. These are invaluable resources and train slots that could have other better uses. 6

I would like to call attention to a couple of errors that we have identified in the draft document and its accompanying executive summary regarding the recommendation for the Richmond region. 7

- In the executive summary on page 63 & 64 it states that DRPT's preferred alternative is 6F which includes the following description on page 64 *"This alternative includes improvements between Greendale and Centralia along the S-Line, station and service improvements at Main Street Station, an additional bridge crossing of the James River, an east bypass of Acca Yard, and station and service improvements at Staples Mill Road Station. Interstate Corridor (SEHSR) and Northeast Regional (SEHSR and Virginia) to Norfolk passenger trains moving north-south through Richmond would be routed from Staples Mill Road Station to the west side of Main Street Station and then to Centralia using the S-Line.* ***Interstate Corridor (Carolinian) and Long Distance passenger trains would be routed through Staples Mill Road Station to Centralia using the A-Line, bypassing Main Street Station.*** *One Northeast Regional (SEHSR) round trip would terminate at Main Street Station. Northeast Regional (SEHSR and Virginia) service to Newport News would be routed from Staples Mill Road Station to the east side of Main Street Station on the S-Line, then continue on the Peninsula Subdivision"*. Alternative 6F is full service through downtown with the interstate and long distance trains (except the auto-train which will continue to use the A-line) stopping at Main Street Station. This language should be corrected in the final draft, however we encourage you to consider amending your preferred routing to reflect our language above where priority for the S-line is give to SEHSR interstate and Virginia Regional trains, and all of the long-distance trans continue to use the A-line.
- Similar to error in the executive summary, in Chapter 2 titled "Alternatives" of the study on page 121 in chart 2.6-2 *"DC2RVA Corridor Travel Times by Richmond Station Option, Washington Union Station to Richmond, VA"* alternative 6F shows no interstate corridor service. This should be corrected in the final draft.

Overall Study

Additionally, we recommend that when the final set of recommendations are released for the 8

VIRGINIANS FOR HIGH SPEED RAIL (continued)

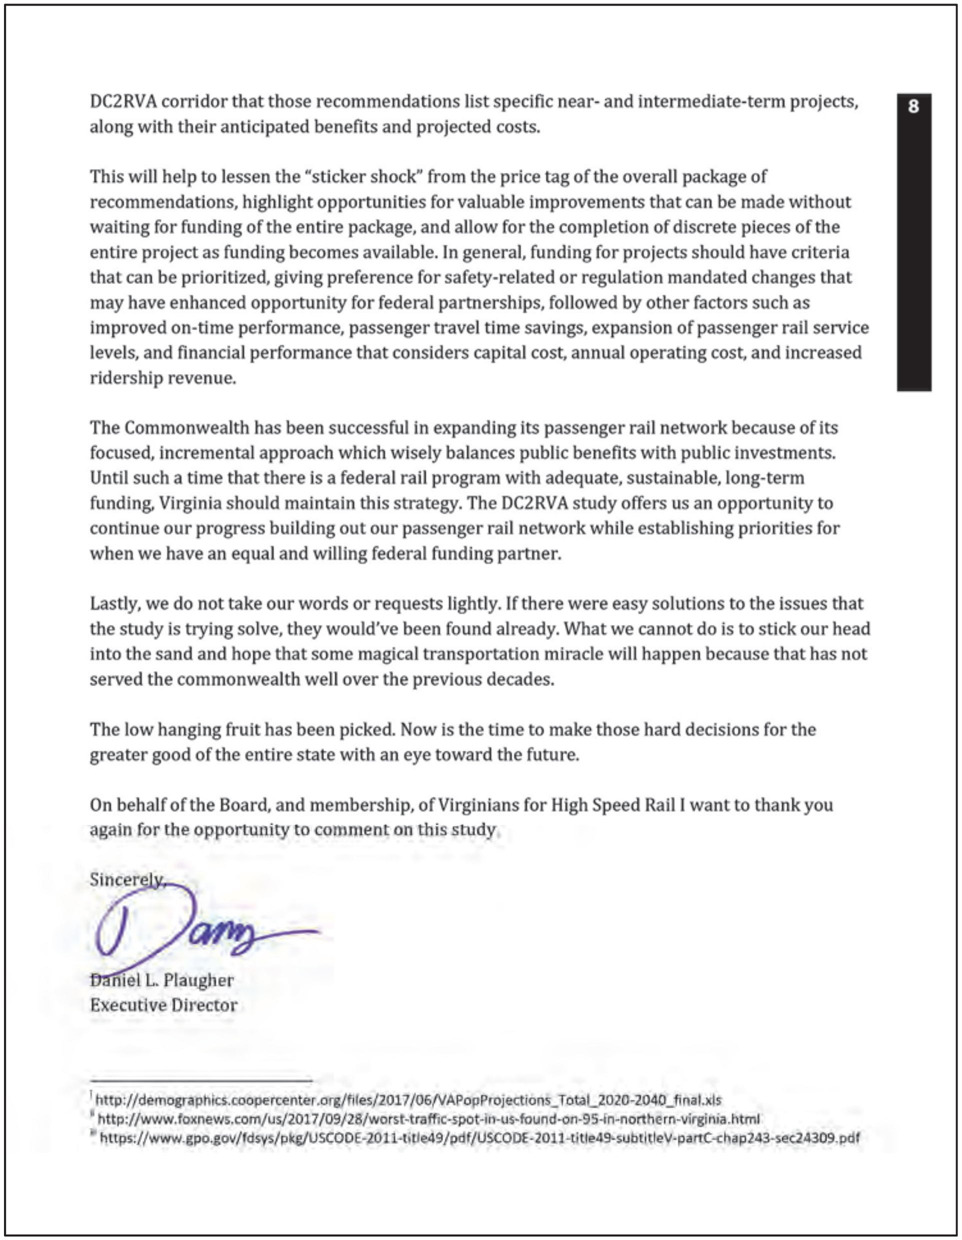
(Response to comment 5 on previous page)

6. Build-out of the proposed DC2RVA improvements and full implementation of proposed intercity passenger service is dependent on future state and federal funding, as described in Chapter 7 of the Final EIS (which has been added since the Draft EIS) to present information on future steps of the Project. Operating agreements for train slots on the CSXT-owned A-Line and S-Line, and along the entire DC2RVA corridor for planned future intercity passenger trains, would be the subject of future negotiations between CSXT, the Commonwealth of Virginia, and Amtrak, after the Project has final approvals and funding is available to support incremental final design and construction. DRPT recognizes Amtrak's statutory authority to operate over any route desired, subject to the jurisdiction of the Surface Transportation Board (STB); however, FRA and DRPT have defined the Preferred Alternative for the DC2RVA Project to provide the most feasible opportunity to construct, deliver, and sustain intercity passenger and freight train operations for the foreseeable future.

7. DRPT agrees that an incorrect summary of Build Alternative 6F with regard to service at Main Street Station was provided in the "Recommended Preferred Alternative" section of the Draft EIS Executive Summary (the full detailed descriptions provided in Chapters 2 and 7 of the Draft EIS were correct). The Draft EIS Executive Summary text has been corrected; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS. Additionally, DRPT has ensured that all descriptions of Alternative 6F are correct in the Final EIS.

   The Build Alternative 6F and Build Alternative 6G rows in Draft EIS Table 2.6-2 were inadvertently switched; the data showing for Build Alternative 6F in the table is appropriate and accurate for Build Alternative 6G, and vice versa. This correction has been made in the Final EIS; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

(Response to comment 8 on next page)



DC2RVA corridor that those recommendations list specific near- and intermediate-term projects, along with their anticipated benefits and projected costs.

This will help to lessen the "sticker shock" from the price tag of the overall package of recommendations, highlight opportunities for valuable improvements that can be made without waiting for funding of the entire package, and allow for the completion of discrete pieces of the entire project as funding becomes available. In general, funding for projects should have criteria that can be prioritized, giving preference for safety-related or regulation mandated changes that may have enhanced opportunity for federal partnerships, followed by other factors such as improved on-time performance, passenger travel time savings, expansion of passenger rail service levels, and financial performance that considers capital cost, annual operating cost, and increased ridership revenue.

The Commonwealth has been successful in expanding its passenger rail network because of its focused, incremental approach which wisely balances public benefits with public investments. Until such a time that there is a federal rail program with adequate, sustainable, long-term funding, Virginia should maintain this strategy. The DC2RVA study offers us an opportunity to continue our progress building out our passenger rail network while establishing priorities for when we have an equal and willing federal funding partner.

Lastly, we do not take our words or requests lightly. If there were easy solutions to the issues that the study is trying solve, they would've been found already. What we cannot do is to stick our head into the sand and hope that some magical transportation miracle will happen because that has not served the commonwealth well over the previous decades.

The low hanging fruit has been picked. Now is the time to make those hard decisions for the greater good of the entire state with an eye toward the future.

On behalf of the Board, and membership, of Virginians for High Speed Rail I want to thank you again for the opportunity to comment on this study.

Sincerely,

Danny

Daniel L. Plaugher
Executive Director

VIRGINIANS FOR HIGH SPEED RAIL (continued)

8. Complete build-out of the corridor and full implementation of the DC2RVA improvements (and realization of all Project benefits) is dependent on future funding. DRPT anticipates the DC2RVA Project would be implemented incrementally, as funding becomes available. The funding for the Project is anticipated to come from multiple sources, including federal, state, and local funds, plus passenger fare revenue recovery and private sector sources. Subsequent to the Final EIS, DRPT is developing a Corridor Service Development Plan (refer to Section 7.3 of the Final EIS for details) that addresses likely phasing of improvements and Project benefits, including additional train service and improved reliability. This would not preclude upgrading stations, or constructing highway-rail grade separations or at-grade crossing improvements, independently of the DC2RVA Project, should federal, state, local, or other funding become available.

APPENDIX C

DETAILED RESPONSES TO GENERAL PUBLIC COMMENTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix C

DETAILED RESPONSES TO GENERAL PUBLIC COMMENTS

As described in Chapter 2 of the Final EIS, the general public submitted more than 14,000 comments regarding the Project during the 30-day comment period and public hearing process that followed the September 2017 publication of the Draft Environmental Impact Statement (Draft EIS) for the DC2RVA Project. Most comments came from individuals living, working, or having property interests in the Project corridor, particularly within the Town of Ashland, Hanover County, and the City of Richmond. In accordance with 40 CFR 1503.4, the Virginia Department of Rail and Public Transportation (DRPT) carefully reviewed each comment, concern, and request and compiled them into broad subject matter categories, which generally parallel the chapter structure of the Draft and Final EIS documents, for presentation within this appendix:

- Study Process
  - Purpose and Need
  - Proposed Train Service/ Operations/Schedule
  - Public Involvement
  - Other Considerations
- Evaluation of Alternatives
  - Corridor Options Not Evaluated in the Draft EIS
  - Ashland Area Alternatives
  - Richmond Area Alternatives
  - Station Evaluation
- Funding, Implementation, and Construction
- Environmental Impacts
  - General
  - Traffic/Transportation
  - Right-of-Way/Displacements/ Property Values
  - Land Use
  - Community Facilities/Title VI/ Environmental Justice
  - Farmland
  - Bicycle and Pedestrian Facilities
  - Cultural Resources
  - Natural and Water Resources
  - Noise and Vibration
  - Air Quality
  - Visual / Aesthetics
  - Hazardous Materials
  - Indirect and Cumulative Effects
  - Safety

This appendix provides detailed responses from DRPT and the Federal Railroad Administration (FRA) to address substantive comments within the above topic areas. In general, substantive comments are those that question, with reasonable basis, the accuracy of information and methodology in the Draft EIS or present new information not considered in the Draft EIS, and cause changes or revisions in one or more alternative or environmental resource as part of the Final EIS. Many individuals commented on topics that did not warrant changes to methodology or information provided in the Draft EIS, such as:

- Suggestion of additional alternatives to consider, most of which were considered but dismissed during the 2002 Tier I EIS for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC, or do not align with the implementing actions that were the outcome of the 2002 Tier I EIS and Record of Decision (ROD).
- Request for detailed information or data that is beyond the scope of an environmental document and would be developed during the final design and permitting process.
  - Environmental impact assessments for the Project are based on conceptual engineering, which is approximately a 10% design level. Chapter 5 of the Final EIS clarifies the use of temporary and permanent impacts on environmental resources. Temporary impacts at the conceptual design level are a fixed offset or distance from the permanent impact limits; this is an allowance to account for possible construction means and methods that may exceed the permanent impact limits. Final design will clarify the potential construction means and methods that might be used to eliminate or mitigate temporary impacts.
  - Final design and mitigations will occur after Project funding becomes available and incremental improvements are scheduled, as explained in Chapter 7 of the Final EIS.

Notwithstanding, DRPT provided responses to these topics within the detailed responses provided in this appendix. DRPT did not provide responses to comments on overall position/opinion for or against the Project or preference for or against a specific Build Alternative that was evaluated in the Draft EIS. Additionally, DRPT addressed specific property questions directly with the property owner, separate from this response document. All comments received were considered as part of the selection process for the Preferred Alternative for this Final EIS.

The comments presented in this appendix convey the substance of the comments made, but condense similar comments together into a single topic and do not necessarily quote comments from individuals verbatim. The responses include reference to information provided in both the Draft and Final EIS, and some responses are the outcome from ongoing analyses and coordination that have occurred since the publication of the Draft EIS. DRPT and FRA do not view the public comment process as a "vote counting" process but rather one seeking substantive comments that benefit the FRA and DRPT in their final decision-making process. The public comment process is also an opportunity for the public to inform FRA or DRPT of potential concerns or conditions that were not identified during the preparation of the Draft EIS.

HOW TO USE THIS APPENDIX:

This general public response appendix is presented in two parts:

- **Appendix C1** lists the questions that DRPT responded to for each of the comment topic areas and provides an index to the page number in Appendix C2 where the detailed response can be found. The intent of this index is to provide a way to easily browse all questions that were asked by the general public and locate its detailed response.
- **Appendix C2** provides the detailed responses to each of the substantive comments within the previously-identified topic areas.

STUDY PROCESS

PURPOSE AND NEED

1. How is the purpose of this Project different than the previous 2002 Tier I document? C2-1
2. Why is the Project adding more trains? Existing Amtrak trains do not appear to be full, and the corridor does not appear to be a major commuter route. C2-2
3. The 2002 Tier I EIS stated that this Project should minimize impacts by using existing rail corridors. Therefore, the bypass options under consideration as part of this Project do not conform to the Tier I recommendation. C2-3
4. The Project made a recommendation based on the assumption that Long Bridge and Union Station capacity improvements will be complete, when the timeline of neither is known. C2-3
5. Concerns over area-specific capacity needs. C2-4
    a. Why is more rail capacity needed in Area 5 (Ashland) but not Area 2 (Northern Virginia)?
    b. Additional rail capacity through Area 5 (Ashland) is not needed and not appropriate.
    c. In all Build Alternatives, Ashland will become a choke point for rail traffic for the entire corridor and Project capacity goals will not be met.
6. CSXT does not support Build Alternative 5A (commonly known as the "3-2-3" option) due to capacity constraints. Why is it considered? Isn't their support required to meet the Purpose and Need of the Project? C2-4
7. The Purpose and Need is based on an analysis of the "current" Need for the Project. However, the Draft EIS stated that the Project would be constructed between 15 and 25 years from now and the projections of the demand for enhanced passenger rail and freight service are presented for between 2025 and 2045—neither of which are "current." C2-5
8. The DC2RVA proposed solutions do not demonstrate that the rail options will truly support the service growth and results required to meet the Project Purpose and Need. C2-6
    a. Why is a proposed third track needed?
    b. Are even more tracks needed?
    c. Would it be worth it from a cost-benefit perspective to add more lines as part of this Project, to plan for the future?
9. There is no point to this Project without a national plan for better passenger rail. C2-6
10. High speed rail won't meaningfully reduce vehicle traffic, which is stated as an element of the Purpose and Need. The touted reduction in I-95 congestion by adding a high speed rail in the Project documentation is not true. C2-7

PROPOSED TRAIN SERVICE / OPERATIONS / SCHEDULE

1. The lack of specific travel time saved associated with each Build Alternative in the Draft EIS suggests the Project will provide negligible benefits for unacceptable costs. C2-7

2. Amtrak service is not a reliable transportation choice. Amtrak doesn't need to be faster, just more reliable. What is this Project doing to improve the frequent delays and/or cancellations that currently occur on Amtrak? C2-7
3. The passenger trains proposed by the Project should go faster. This is not true high speed rail that other countries have. C2-8
4. Concerns about rail technology assumed and/or evaluated in the Draft EIS C2-9
    a. The Project does not use the most up-to-date technology, such as hyperloop.
    b. This type of rail is an antiquated system and is not the future of transportation.
    c. No consideration is given to the fact that rail technology is changing (as reported in Draft EIS Appendix I); this assumption should be added to the report and then defended. The contents of Draft EIS Appendix J lists five types of transportation, but fails to identify new or emerging technologies.
5. Concerns about operations of new service proposed by the Project C2-10
    a. When will the proposed trains run?
    b. Why is there no late train?
    c. Are trips seven days a week?
    d. Are trips only for commuters?
    e. Monday through Friday service is insufficient, and weekends are needed too.
6. Concerns about freight service C2-10
    a. Project forecasts of future freight should be viewed with skepticism.
    b. The Project fails to anticipate major shifts in distribution patterns for freight that will be implemented over the next 20 to 40 years.
    c. The growth in the freight capacity is an assumption that may not hold up. Data published by the Association of American Railroads shows that the number of carloads in the year 2017 to date is below the number for the years 2015 and 2016.
    d. Higher speeds are needed by freight trains.
    e. Amtrak may use the rail corridor, but over 90% of rail traffic will be CSXT freight trains.
7. Concerns about Virginia Railway Express (VRE) service C2-12
    a. Are VRE changes part of the Project?
    b. Can night and/or weekend trains to VRE be added as part of this Project?
    c. A better alternative would be to expand commuter service between Fredericksburg and Richmond by the VRE or use Mobile Diesel Units to provide service connecting with VRE.

8. Reliable travel times and schedules are an unachievable goal even if all of the recommendations of the Draft EIS were adopted because many of the trains originate outside of the corridor. The Draft EIS fails to acknowledge barriers to faster or more reliable travel times that are outside of the area of proposed DC2RVA capacity improvements, such as at Long Bridge across the Potomac River or at Washington's Union Station. The improvements will not make corridor trains a competitive alternative to automobiles and are not worth the costs to affected stakeholders. C2-13

9. Concerns about the design of track crossovers C2-14
    a. Did the Project consider upgrading all rail line crossovers along the corridor to be at least 45 mph?
    b. The current crossovers at Doswell and Milford are only 30 mph and the resulting approaching signals slow trains down farther out than is necessary, both of which results in operations delays in the corridor.

PUBLIC INVOLVEMENT

1. How are our voices being heard? C2-14
    a. Are email and written comments being processed the same way?
    b. Mass comments dilute the messages of local residents.
    c. The comment-response is an unethical process — "form" comments sent through auto-generated websites should be eliminated/should not be "counted" as equivalent to citizen comments.
    d. Will all repeat comments by a single person be counted as individual comments in the record?
    e. What is considered more helpful by the DRPT—the total number of comments for or against an option or the quality of the comments?
2. Concerns about public outreach and involvement in Area 5 (Ashland) C2-15
    a. Within Ashland, the communication and transparency with the public was lacking.
    b. Homeowners along the proposed bypass should have been included/notified earlier.
    c. Ashland is getting a disproportionate amount of time/effort. It is one small town in a 123-mile corridor that will benefit from this Project.
    d. Why did Ashland have to do something other communities have not completed (i.e., the CAC, subsequent to publication of the Draft EIS)?
3. What was the outcome of the Ashland CAC after the publication of the Draft EIS? C2-16
    a. How does it affect analyses that occurred within the Draft EIS or in the Final EIS?
    b. There needs to be a formal comment period on any recommendations in Area 5 prior to the next step in the process.
4. DRPT has ignored public input for not expanding the CSXT rails. C2-17

OTHER

1. Will this process happen again in 20 years because of infrastructure upgrade issues? C2-18
2. Opposition to CSXT's level of involvement in the Project C2-18
    a. CSXT is not funding its fair share of this Project.
    b. CSXT attempt to "control" the decision of Ashland based on their own in-house study of Project impact on CSXT.

EVALUATION OF ALTERNATIVES

CORRIDOR OPTIONS NOT EVALUATED IN THE DRAFT EIS

1. Did the Project consider improvements outside of the existing rail corridor to improve train speed (such as construction of straighter lines, separate additional rail lines, flyovers, and/or tunnels)? C2-19
2. Did the Project consider moving all freight rail away/separate from passenger rail? C2-20
   a. It is disappointing that no cost/benefit study was made of the alternative of diverting substantial numbers of freight trains to the existing rail line in Maryland along the Route 301 corridor. The expense of building a new Potomac River bridge at Dahlgren and building connecting tracks to the RF&P line would be outweighed by both the homeland security benefits of bypassing the national capital and the benefits of freeing up the Fredericksburg-D.C. line for passenger rail.
3. Did the Project consider improving highway capacity, instead of and/or in addition to rail capacity? C2-21
4. Did the Project consider rail in the I-95 corridor right-of-way and/or within powerline right-of-way? C2-21
5. Did the Project consider having two freight lines and two high speed passenger rail lines? C2-22
6. Did the Project consider a three-track option with overtaking lanes (i.e., outer tracks would handle freight traffic and inner track would be utilized for passenger rail service only, in both directions)? C2-22

ASHLAND AREA ALTERNATIVES

1. How and why was a western bypass alternative in the Ashland area brought forward as an alternative in the Draft EIS? C2-22
2. Support for options not evaluated in the Draft EIS C2-23
   a. One elevated track through downtown Ashland
   b. Tunnel beneath the Town of Ashland
   c. Bypass for vehicular traffic around Ashland
   d. Use of the existing eastern rail alignment (i.e., the Buckingham Branch Line)
3. Could the proposed alignments through the Ashland Area (Area 5) be modified have less impacts overall, especially to homes? C2-24

RICHMOND AREA ALTERNATIVES

1. How will the Project route trains on the S-Line in Richmond? Isn't exclusively using the S-Line a missed opportunity of capacity for the existing A-Line? C2-24
2. The Richmond Area improvements should be further broken down into smaller projects that will allow for the steady increase of passenger rail service at Main Street Station to Hampton Roads and the Southeast United States. C2-25

STATION EVALUATION

1. Concern about which stations are being served by new DC2RVA service throughout the corridor, why those locations were chosen, and/or suggestions of additional stations or transit services that should be added along the corridor C2-26
2. Concern about which stations are being served within Richmond, their operations, and/or their connections to other modes of travel.. C2-26
3. Concern regarding proposed level of boarding platforms at stations as part of Project improvements C2-28
    a. The Project should ensure that all platforms are at train-door level so that ADA customers do not have to utilize a lift / wait for the conductor to find a ramp at the station.
    b. Not having "high-level" platforms in this Project adds travel time to trips. It looks like the Project will have at least four stations (if not more) that are "low-level" and that's going to add at least two minutes to every train in both directions.
    c. The objections to "high-level" platforms seem to be that VRE owns equipment designed for "low-level" platforms and that freight railroads don't like "high-level" platforms, but there has to be a solution to those concerns from other places in the country.
4. Are future parking demands being addressed / increased at stations as part of this Project? C2-29
5. Station-specific concerns.. C2-30
    a. Carmel Church Station has been supported by the last three administrations and has been included in the last two Virginia State Rail plans. It was studied in depth by DRPT and affirmed in the Amtrak Station Area Planning and Land Use Analysis study from August 2008. While the Project states that it does not preclude the development of new stations, the Project should include the station that the Caroline County community has been working on with the full support of the Commonwealth.
    b. In Fredericksburg, the Project should look into renovating the current historic station as a passenger station rather than building a new station.
    c. What is happening at the Ashland Station? The Project needs to be sensitive to the aesthetics of the historic building.

ENVIRONMENTAL IMPACTS

GENERAL

1. Is there no route which would not impact local citizens? C2-31
2. The environmental impacts and/or monetary cost of the Project are not worth the projected time-savings of passenger rail. High speed rail is prohibitively expensive when compared to the time-savings for passengers using these trains. It is not fair to ask residents to "pay" for this when they will not be seeing any benefit. C2-31

TRAFFIC / TRANSPORTATION

1. Concern about safety and/or accessibility of public at-grade roadway crossings as evaluated in the Draft EIS........ C2-32
2. What is happening to the existing at-grade treatments in the corridor (public crossings)? C2-33
3. Concern over private driveway access and/or crossing treatment throughout the corridor C2-33
4. Ashland-specific traffic concerns C2-34
    a. In Ashland, the proposed alternatives would not increase safety of at-grade roadway crossings, especially at the main intersection in downtown Ashland (England Street/Thompson Street crossing).
    b. In Ashland, railway traffic currently affects traffic flow by blocking intersections up to 15 —20 minutes. This is not covered in the Draft EIS.
    c. There has not been adequate attention to how disruptive the destruction/ construction through the town of Ashland would be. Shutting down Center Street for several years will create an inconvenience to all residents.
5. Concern over access of specific crossings C2-35
    a. In the Northern Virginia Area, there is no reference to problems at Railroad Avenue in Woodbridge. If a new 2-track bridge is to be built east of the existing bridge at Occoquan Creek, what will happen to access to houses on Railroad Avenue? The properties have no legal access to a public road except by using Railroad Avenue, which belongs to CSXT. There should be a frontage road study, with pedestrian passage.
    b. In Ashland, what is the plan for the Gwathmey Church Road crossing, which serves a landlocked community? As rail traffic increases, the safety of the crossing will become more of a problem.
    c. In Ashland along the western bypass (Build Alternatives 5C and 5C-Ashcake in the Draft EIS), there are families who presently gain ingress and egress from Cross Road. With the rail corridor replacing Cross Road, what happens to property owners in this area?

RIGHT-OF-WAY / DISPLACEMENTS / PROPERTY VALUE

1. Concern about process for acquiring private property, including compensation, timing, need, and methods........ C2-36
2. How are farms addressed in the property evaluations of the Draft EIS? Are farms considered businesses? C2-37
3. It seems that people with property the railroad crosses would only be compensated for the actual amount of land used by the physical railroad, with no value given to a single property that is split into pieces by the Project, such as a farm with a barn on one side and a pasture on the other. C2-37

4. Concern about property values C2-37
    a. Since the Project might not be completed until 15—20 years from now, this Project would encumber property owners land by basically tying their hands in the ability to utilize their property rights, and the value of their property would be devalued.
    b. In the Ashland Area, concern that the impact on property values of the proposed Project is immediate. Even just the discussion of shutting down Center Street for 2—3 years is hurting real estate prices now.
5. Concern that impacts to homeowners that are not directly located on the tracks are not considered as part of the Project C2-38
6. Concern that the Draft EIS did not address the economic impact in the Ashland Area ... C2-39
    a. In the Ashland Area, concern about negative economic impact of the construction of alternatives through town. The FRA decision will have immediate economic impacts, even if it is scheduled for 15—20 years in the future.
    b. In the Ashland Area, the western bypass option will significantly impact taxpaying property owners with lower property values for homes, farms, and land. This negative economic impact will not simply affect the homes and lands in the immediate area of the proposed tracks, but many more homes, farms, and lands in the vicinity of the entire western bypass. These additional taxpaying property owners have not been included in the fact-finding efforts of the rail reports.
7. In the Richmond area, there was no discussion of any potential impacts to local industrial businesses that this Project would affect outside of the Main Street Station Area. C2-39
8. In the Ashland area, it is not clear from the Draft EIS documentation exactly how many houses are impacted by the bypass alignments? C2-40

LAND USE

1. Lansdowne Road in Spotsylvania County is currently a two-lane facility. The Draft EIS mentions a grade separation where it crosses the tracks near the City of Fredericksburg. The County Comprehensive Plan recommends a future four-lane divided roadway for Lansdowne Road that should be considered as part of this Project........ C2-40
2. In Ashland, concern how a bypass would adversely impact Hanover County growth plans and/or is not compatible with County land use plans. For properties along the bypass alignment, houses are zoned for residential, so how can a bypass be built?........ C2-40
3. In Ashland, what is the opinion that VDOT has on this western bypass which is in conflict with their planned 4-lane north and western bypass of Ashland (starting at Cross Corner Road and ending at Staples Mills (Route 33))? That study was performed in the early 1990s. Numerous town meetings were held, and the route was chosen either on or very close to existing roadways. How does DRPT propose to close off Cross Corner Road with this West Ashland Bypass and still incorporate VDOT's planned bypass? Does DRPT or FRA have the authority to supersede existing plans by VDOT?........ C2-41

COMMUNITY FACILITIES / TITLE VI / ENVIRONMENTAL JUSTICE

1. Concern over Title VI and environmental justice (EJ) populations.................................... C2-41
    a. Will the Project affect more environmental justice (EJ) communities than non-EJ communities? If so, are there viable alternative routes which would have less of an impact on an EJ community and why haven't they been chosen?
    b. What specific actions have been taken to ensure that minority and/or low-income communities are not disproportionately affected by the construction and use of high speed rail? How will coordination with these communities be conducted?
2. It is discrimination that the Project does not include roll on / roll off level platforms at all stations. C2-42
3. Is Long Bridge Park affected by the Project? C2-42
4. Concern that the third rail options through Ashland do not appropriately consider impacts to Randolph-Macon College.. C2-43
5. Concern about specific community facilities located along the bypass alignments in Ashland C2-43
    a. To Independence Christian Church from the Western Bypass alternatives in the Ashland Area (Build Alternative 5C and 5C-Ashcake).
    b. To Kiddie Kingdom (a non-profit child care center) from the Western Bypass alternatives in the Ashland Area (Build Alternative 5C and 5C-Ashcake).
6. What is impact to Leesylvania State Park? C2-43
7. No consideration was made for any individuals with disabilities, who would be impacted by the sound and vibrations from a rail being close to houses along the Ashland Western Bypass alignment. C2-43

FARMLAND

1. The proposed Project would impact acres of land that are currently farmed. Not only does this mean that farmers would be unable to farm the land, but it could be impossible to leave cattle in pastures split by a train track. Does the Project account for these ramifications? C2-44
2. The Project should uphold the Farmland Protection Act and the Local Agriculture Districts Act quoted in the Draft EIS which were put in place to minimize the conversion of the Commonwealth's farmland to nonagricultural uses... C2-44
3. The dairy industry is in peril all on its own. Over the last 15 years dairies in Hanover have diminished and warrant protection. C2-45

BICYCLE AND PEDESTRIAN FACILITIES

1. Concern regarding consideration/accommodation of bicycle and pedestrian facilities .. C2-45
    a. It is an oversight that the Project does not include a parallel greenway. The Project corridor should include a multiuse path that connects to trailways that are in place or planned along the corridor, such as the East Coast Greenway.

   b. The Draft EIS did not focus enough on bicycle and pedestrian facilities. Bicycle and pedestrian facilities should be considered and accommodated as part of at-grade and/or grade separated crossings.
   c. Walking over the tracks is an impediment and impossible for wheelchairs and mobility aids. How does the Project improve these problems?
2. Will bicycles be allowed / accommodated for on all the new trains? If not, why? C2-46
3. Ashland is home to the intersection of Bicycle Routes 1 and 76. The Draft EIS did not consider these trails that would be impacted by all through-town build alternatives...................... C2-47

CULTURAL RESOURCES

1. Concern regarding the Main Street Station options in Richmond and their impact on the Shockoe Bottom Area and the cultural resources related to slave trade in the area, including the footprint of the "Burial Ground for Negros", Lumpkins Jail/Devil's Half Acre, and/or the proposed Memorial Park. Concern that impacts to these resources, either individually or as a whole, were not fully considered within the Draft EIS.. C2-47
2. Concern regarding the third-rail options through Ashland and their impact on the historic districts / properties, including the potential Berkleytown Historic District. The Section 106 study revealed buildings that are potentially eligible for individual listing. Aren't historic districts and buildings elevated to individual listings supposed to be protected?............ C2-50
3. In the Ashland Area, how did cultural resources studies along the bypass alignment differ from those along the main corridor through Ashland? Have any studies been conducted on any potential structural changes that may occur to these properties due to additional freight and passenger rail trains?... C2-51
4. Concern regarding the Rosemont Historic District in Alexandria C2-51
5. In Ashland, residents living along the tracks receive tax credits from the state to maintain and preserve historic homes. How will this be impacted by the Project?................................. C2-51
6. In Ashland, the Commonwealth has invested in the town itself to preserve its historic character. Any three-track option through town would be at odds with those state-sponsored efforts—how does the document account for this investment?... C2-52
7. The Draft EIS did not give adequate consideration to the impact on the cultural, archeological, and historic site of Ferry Farm, George Washington's boyhood home. Currently Stafford County is re-configuring the entrance road to this cultural site to align with the Ferry Road and Route 3 (Kings Highway) intersection, which would be directly across from the rail crossing of Ferry Road on the Dahlgren spur (relevant to the 3C option). C2-52

NATURAL AND WATER RESOURCES

1. How will the Project reduce and/or mitigate the effects on the groundwater and private wells throughout the construction and long-term operation of the railways? Will the Project be assessed for its potential to contaminate water supplies under the Safe Water Drinking Act amendments? How will these specific potential sources of pollution be monitored and addressed so that contamination is minimized to the lowest levels possible? Are there measures in place for how to address a contamination episode if one occurs due to the Project?

A testing and alert mechanism for contaminated water should be implemented in order to ensure groundwater stays clean and safe for use. C2-53

2. How will the Project protect flood zones / wetlands or get approval from DEQ to build in these areas? More must be done to absorb the cost of losing wetland ecosystems. C2-53
3. The effects of sea level rise are not considered by the Draft EIS. Currently, there are stretches along the corridor where the water seems to be lapping at the tracks already. That's going to be a growing problem and needs to be addressed. C2-54
4. Concern over "missed" natural and/or water resources in the Ashland Area along the Western Bypass alternatives (Draft EIS Build Alternatives 5C and 5C-Ashcake)............. C2-55
    a. In the Ashland Area, the proposed bypass (Build Alternatives 5C and 5C-Ashcake in the Draft EIS) would kill a Giant Sequoia on the land at 12311 Elmont Road.
    b. In the Ashland Area, a property owner along the Western Bypass (Draft EIS Build Alternative 5C and 5C-Ashcake) found a male (red eyed) eastern box turtle. Its roaming radius is approximately 1 mile.
    c. In the Ashland Area, property along the Western Bypass (Draft EIS Build Alternative 5C and 5C-Ashcake) has wetlands and flood zone areas. If property owners cannot build in this area, how is it legal to build a train track? The number of trees that will have to be cut and soil that will have to be disturbed will be devastating. The DEQ of VA website seems very clear that it can't happen. These areas are also home to native wildlife such as deer fox owls and eagles, which could become landlocked if the Project is built.
5. As our region and state see more traffic, investment in Long Bridge across the Potomac is a critical component to handle growth in Amtrak and VRE and freight. All that construction must meet high standards for sediment and erosion control and long-term stormwater management. C2-56
6. What is the plan for design of bridge openings over navigable waterways, including Neabsco Creek? C2-56

NOISE AND VIBRATION

1. Concern about what noise and /or vibration studies have been conducted as part of the Project C2-57
    a. How will noise and vibration of high speed rail compare to current Amtrak, CSXT, and commuter trains?
    b. Noise and vibration levels were not studied for all traffic that would travel on new line such as freight and other passenger trains.
    c. The effects of increased weight from heavier and longer trains and the increases in the future were not considered, nor is the closer distance about 15 feet considered.
    d. What about impacts due to existing trains or when existing trains pass by each other? This Project will increase the ability of other trains to move more quickly. What would the vibration and noise impacts be of increased speeds of these other trains?
    e. The noise impact assessment failed to assess and compare current noise exposure versus projected future in terms of length of time of exposure and any increases in decibels.
    f. Concern over impact to underground pipelines within the railroad easement, especially since some of these may be very old and not withstand increased vibrations from the Project.

2. Concern about noise and vibration mitigation.. C2-59
   a. What noise and vibration mitigations are occurring? Residences already have noise impacts and/or shaking of homes when the trains go past, which will get worse with the addition of new rails. Can an impact study and/or mitigation (natural and/or manmade, i.e., noise barriers) be completed? Are you going to pay for damage that the Project does to homes shaking?
   b. Concern that Draft EIS does not detail mitigation. When will residents know whether the severely impacted residential areas will be looked at for noise barriers? Will mitigation include sound walls and / or requests for sound walls?
3. Concern about noise and vibration during construction, which doesn't seem to be evaluated in the Draft EIS.. C2-60
4. The noise and vibrational impact section of the Draft EIS falls far short of describing, if not actively disguises, the increased vibrational and noise impact that another set of tracks and the resulting increased high speed train and freight traffic will have on the livability of the surrounding neighborhoods. The report fails to note that some homes are all built on marine clay. This is in contrast to what the report says, which states that the soil on which the tracks are built minimally conducts vibration or noise. The Project should mandate slow moving trains and lighter trains and enforce these regulations. C2-60
5. If adequate engineering studies had been done, the conclusion would be that many of the historic homes along the corridor would not be able to withstand the construction / drilling impact that will occur because of the Project. C2-61
6. Why has no one has done a noise and vibration study on any of the houses on Mount Vernon Avenue near King Street Metro? Due to the proximity of these houses to the tracks, such a study should have been a priority for this EIS to be taken seriously.................................. C2-61
7. Concern about train horn use C2-61
   a. There are existing quiet zones in the corridor to prevent the trains from blowing horns. The Project should establish new quiet zones in other areas throughout the corridor?
   b. Will the Project significantly decrease frequency and decibels of train horns?
   c. The process for evaluating locomotive air horn noise in Crystal City and Alexandria is flawed. 110 decibels is in the Code of Federal Regulations, but that level of air horn noise is an issue.

AIR QUALITY

1. The Draft EIS doesn't seem to reflect the reduction in highway emissions that could occur if more people chose to travel by rail. C2-62
2. Increased train traffic from the Project will cause an environmental burden on the people living next to the tracks because of the additional diesel fumes and related emissions which impact the air quality, which was not addressed in the Draft EIS. C2-62
3. There is no consideration given to air quality during construction in the Draft EIS. There will be fumes and noises coming from construction that it will be unhealthy to residents and their posterity. C2-63

VISUAL/ AESTHETIC

1. How are visual impacts evaluated, both throughout the corridor and within historic downtown Ashland streetscape specifically? C2-63
2. Page 3-54 of the Draft EIS lays out the definition of Visual Resources: “Viewers in visually sensitive resource areas are typically involved in outdoor activities where their sensitivity to the surrounding visual environment may be heightened.” However, later on page 3-66 of the Draft EIS, it states in regard to VAU 5-2 or the western bypass of Ashland that “no sensitive visual resources are identified within this unit.” This is incorrect, as bicyclists, walkers, and joggers frequent Yowell Road and the private residences there. This area of private residences provides a visual resource to viewers traveling in this VAU and should be taken into consideration in the final copy of the EIS given its regular recreational use. C2-64
3. The Project will have a negative visual and noise impact on homes and Blue Park in Alexandria if the existing “greenbelt” of mature trees and shrubs along the railroad tracks are cut down. The Draft EIS maps show that some of this greenbelt is within the Project’s area of temporary and permanent impact. C2-64

HAZARDOUS MATERIALS

1. The DC2RVA will provide CSXT an upgraded rail system with the potential of moving more freight and toxic materials though the Project corridor. C2-65
    a. Do more trains mean more chances that a hazardous spill will happen?
    b. In the Bypass alignments, the Project will be introducing the potential for hazardous materials in previously pristine places. How is that accounted for?

INDIRECT AND CUMULATIVE EFFECTS

1. Concern about secondary/cumulative impacts in and around Fredericksburg C2-65
2. In the Richmond Area, the Draft EIS does not take into account the indirect/cumulative effects of the Project, including induced development. C2-66

SAFETY

1. Does adding a third rail increase the risk of train derailments? C2-66
2. Within Ashland, a third track would significantly endanger Randolph-Macon College’s students, faculty and staff, and tens of thousands of annual visitors. C2-66
3. Within Ashland, parked cars on Center Street/Railroad Avenue block visibility whether driving, walking, or biking. The difficult combination of street traffic, pedestrians, and trains from multiple directions is unsafe—how will the Project change these unsafe conditions? C2-67

OTHER

1. In Ashland, the analysis of the through town alternatives does not take into account the 100-year old trees and their history that would be destroyed. They date back to the Civil War. C2-67

2. What are the impacts to east coast commerce and international trade, if the DC2RVA corridor were incapacitated? There should be a north-south rail infrastructure back-up plan in a geographically separate location in case something occurred along the DC2RVA corridor, such as a natural or man-made emergency. ... C2-67

FUNDING, CONSTRUCTION, AND IMPLEMENTATION

1. Questions regarding Project funding, funding sources and timing, and/or funding for construction. ... C2-68
    a. Who is paying for this Project?
    b. DRPT claims that this Project will be paid for by "federal state and local sources" but have failed to advise the public that this "source" is our tax dollars.
2. How much will the new service fare cost? The cost of travel, not the number of trains, is the biggest obstacle to regularly using Amtrak. Will there be fare reductions compared to existing pricing? ... C2-68
3. Construction-related questions and/or issues ... C2-69
    a. How long would the Project take to construct?
    b. What does access to private property during construction look like?
    c. How will emergency access to properties occur during construction?
    d. What does construction phasing look like? Could the third rail alternatives be phased within Ashland that Center Street is not closed for the duration of the construction?
    e. There needs to be a robust process to ensure that new construction minimizes the impacts on adjacent neighborhoods and that there is a robust and transparent process for residents to monitor decisions and to be able to influence plans and actions.
4. After the Final EIS and ROD, what other tasks / deliverables are part of this Project? What is the "conceptual design" of this EIS versus "final design," and when would that occur? C2-70

APPENDIX C2

DETAILED RESPONSES TO GENERAL PUBLIC COMMENTS

Appendix C2

DETAILED RESPONSES TO GENERAL PUBLIC COMMENTS

STUDY PROCESS

Chapter 1 of this Final Environmental Impact Statement (EIS) provides a synopsis of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project background and study process, including decisions made during previous studies that affect the Project assumptions, the basis of the Project Purpose and Need, and a summary of the alternatives development process and Draft EIS documentation.

PURPOSE AND NEED

1. How is the purpose of this Project different than the previous 2002 Tier I document?

As described in Section 1.1.1 of the Final EIS, the DC2RVA Project is the second of a two-tiered environmental process. A first-level Tier I EIS and Record of Decision (ROD) was completed in 2002 for the 500-mile Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC (hereafter referred to as the 2002 Tier I EIS). The 2002 Tier I EIS, which was completed by the Federal Railroad Administration (FRA) in coordination with the Department of Rail and Public Transportation (DRPT), defined much of the framework upon which the DC2RVA Project is based, including: using existing fossil fuel locomotive technology; upgrading existing rail corridors; and building the corridor in incremental sections as funds become available. Refer to Section 1.2.1.1 of the Final EIS for additional details on 2002 Tier I EIS decisions. Additionally, Chapter 1 of the Draft EIS provides more information on the federal policy decisions governing the Project and the decision to improve conventional intercity passenger rail service.

The 2002 Tier I EIS established the overall purpose for the SEHSR corridor: to provide a competitive transportation choice to travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor. This DC2RVA Tier II EIS carries forward the purpose and need of the 2002 Tier I EIS within the specific Washington, D.C. to Richmond segment of the larger corridor—improving travel time, frequency, and reliability of conventional intercity passenger rail service along the existing railroad corridor between Washington, D.C. and Richmond, VA. The Tier II Purpose and Need further builds upon the Tier I by recognizing and incorporating several key corridor-specific items that are unique to the Project corridor, which are documented in Section 1.3.1 of the Final EIS. The corridor-specific items include establishment of a 90 mph maximum authorized speed for intercity passenger trains, accommodation of Virginia Railway Express (VRE) commuter trains, and accommodation of CSXT's freight service, plus the recognition that the corridor is owned and operated by CSXT.

2. Why is the Project adding more trains? Existing Amtrak trains do not appear to be full, and the corridor does not appear to be a major commuter route.

As described in Section 1.2 of the Final EIS, the need for additional intercity passenger trains in the corridor to meet the goals of the Project have been documented for many years. In line with response #1 above, the DC2RVA Project used three specific goals to guide the development of the proposed passenger rail service improvements:

- Increase the number of intercity passenger trains between Washington, D.C. and Richmond
- Increase the reliability of all intercity passenger trains between Washington, D.C. and Richmond, both existing and proposed trains
- Reduce travel times for all intercity passenger trains between Washington, D.C. and Richmond

In a properly functioning intercity passenger rail system, passenger cars are rarely "full" (i.e., filled to capacity), as a full train has no capacity to take on more passengers at the next stop or stops unless passengers exit the train. Ideally, there are always enough vacant seats available at each station stop to accommodate new passengers. If a train is already full when it leaves Richmond for Washington, D.C. (or vice versa), then passengers waiting at Ashland, Fredericksburg, Quantico, or other stations are unable to board. Furthermore, if the train continues full as it moves north to Philadelphia and New York or Boston, again, passengers are unable to board. The trains, now and in the future, are intended to have some empty seats.

DRPT conducted analysis as part of the Project that indicates that, if the Project is implemented, intercity passenger rail ridership will nearly double within the next 10 years, from 1.4 million annual passengers carried in 2015, to 2.5 million annual passengers carried in 2025, which is the proposed first year of the Project. These forecasts also indicate that intercity passenger rail ridership could triple between now and 2045, with a projected ridership in 2045 of 3.2 million annual passengers. Appendix J of the Draft EIS provides more information on passenger rail ridership projections in the corridor.

Intercity passenger trains, as defined in the Purpose and Need of the Project, are not limited to serving commuter passengers. Intercity passenger rail serves travelers making many kinds of trips, including business travel, recreational travel, visits to friends and family, vacation travel, and more. Intercity passenger trains traveling between Washington, D.C. and Richmond will continue north on Amtrak's Northeast Corridor (NEC) to Philadelphia, New York, and Boston, and south to Raleigh and Charlotte NC, as well as destinations in South Carolina, Georgia, and Florida, with stops in between.

While some passengers use Amtrak for commuting to/from work, many passengers continue traveling north beyond the Washington, D.C. metropolitan area or to points south of Richmond. VRE provides commuter service on a portion of the DC2RVA corridor by running commuter trains north into the city during the morning commute and south back to Spotsylvania during the afternoon commute. These trains do not continue north of Washington, D.C. or south of Spotsylvania, and do not provide intercity service.

3. **The 2002 Tier I EIS stated that this Project should minimize impacts by using existing rail corridors. Therefore, the bypass options under consideration as part of this Project do not conform to the Tier I recommendation.**

The Preferred Alternative for the corridor, as presented in Chapter 4 of the Final EIS, does not include any bypass alternatives that were evaluated in the Draft EIS.

As detailed within the Alternatives Technical Report (Appendix A of the Draft EIS), DRPT focused alternatives development within the existing CSXT right-of-way to minimize impacts and property acquisition. However, in areas where the right-of-way appeared potentially limited, or where other potentially reasonable alternatives were identified during Project scoping by stakeholders, DRPT evaluated a range of other alternatives, including new bypass alignments outside of existing CSXT right-of-way that would connect to existing rail lines. This approach is consistent with National Environmental Policy Act (NEPA) guidance, DC2RVA's Purpose and Need to increase capacity in the corridor, and recommendations of the 2002 Tier I EIS, which established the use of existing rail corridors in preference to new alignments, but did not preclude them if they provided the same benefits.

4. **The Project made a recommendation based on the assumption that Long Bridge and Union Station capacity improvements will be complete, when the timeline of neither is known.**

The DC2RVA Project is one part of a much larger intercity passenger rail series of interrelated projects to improve passenger rail service in the Southeast High Speed Rail Corridor and through its connections to the Northeast Corridor. The Project's service and benefits are clearly linked to and partially dependent upon completion of other projects both north and south of the DC2RVA corridor, as recognized in both the 2002 Tier I EIS and the Project's Purpose and Need (Chapter 1 of the Draft EIS and Section 1.3.1 of the Final EIS).

The relationship of the DC2RVA Project to the proposed improvements at the Long Bridge and Washington Union Station are presented in Draft EIS Section 1.6.4 and 1.6.5, respectively. Additionally, updated descriptions of the studies and projects in and adjacent to the corridor are presented in both Section 1.2 and Section 7.7 of the Final EIS. Refer to Section 1.2.4 of the Final EIS for details on how the Project relates to the 2017 Virginia Statewide Rail Plan, and Section 7.7 for current/ongoing Project coordination with other studies and projects, including their relevance to the Preferred Alternative specifically.

FRA and DRPT acknowledge that the recommended capacity improvements in the DC2RVA Project would provide incremental benefits to passenger service in the Project corridor and beyond, though the total benefits of the DC2RVA Project would not be available until other projects, including the Long Bridge Capacity Expansion and Washington Union Station capacity improvements, are complete. DRPT's assumptions regarding the completion of the Long Bridge and Union Station capacity improvements as part of the Project No Build Alternative are reasonable for the tiered planning process as described in 23 CFR 771.111(g) and Council on Environmental Quality (CEQ) regulations 40 CFR 1502.20 and 1508.28.

5. **Concerns over area-specific capacity needs**
    a. **Why is more rail capacity needed in Area 5 (Ashland) but not Area 2 (Northern Virginia)?**
    b. **Additional rail capacity through Area 5 (Ashland) is not needed and not appropriate.**
    c. **In all Build Alternatives, Ashland will become a choke point for rail traffic for the entire corridor and Project capacity goals will not be met.**

In response to a) and b), in order to improve passenger rail service frequency, reliability, and travel time in the Project corridor, which is shared by growing volumes of intercity passenger, commuter, and freight rail traffic, additional rail capacity is needed throughout the 123-mile corridor. This has been the conclusion of prior corridor studies, including the 2002 Tier I EIS (see Chapter 4 of Appendix A of the Draft EIS), and was verified by rail operations modeling conducted throughout this Tier II Project to define the specific rail infrastructure required to meet the Purpose and Need of the DC2RVA Project (see Section 3.2 of the Final EIS for details).

The Preferred Alternative for the DC2RVA corridor, as presented in detail for each area within Chapter 4 of the Final EIS, includes corridor-wide rail capacity improvements, most notably an additional main line track along most of the corridor, including both Area 2 and Area 5. Other capacity improvements to rail infrastructure, such as additional rail sidings, crossovers, and rail yard bypasses and leads, are included as part of the Preferred Alternative.

The Preferred Alternative in Area 2 (Alternative 2A) adds capacity to the corridor to ensure that a minimum of three main line tracks are available through this section of the corridor; refer to Section 4.3.2 of the Final EIS for detailed description of the Preferred Alternative within Area 2. The Preferred Alternative in Area 5 (Alternative 5A, commonly known as the “3-2-3” option) adds an additional track north and south of Ashland, as detailed in Section 4.3.5 of the Final EIS.

In response to c), subsequent to the publication of the Draft EIS, DRPT conducted additional refined rail operations analyses to estimate the sufficiency of the rail infrastructure presented in the Draft EIS, both within the DC2RVA corridor as well as in a larger network beyond the limits of the Project. These refined operations analyses are summarized in Section 3.2 of the Final EIS and detailed in its Appendix F and build on the preliminary operations simulation modeling conducted during preparation of the Draft EIS. Based on the refined operations analysis, DRPT and FRA determined that Preferred Alternative, including two tracks through Ashland (Alternative 5A, also known as “3-2-3”) and with 9 new daily intercity passenger round trips (18 total trains per day), meets the Purpose and Need of the Project while not unduly impacting CSXT’s forecasted future freight operations and minimizing environmental impacts through the Town of Ashland.

6. **CSXT does not support Build Alternative 5A (commonly known as the “3-2-3” option) due to capacity constraints. Why is it considered? Isn’t their support required to meet the Purpose and Need of the Project?**

FRA and DRPT are committed to continue working with CSXT to improve intercity passenger rail service in the DC2RVA corridor and have a long and successful history of cooperating with CSXT to improve passenger, commuter, and freight rail service in the Commonwealth. FRA and DRPT also recognize that CSXT owns and operates the DC2RVA rail corridor and has a responsibility to its shareholders and customers to provide efficient freight rail service. CSXT served on the Ashland/Hanover Area Community Advisory Committee (CAC) with other stakeholders, and contributed to the CAC's review of alternatives, at a level commensurate with other stakeholders. The CAC's recommendations were instrumental in the selection of Alternative 5A: Two Tracks Through Town as the Preferred Alternative for Area 5.

In addition, DRPT and FRA conducted independent computer-based rail operations analyses, which estimated passenger and freight train performance in the corridor under several infrastructure alternatives in Area 5. This effort provided additional information that aided FRA and DRPT in the selection of Alternative 5A as the Preferred Alternative for Area 5. This refined operations analysis determined that while constructing a two-track western bypass or adding a third track to the existing CSXT railroad through the Town of Ashland would improve the efficiency of railroad operations through DC2RVA study Area 5, the additional capacity was not required to meet the Purpose and Need of the DC2RVA Project. Additionally, since Alternative 5A (Maintain Two Tracks through Town) provided adequate railroad capacity to meet the Purpose and Need of the Project, this alternative also resulted in the least impacts to environmental resources, including historic properties. Should an alternative that avoids impacts to historic properties be feasible and prudent and meet the purpose and need of a project, then Section 4(f) of the U.S. DOT Act of 1966 requires FRA to select that alternative.

FRA and DRPT will continue to coordinate with CSXT and other Project stakeholders on service planning and engineering for the Preferred Alternative, including Project implementation and phasing of service.

7. **The Purpose and Need is based on an analysis of the "current" Need for the Project. However, the Draft EIS stated that the Project would be constructed between 15 and 25 years from now and the projections of the demand for enhanced passenger rail and freight service are presented for between 2025 and 2045—neither of which are "current."**

Section 1.5 of the Draft EIS stated that "current conditions" in the Project corridor support the Purpose and Need set forth in the 2002 Tier I EIS. These conditions were listed as: population growth; freight growth; congestion in the I-95 corridor; air travel congestion; rail capacity issues in the corridor; reliable and convenient movement of goods and people; and air quality. The listed conditions are applicable to support the Project Purpose and Need throughout the Tier II planning dates that were established by FRA and DRPT and are presented in Section 1.2.6 of the Final EIS. As described in that section, federal guidance requires that DRPT demonstrate that the Project is sufficient to deliver the proposed passenger rail benefits and an efficient and reliable multimodal rail corridor over a 20-year time horizon following the anticipated completion of the construction (i.e., 20 years past 2025 for the DC2RVA Project). Accordingly, DRPT used operational simulations analysis, as summarized in Section 3.2 of the Final EIS, to test the proposed alternatives to determine if the rail capacity is adequate for both the opening day (2025) levels of projected passenger, commuter, and freight rail traffic and to determine if the infrastructure remains adequate over the 20-year planning horizon of 2045.

8. **The DC2RVA proposed solutions do not demonstrate that the rail options will truly support the service growth and results required to meet the Project Purpose and Need.**
    a. **Why is a proposed third track needed?**
    b. **Are even more tracks needed?**
    c. **Would it be worth it from a cost-benefit perspective to add more lines as part of this Project, to plan for the future?**

In response to a), the Project capacity improvements recommended by DRPT in the Draft EIS, and the associated Preferred Alternative presented in Chapter 4 of the Final EIS, provide the additional infrastructure necessary to meet the Project's Purpose and Need. This includes additional capacity to support the addition of 9 new daily intercity passenger round trips (18 total trains per day) in the corridor, as well as VRE's planned near-term commuter service growth and CSXT's estimated freight service growth through the year 2045. The additional rail capacity is expanded by adding a third rail to the majority of the Project corridor, and a fourth track in some areas in Northern Virginia where a third track already exists. Chapter 4 of the Final EIS includes an explanation of DRPT’s basis for recommending the Preferred Alternative within each area.

DRPT's operational analyses as described in the Draft EIS (Section 2.6 and Appendix I in the Draft EIS) show that for most of the corridor, adding one main track to the existing CSXT corridor provides sufficient additional capacity to meet the Project's Purpose and Need. Subsequent to the publication of the Draft EIS, DRPT conducted additional refined rail operations analyses to assess the sufficiency of the rail infrastructure presented in the Draft EIS, both within the DC2RVA corridor as well as in a larger CSXT network. These refined rail operations analyses are presented in Section 3.2 and Appendix F of the Final EIS, and they show that the Preferred Alternative meets the performance goals of the Project, and Project Purpose and Need, for the entire corridor.

In response to b) and c), any additional improvements beyond those identified as part of the Preferred Alternative do not justify the additional cost or environmental impact as they are not necessary to meet the Project Purpose and Need.

9. **There is no point to this Project without a national plan for better passenger rail.**

The DC2RVA corridor is a critical link between Amtrak’s heavily traveled NEC and the developing SEHSR corridor extending south of Richmond. The DC2RVA Project is one part of a larger series of rail improvement projects throughout the state, region, and eastern portion of the U.S. that have been ongoing since the early 1990s. Section 1.2 of the Final EIS describes in detail how the SESHR corridor and its studies have evolved to reflect additional studies and planning, national and state transportation priorities and funding, and demand for intercity passenger rail services, and how these key documents relate to the Purpose and Need of the DC2RVA Project.

The ability of the DC2RVA Project to improve intercity passenger rail service is dependent upon the performance and capacity of the connecting NEC and SEHSR corridor and completion of the related projects and their associated rail improvements. A summary of some of the key interrelated rail improvement projects and studies is presented in Section 7.7 of the Final EIS.

10. **High speed rail won't meaningfully reduce vehicle traffic, which is stated as an element of the Purpose and Need. The touted reduction in I-95 congestion by adding a high speed rail in the Project documentation is not true.**

The DC2RVA Project Purpose and Need (Chapter 1 of the Draft EIS and summarized in Section 1.3 of the Final EIS) states the Project is needed to address existing congestion on the rail network, not I-95. The DC2RVA Project will offer travelers a viable alternative to the congested interstate and, by diverting some travelers from road to rail, congestion will be less than without the Project. Section 5.15.1 of the Final EIS estimates the decreases in vehicles using the regional roadway network (i.e., mainly I-95) between Washington, D.C. and Richmond, VA.

PROPOSED TRAIN SERVICE / OPERATIONS / SCHEDULE

1. **The lack of specific travel time saved associated with each Build Alternative in the Draft EIS suggests the Project will provide negligible benefits for unacceptable costs.**

To aid in preliminary ridership forecasting, DRPT developed conceptual timetables incorporating the train frequency and train speed for each of the Richmond Area Build Alternatives described in Chapter 2 of the Draft EIS. Table 2.6-2 in that same chapter summarizes the estimated travel times, inclusive of station stops, between Washington, D.C. and Richmond based on the conceptual timetables for each Build Alternative. However, the travel times would vary for each train depending on time of day and schedule, and the number of stops. Subsequent to the publication of the Draft EIS, DRPT worked with FRA and Amtrak to refine the proposed passenger train schedules; refer to Appendix F of the Final EIS.

The proposed reduction in travel time is only one of the three major transportation benefits that the DC2RVA Project would create. In addition to reducing travel time, the Project will improve the reliability of both existing and proposed passenger trains traveling between Washington, D.C. and Richmond. Finally, the Project will allow for the introduction of 9 new daily intercity passenger round trips (18 total trains per day) between Washington, D.C. and Richmond—essentially doubling the number of train departures each way for passengers traveling in the DC2RVA corridor. The significant increase in train frequency will provide more convenient travel times for multiple types of travelers and markets. It is the combination of more frequent departures, improved reliability, and the reduction in trip time that will fulfill the Project Purpose and Need to make rail a more competitive choice.

2. **Amtrak service is not a reliable transportation choice. Amtrak doesn't need to be faster, just more reliable. What is this Project doing to improve the frequent delays and/or cancellations that currently occur on Amtrak?**

Achieving better passenger train on-time performance (i.e., reliability) is a cornerstone of the rail infrastructure improvements that are proposed by the DC2RVA Project. The 2002 Tier I EIS concluded that in the DC2RVA corridor, opportunities for increased speeds are limited, and therefore recommended incremental improvements for network fluidity within the existing right-of-way. DRPT's goal is to enable intercity passenger trains to achieve an on-time performance of 90 percent or better between Washington, D.C. and Richmond (Amtrak current performance is approximately 65 percent on-time performance in the corridor). The increase in on-time performance would be achieved in large part due to the additional capacity from adding a third track (and fourth track in some areas in Northern Virginia where a third track already exists) along most of the corridor, as proposed by the Project. Proposed infrastructure improvements of the Preferred Alternative will allow for intercity passenger rail speeds to increase from the current maximum authorized speed of 70 mph for the corridor (except for Richmond to Centralia, which is currently authorized at 79 mph) to a maximum authorized speed of 90 mph, where practical. It is important to note that the passenger trains in the DC2RVA Project have endpoints beyond the Project area (New York and Boston to the north, and Hampton Roads, North Carolina, Georgia, and Florida to the south); however, projects and plans are underway in connecting corridors to address delays in those locations, as described in Section 1.2.1.3 of the Final EIS.

3. **The passenger trains proposed by the Project should go faster. This is not true high speed rail that other countries have.**

As described in Chapter 1 of the Final EIS and in line with the 2002 Tier I EIS decisions that were made, the Purpose of the DC2RVA Project is to improve the travel time, frequency, and reliability of intercity passenger rail service between Washington, D.C. and Richmond on existing railroad lines using conventional diesel-powered locomotive technology. The 2002 Tier I EIS did evaluate and dismiss “advanced” high speed rail (i.e., trains with average operating speeds of 185 to 200 mph) because it would require the construction of an entirely new and separate passenger-only railroad system, which FRA and DRPT determined at that time was not necessary to meet the need of the SEHSR corridor to connect major urban centers. Additionally, passenger service (intercity and commuter) and freight service share the CSXT-owned tracks, now as well as in the Preferred Alternative proposed by this Project. The previous 2002 Tier I EIS assumed a maximum speed of 110 mph for intercity passenger trains, with an average speed of approximately 70 mph along the full length of the SEHSR corridor between Washington, D.C. and Charlotte, NC. Subsequently, in 2009, FRA released its strategic plan for higher speed rail in America; investment strategies included upgrading reliability and service on conventional intercity rail services (operating speeds up to 79 to 90 mph on shared track) and developing emerging and regional higher-speed corridor services (operating speeds up to 90 to 110 mph on shared track). Also in September 2009, DRPT released its I-95 Southeast High Speed Rail Corridor & Service Plan, which set a goal of increasing passenger rail speed to a 90 mph maximum in the Washington, D.C. to Petersburg, VA corridor. In keeping with DRPT’s 2009 Service Plan, the DC2RVA Project was designed to upgrade the reliability and service of conventional intercity rail services at speeds up to 90 mph, where practical, in a corridor shared with commuter and freight services. Additional details on these previous studies are provided in Section 1.2 of the Final EIS.

DRPT determined that a maximum speed for intercity passenger rail of 90 mph, where feasible, for the DCRVA Project provided the optimal capacity to improve service on the DC2RVA corridor while minimizing environmental impacts and costs. However, DRPT’s determination that a maximum speed of 90 mph for the passenger trains in the DC2RVA corridor does not preclude consideration in the future to increase the maximum allowable speed in the corridor, nor does it preclude pursuing European- or Asian-style 180-mph+ high speed rail projects at some point in the future, separate from this Project. Specifically, one of the guiding principles of the DC2RVA Basis of Design was to not preclude future electrification of the corridor, which would be subject to separate environmental documentation at that time.

4. **Concerns about rail technology assumed and/or evaluated in the Draft EIS**
    a. **The Project does not use the most up-to-date technology, such as hyperloop.**
    b. **This type of rail is an antiquated system and is not the future of transportation.**
    c. **No consideration is given to the fact that rail technology is changing (as reported in Draft EIS Appendix I); this assumption should be added to the report and then defended. The contents of Draft EIS Appendix J lists five types of transportation, but fails to identify new or emerging technologies.**

In response to a), b), and c), FRA, DRPT, and their partners are focused on improving rail service and reliability through conventional intercity passenger rail service operating at higher speeds through this Project. As discussed in Section 1.2 of the Final EIS, the DC2RVA Project is a Tier II EIS that builds on the decisions made as part of the 2002 Tier I EIS and ROD, in which FRA and the Federal Highway Administration (FHWA) selected an incremental approach to developing the passenger rail that maximizes use of existing infrastructure and minimizes environmental impacts. In the 2002 Tier I EIS, FRA and FHWA determined this approach to be the most cost-effective. Key elements of this incremental approach include: upgrading existing rail corridors (instead of developing new rail corridors); using fossil-fuel burning equipment rather than electric-powered equipment; and adding service as market demand increases and/or when funding is available.

The 2002 Tier I EIS did consider other types of technology, such as electrification systems, but FRA and FHWA did not recommend these due to high capital cost of implementation relative to the level of ridership demand for that type of service in the SEHSR corridor. The 2002 Tier I EIS also evaluated and dismissed advanced high speed rail (i.e., trains with average operating speeds of 185 to 200 mph) because it would require the construction of an entirely new and separate passenger-only railroad system, which was not necessary to meet the need of the Project to connect major urban centers. The 2002 Tier I EIS recognized that ridership demand will continue to increase across the SEHSR corridor, and stated that electrification or higher speed operation could be developed in the future. Accordingly, one of the guiding principles of the DC2RVA Project's Basis of Design (Appendix B of the Draft EIS) was to not preclude future electrification of the corridor, such as providing sufficient clearance on new grade-separated roadway crossings to accommodate a potential future electric catenary system.

DRPT does recognize that technologies are changing, and new transportation modes and options may be available in the future. Advancing the DC2RVA Project with an incremental approach does not preclude future applications of hyperloop or other new technologies if or when they become viable, which would be subject to separate environmental documentation at that time.

5. **Concerns about operations of new service proposed by the Project**
   a. **When will the proposed trains run?**
   b. **Why is there no late train?**
   c. **Are trips seven days a week?**
   d. **Are trips only for commuters?**
   e. **Monday through Friday service is insufficient, and weekends are needed too.**

In response to a) through e), the proposed intercity passenger rail service expansion between Washington, D.C. and Richmond is planned to run seven days per week, just like the existing intercity passenger rail service between Washington, D.C. and Richmond. The Project proposes to add 9 new daily intercity passenger round trips (18 total trains per day) between Washington, D.C. and Richmond—essentially doubling the number of train departures each way for passengers traveling in the DC2RVA corridor. Intercity passenger trains are not limited to serving commuter passengers and are intended to cater to travelers making many different kinds of trips, including business travel, recreational travel, visits to friends and family, vacation travel, and more. To serve this diverse group of travel needs, DRPT prepared a service plan for the DC2RVA Project that proposes to operate passenger trains between Washington, D.C. and Richmond every 1 to 2 hours during the day and early evening. A conceptual train schedule was included in Draft EIS Appendix J. Additionally, as part of the Project, DRPT is developing a Corridor Service Development Plan that will provide additional detail on the service implementation, ridership, and operations; refer to Section 7.3 of the Final EIS for more details.

Under the proposed schedule, for both southbound trips from Washington Union Station and northbound trips from Richmond, the earliest departure of the day would occur around 6 a.m. and the last departure of the day would occur around 9 p.m. The 9 new daily intercity passenger round trips (18 total trains per day) proposed by this Project will be incorporated into Amtrak's existing passenger rail network, as described in Section 4.2 of the Final EIS.

6. **Concerns about freight service**
   a. **Project forecasts of future freight should be viewed with skepticism.**
   b. **The Project fails to anticipate major shifts in distribution patterns for freight that will be implemented over the next 20 to 40 years.**
   c. **The growth in the freight capacity is an assumption that may not hold up. Data published by the Association of American Railroads shows that the number of carloads in the year 2017 to date is below the number for the years 2015 and 2016.**
   d. **Higher speeds are needed by freight trains.**
   e. **Amtrak may use the rail corridor, but over 90% of rail traffic will be CSXT freight trains.**

Details of the rail operations analysis modeling for all Build Alternatives were provided in Appendix I of the Draft EIS; refined operations analysis modeling that was updated for the Preferred Alternative is provided in Section 3.2 and Appendix F of the Final EIS.

In response to a), as part of the planning work to accommodate the forecasted growth of freight service and in accordance with federal requirements, DRPT solicited input from CSXT about future increases in freight rail traffic in the corridor through the year 2045, which is the 20-year horizon beyond the Project's proposed implementation year of 2025. CSXT provided baseline data and suggested that DRPT use the U.S. Department of Transportation's (USDOT) Freight Analysis Framework (FAF) to forecast how rail freight traffic in the DC2RVA corridor would increase and change through the year 2045. The FAF is produced through a partnership between the Federal Bureau of Transportation Statistics and FHWA; it integrates data from a variety of sources to create a comprehensive picture of freight movement among states and major metropolitan areas by all modes of transportation. The FAF provides publicly available projected growth rates for rail freight traffic. The FAF also provides growth rates that are differentiated by commodity type, and in addition provides forecasts for tonnage and value by regions of origin and destination.

To determine the growth rate of freight within the DC2RVA corridor, DRPT applied the growth rates in ton-miles by commodity group for the states that CSXT operates in to determine growth by train type in the corridor (i.e., intermodal, manifest, bulk, automotive). FAF data reports ton-miles by commodity group, from which DRPT was able to assign to different train types associated with that commodity based on a methodology used by the Association of American Railroads in its National Freight Infrastructure Capacity and Investment Study (AAR, 2007). The forecasted growth in ton-miles was applied to existing freight trains first until they reached a predetermined number of freight cars, after which the remaining growth was applied to additional trains with the same number of cars.

In response to b) and c), the DC2RVA Project is designed to accommodate the projected growth of freight service through the planning year of 2045, at freight growth rates established by USDOT's FAF, and accepted by the FRA and DRPT as documented in the Draft EIS. The infrastructure proposed as part of the DC2RVA Project meets the stated Purpose and Need; refer to Section 3.2 of the Final EIS for further details on refined operations modeling that indicated such. As described in the response a) above, as part of the planning work to accommodate the forecasted growth of freight service, DRPT solicited input from CSXT regarding their future increases in freight rail traffic in the corridor through the year 2045. This forecast is to ensure the Project meets meet federal requirements that rail projects must determine and accommodate future rail volumes and capacity needs for a period of 20 year beyond implementation date. DRPT used the USDOT's FAF to forecast how rail freight traffic in the corridor would increase and change through the year 2045. For more information on how planned increases in freight rail traffic were accounted for, refer to Appendix I of the Draft EIS.

In response to d), it is a Project Purpose to provide for the efficient movement of rail freight traffic in the DC2RVA corridor (refer to Section 1.3 of the Final EIS for additional detail). By adding an additional rail to the majority of the Project corridor, the Project will not only allow 9 new daily intercity passenger round trips (18 total trains per day) to run each day, at 90 percent on-time performance, but also allow for enough track capacity to accommodate anticipated freight train growth.

In certain segments of the corridor, the new and upgraded infrastructure proposed by the Project could also allow for a potential increase in freight train speeds. The most significant increase in freight train speeds could occur in the segment between Richmond Main Street Station and Centralia, where the Project proposes to rebuild a 25 mph freight line to current track standards that could accommodate passenger trains with a maximum authorized speed of 79 mph and freight trains with a maximum authorized speed of 60 mph. Throughout the corridor north of

Richmond, a number of curves will be rebuilt, which could result in potential freight train speed increases of 5 mph to 20 mph around those curves.

In response to e), in addition to what was stated in response to a) and b) above, the Project accounts for projected increases in all train types. In the DC2RVA corridor, the mix of freight, intercity passenger, and commuter rail traffic varies by segment of the corridor, with locations closer to Washington, D.C. having more passenger and commuter traffic, particularly north of Fredericksburg and Alexandria, regardless of whether the Project is implemented. Table 2.5-2 of the Draft EIS presented the total number of each type of train for existing and future conditions. In 2015, freight train traffic accounted for less than half of all train traffic in the overall corridor. The No Build scenario for 2045 indicates that freight traffic north of Alexandria is projected to account for 38 percent to 45 percent of all train traffic in the corridor—again less than half—and north of Fredericksburg, freight train traffic is projected to account for 51 percent to 59 percent of all train traffic. In the 2045 Build scenario, with the Project's proposed addition of 9 new daily intercity passenger round trips (18 total trains per day), freight traffic would again be less than half of all train traffic on the corridor; freight volume north of Alexandria would be only 32 percent to 40 percent of all traffic, and north of Fredericksburg would be 42 percent to 50 percent of all traffic. For additional information about the projected mix of freight, passenger, and commuter traffic on the DC2RVA corridor see both Chapter 2 and Appendix I of the Draft EIS. It is important to note that VRE and CSXT growth is independent of the DC2RVA Project and will occur regardless of whether or not the DC2RVA Project is implemented.

7. **Concerns about Virginia Railway Express (VRE) service**
    a. **Are VRE changes part of the Project?**
    b. **Can night and/or weekend trains to VRE be added as part of this Project?**
    c. **A better alternative would be to expand commuter service between Fredericksburg and Richmond by the VRE or use Mobile Diesel Units to provide service connecting with VRE.**

The DC2RVA Project proposes to expand intercity passenger rail service between Washington, D.C. and Richmond, VA as part of the development of the federally funded SEHSR corridor, as summarized in Section 4.2 of the Final EIS. Under the Project service plan, intercity passenger trains will operate through the DC2RVA corridor but originate from, or continue to, destinations north of Washington, D.C. on the Northeast Corridor, or south of Richmond in North Carolina or Hampton Roads (though one daily round trip is planned to originate in Richmond and operate north of Washington, D.C. to and from Boston.) Under the proposed service plan, intercity passenger trains will operate between Washington, D.C. and Richmond every 1 to 2 hours in each direction during the day and early evening.

In response to a) and b), the DC2RVA Project does not include changes to VRE service directly but will allow for the planned near-term expansion of VRE commuter rail service. The proposed intercity passenger rail service expansion for the Project is anticipated to run seven days per week, consistent with existing passenger rail service, with departures throughout the day. As shown in Figure 4.2-1 of the Final EIS, some of those intercity passenger trains may make station stops at stations also served by VRE commuter trains, including Fredericksburg, Quantico, Woodbridge, Alexandria, L'Enfant Plaza (limited service), and Washington Union Station.

The intercity passenger service will be operated separately from and independently of VRE commuter rail service. VRE has developed its own 2040 Plan, which includes a long-term goal of creating the opportunity for weekend service. Station improvements as part of the Project, as described in Chapter 4 of the Final EIS, apply to intercity passenger rail stations providing service to Amtrak, and include stations shared by Amtrak and VRE. Adjustments to VRE stations are being coordinated between VRE and DRPT, separate from the DC2RVA Project, but any additional track or track realignments constructed under the DC2RVA Project will support the planned platform improvements at stations served by VRE.

In response to c), options to expand VRE commuter rail service from Fredericksburg to Richmond or use self-propelled Diesel Multiple Unit railcars to provide connecting services were not evaluated because they do not meet the Purpose and Need of the DC2RVA Project.

8. **Reliable travel times and schedules are an unachievable goal even if all of the recommendations of the Draft EIS were adopted because many of the trains originate outside of the corridor. The Draft EIS fails to acknowledge barriers to faster or more reliable travel times that are outside of the area of proposed DC2RVA capacity improvements, such as at Long Bridge across the Potomac River or at Washington's Union Station. The improvements will not make corridor trains a competitive alternative to automobiles and are not worth the costs to affected stakeholders.**

See the response to Study Process #4 in the section above. FRA and DRPT recognize that the DC2RVA Project is just one of a series of projects which must be completed to achieve the Purpose and Need of the 2002 Tier I EIS and ROD for the entire SEHSR corridor, and to achieve the benefits of other rail improvement projects in the NEC and beyond. In order to obtain the full benefit of the DC2RVA infrastructure and service improvements, several other ongoing rail improvement projects must also be completed in corridors adjacent to the DC2RVA corridor. The DC2RVA Project provides a critical link between Amtrak's heavily traveled NEC and the developing SEHSR corridor. The ability of the DC2RVA Project to improve intercity passenger rail is dependent upon the performance and capacity of these connecting corridors and completion of the related projects and their associated rail improvements.

Details of the previous and ongoing rail planning studies in the DC2RVA corridor and adjacent sections of the larger Southeast and Northeast Rail Corridors were provided in Chapter 4 of the Alternatives Technical Report (Appendix A of the Draft EIS). Section 1.2 of the Final EIS describes how the Project is one part of a larger series of rail improvement projects through the state, region, and eastern portion of the U.S. is provided in. Additionally, a summary of some of the key interrelated rail improvement projects and studies, and the relationship of these other studies/projects to the DC2RVA Project, is presented in Section 7.7 of the Final EIS.

In keeping with the decisions in the 2002 Tier I EIS and ROD, improvements in the entire SEHSR corridor are being conducted in an incremental approach. The DC2RVA Project upgrades the reliability and service of existing and planned conventional intercity rail services to operate at higher speeds up to 90 mph, where practical, in a 123-mile multimodal corridor shared with commuter and freight services.

9. **Concerns about the design of track crossovers**
   a. **Did the Project consider upgrading all rail line crossovers to be at least 45 mph?**
   b. **The current crossovers at Doswell and Milford are only 30 mph and the resulting approaching signals slow trains down farther out than is necessary, both of which results in operations delays in the corridor.**

In response to a), per the Project Basis of Design, all proposed crossovers in the Project corridor are being designed to the maximum speed allowable by CSXT. The Project upgrades all new crossovers where track is impacted by the Preferred Alternative to include the highest-speed turnout (one end of a crossover) allowed by CSXT on its mainlines, which is 45 mph. The existing railroad infrastructure, including crossovers, will remain in place except where the DC2RVA Project directly impacts that infrastructure.

In response to b), the DC2RVA Project includes a higher speed crossover at Doswell and a second higher speed crossover at North Doswell. An existing crossover at Milford will remain in place with three proposed higher speed crossovers to be added to create a full universal interlocking at Milford.

PUBLIC INVOLVEMENT

1. **How are our voices being heard?**
   a. **Are email and written comments being processed the same way?**
   b. **Mass comments dilute the messages of local residents.**
   c. **The comment-response is an unethical process— "form" comments sent through auto-generated websites should be eliminated/should not be "counted" as equivalent to citizen comments.**
   d. **Will all repeat comments by a single person be counted as individual comments in the record?**
   e. **What is considered more helpful by the DRPT—the total number of comments for or against an option or the quality of the comments?**

In response to a), Section 2.1 of the Final EIS describes the public involvement for the entire Project process, including public comments received on the Draft EIS. During the DC2RVA Project process, there were three formal comment periods to coincide with major Project milestones: Scoping, Alternatives Development, and Draft EIS.

During these formal comment periods, DRPT collected public and agency comments from a variety of sources including oral comments during public meetings and hearings, hotline calls, mailed letters, emails, petitions, and web comments. Each comment was reviewed to determine the issues and concerns identified. The same review process was applied for all comments, regardless of the method of receipt: each comment was documented and processed through DRPT's comment database to categorize issues and concerns about the Project.

In response to b), c), d), and e), the introduction to this Appendix C details the process for responding to public comments. During the Draft EIS comment period, DRPT received thousands of comments, and many of the comments addressed similar issues. The goal of the public comment process is to understand the public's view of the Project and its alternatives in order to provide input into the decision-making process of the section of the Preferred Alternative.

DRPT considered all public comments on the Draft EIS and addressed substantive concerns in the Final EIS by way of this Appendix C. DRPT and FRA do not view the public comment process as a "vote counting" process but rather one seeking substantive comments that benefit the FRA and DRPT in their final decision-making process. The public comment process is also an opportunity for the public to inform FRA or DRPT of potential concerns or conditions that were not identified during the preparation of the Draft EIS.

2. **Concerns about public outreach and involvement in Area 5 (Ashland)**
    a. **Within Ashland, the communication and transparency with the public was lacking.**
    b. **Homeowners along the proposed bypass should have been included/notified earlier.**
    c. **Ashland is getting a disproportionate amount of time/effort. It is one small town in a 123-mile corridor that will benefit from this Project.**
    d. **Why did Ashland have to do something other communities have not completed (i.e., the CAC, subsequent to publication of the Draft EIS)?**

In response to a), DRPT implemented an active and robust outreach effort beginning in 2014 to engage the public and have meaningful exchanges with corridor communities regarding the Project. Through the alternatives development process and related public outreach, DRPT recognized the unique nature of the Town of Ashland and Hanover County, and that many of the alternatives for improved rail capacity in this area generated community concerns.

As part of their fulfillment of the NEPA requirements, DRPT conducted extensive public outreach along the corridor to identify potential alternatives and public concerns, present the results of DRPT's preliminary alternative screening and evaluations, and evaluate Project impacts. Project alternatives, mapping, and other information, including copies of all meeting presentations, are available on the Project website. In the Town of Ashland/Hanover County area meetings, DRPT provided Project materials presenting multiple alternatives including four western bypass alignments and five eastern bypass alignments, and identified one western bypass for detailed evaluation in the Draft EIS. The Draft EIS describes the alternatives development process, and for Area 5 (Ashland), evaluates in detail seven alternatives. See responses to b), c), and d) below for further details on communication and coordination.

In response to b), in order to solicit input from property owners near potential alternatives throughout the Project corridor, DRPT mailed letters to over 10,000 property owners asking for their input and urging them to visit the property owner page on the Project website. DRPT used locality data to obtain addresses and alerted local officials in advance of property owner letter mailings. DRPT also visited dozens of civic groups, task forces, and governmental organizations to inform them of Project status and to gather input.

In response to c), throughout most of the 123-mile Project corridor, DRPT was able to identify reasonable alternatives that largely fit within existing railroad right-of-way, thereby minimizing impacts to property, communities, and environmental resources. However, the railroad right-of-way in Ashland presents a unique set of circumstances within the Project corridor: the characteristics of a railroad mainline located at-grade in the center of a limited-width street for almost two miles through a historic town. Developing and evaluating alternatives that meet the DC2RVA Purpose and Need while seeking to minimize impacts to property, community and environmental resources in the Ashland area was more challenging than in other parts of the Project corridor in regard to public outreach.

In response to d), during preparation of the Draft EIS, DRPT recognized that each of the proposed Build Alternatives for Alternative Area 5 would have potentially adverse consequences on the citizens and resources of the Town of Ashland and/or Hanover County, and there was no local consensus or preference for a build alternative. In addition, both the Town of Ashland and Hanover County expressed the desire to have the opportunity to be more engaged in the development and evaluation of local options. DRPT therefore determined that expanded community involvement would better inform DRPT's and FRA's decision-making process, and reached out to the Town of Ashland, Hanover County, Randolph-Macon College, Richmond Metropolitan Planning Organization, and CSXT to participate in the Town of Ashland/Hanover County Community Advisory Committee (CAC) to take a fresh look at a wide range of alternatives for the Project through Alternative Area 5. CAC members were appointed by their communities/organizations, and all CAC meetings were open to the public. Refer to Section 2.14.3 of the Final EIS for further description of the CAC, and Appendix G of the Final EIS for a summary of CAC activities.

3. **What was the outcome of the Ashland CAC after the publication of the Draft EIS?**
    a. **How does it affect analyses that occurred within the Draft EIS or in the Final EIS?**
    b. **There needs to be a formal comment period on any recommendations in Area 5 prior to the next step in the process.**

Section 2.1.4.3 of the Final EIS describes the CAC and Appendix G of the Final EIS provides a full summary of CAC activities.

In response to a), as described in the above locations in the Final EIS, Alternative 5A: Two Tracks Through Town (also known as "3-2-3" option) was selected by the Ashland/Hanover CAC as one of their three "least objectionable" options (it was the least objectionable "through town") alternative. As described in Chapter 4 of the Final EIS, Alternative 5A was selected as the Preferred Alternative for the Project, based on the findings of the Draft EIS, input from the CAC as well as public and agency comments, and the results of refined rail corridor operations simulation modeling that showed Alternative 5A could meet the Project Purpose and Need. This refined operations analysis determined that while constructing a two-track western bypass or adding a third track to the existing CSXT railroad through the Town of Ashland would improve the efficiency of railroad operations through DC2RVA study Area 5, the additional capacity was not required to meet the Purpose and Need of the DC2RVA Project. Additionally, since Alternative 5A (Maintain Two Tracks through Town) provided adequate railroad capacity to meet the Purpose and Need of the Project, this alternative also resulted in the least impacts to historic properties. Should an alternative that avoids impacts to historic properties be feasible and prudent and meet the purpose and need of a project, then Section 4(f) of the U.S. DOT Act of 1966 requires FRA to select that alternative (see Chapter 6 of the Final EIS for the Final Section 4(f) Evaluation).

The recommendations of the CAC were a contributing factor to both the Commonwealth Transportation Board (CTB) resolution for the Project (Appendix H of the Final EIS), and the selection of the Preferred Alternative, as documented in Section 4.1 of the Final EIS. The CTB resolution also directed DRPT to explore the need for other safety improvements to pedestrian and vehicle at-grade crossings and to improve emergency vehicle access within the Town of Ashland, and to avoid or minimize any property acquisitions in downtown Ashland where the corridor would remain two tracks. Preferred Alternative 5A is fully described in Section 4.3.5 of the Final EIS, including rationale for the basis of selection and description of any design changes that have occurred since publication of the Draft EIS. In the Preferred Alternative 5A, a third main track will be added to the rail corridor from Doswell south to Ashland, and from Ashland south to I-295. Grade separations are proposed at Vaughan Road (Archie Cannon Drive) and Ashcake Road on the outskirts of Ashland. Between Vaughan Road (Archie Cannon Drive) and Ashcake Road, the rail corridor will remain two tracks through downtown Ashland and existing at-grade vehicle crossings, such as S.R. 54, will remain in operation. The Ashland station will remain in its present location, without any improvements as part of this Project. Environmental impacts for the Preferred Alternative are presented in Chapter 5 of the Final EIS.

In response to b), DRPT and FRA prepared the Draft and Final EIS in accordance with the NEPA and its implementing regulations, as described in FRA's Environmental Procedures and CEQ regulations 40 CFR 1500 -1508. These regulations require FRA and DRPT to consider the environmental impacts of proposed actions and reasonable alternatives to those actions, and to make information on the impacts and alternatives publicly available before decisions are made and actions occur. Acknowledging the unique nature of the area and community concerns, the CAC was established to further review and inform the evaluation of alternatives for Area 5. All meetings were open to the public, with specific meeting times set aside specifically to allow for verbal comment by the public. Each of the CAC meetings included a full video recording available after the meeting on the Project website. The video offered the public who were unable to attend the meetings an opportunity to view the same information when it was most convenient for them. All public comments and questions were reviewed by the DRPT staff, and responses were prepared and shared with the CAC as part of the decision-making process. The composition and role of the CAC are summarized in Section 2.1.4.3 of the Final EIS and a summary report of CAC activities is included as Appendix G of the Final EIS.

After reviewing all the comments received on the Draft EIS and considering the input from the CAC process and the public comments made during it, plus the results of additional operations simulation modeling, on December 6, 2017, DRPT provided the CTB with a final recommendation for Alternative 5A as the Preferred Alternative in Area 5.

4. DRPT has ignored public input for not expanding the CSXT rails.

The No Build Alternative (i.e., no expansion of rails within the CSXT corridor) was fully evaluated and dismissed by the FRA and FHWA in the 2002 Tier I EIS because it did not meet the Project's Purpose and Need. Although previously dismissed, the DC2RVA Project process fully considered the No Build Alternative in the Draft EIS as required by NEPA. However, as stated in Section 4.4.2 of the Final EIS, FRA and DRPT confirm the findings of the 2002 Tier I EIS that the No Build Alternative is not a viable alternative to meet the Project's Purpose and Need.

OTHER

1. Will this process happen again in 20 years because of infrastructure upgrade issues?

Infrastructure elements, as proposed under the Preferred Alternative, are intended to provide the desired capacity and safety improvements necessary to meet the Project's purpose and need (as stated in Chapter 1 of the Final EIS). Federal requirements under the Passenger Rail Investment and Improvement Act of 2008 (PRIIA) require that the proposed improvements satisfy the corridor needs through the 20-year operation horizon (estimated to be 2045). Prior to that time, it is expected that routine maintenance and/or upgrading of railroad infrastructure could be required, however such actions would not require additional NEPA evaluations or approvals.

In the event of major changes in rail technology in the future, FRA or the appropriate Federal sponsoring agency would make a determination of required approvals at the appropriate time. It cannot be speculated at this time what such requirements will be 20 years in the future.

2. Opposition to CSXT's level of involvement in the Project

a. CSXT is not funding its fair share of this Project.

b. CSXT attempt to "control" the decision of Ashland based on their own in-house study of Project impact on CSXT.

CSXT owns and operates the railroad upon which the DC2RVA Project is based and is therefore an important stakeholder in Project planning and evaluation.

In response to a), funding for the DC2RVA Tier II EIS was provided from an FRA grant for high performance intercity passenger rail development with the Commonwealth of Virginia and CSXT providing a required non-federal match to the FRA grant funds. DRPT has not secured funding for the full-build of the DC2RVA Project; refer to Section 7.4 of the Final EIS for details.

In response to b), CSXT served on the Town of Ashland/Hanover County CAC with other stakeholders, and contributed to the CAC's review of alternatives, at a level commensurate with other stakeholders. The role of the CAC and that of other Project stakeholders was to provide comments and input to DRPT and the CTB as they formulated a recommended Preferred Alternative. The CAC's recommendations were instrumental in the selection of Alternative 5A – Two Tracks Through Town as the Preferred Alternative for Area 5.

In addition, DRPT and FRA conducted independent computer-based rail operations analyses, which estimated passenger and freight train performance in the corridor under several infrastructure alternatives in Area 5. This effort provided additional information that aided FRA and DRPT in the selection of Alternative 5A as the Preferred Alternative for Area 5. This refined operations analysis determined that while constructing a two-track western bypass or adding a third track to the existing CSXT railroad through the Town of Ashland would improve the efficiency of railroad operations through DC2RVA study Area 5, the additional capacity was not required to meet the Purpose and Need of the DC2RVA Project. Additionally, since Alternative 5A (Maintain Two Tracks through Town) provided adequate railroad capacity to meet the Purpose and Need of the Project, this alternative also resulted in the least impacts to historic properties. Should an alternative that avoids impacts to historic properties be feasible and prudent and meet the purpose and need of a project, then Section 4(f) of the U.S. DOT Act of 1966 requires FRA to select that alternative (see Chapter 6 of the Final EIS for the Final Section 4(f) Evaluation).

EVALUATION OF ALTERNATIVES

Chapter 4 of the Final EIS describes the Preferred Alternative within each area as well as its selection process, the reason / basis for selection, and any design changes since publication of the Draft EIS, which includes defining the Preferred Alternative in Area 1 and Area 5. A detailed mapbook of the Limits of Disturbance (LOD) of the Preferred Alternative is Appendix L of the Final EIS.

Note that the Final EIS does not republish all data and analyses at the same level of detail as the Draft EIS and its technical appendices (refer to Section 1.1.2 of the Final EIS for details). Refer to Chapter 2 of the Draft EIS and Appendix A of the Draft EIS for full details of all Build Alternatives in the Draft EIS, including the process that was used to develop, evaluate, and eliminate them.

CORRIDOR OPTIONS NOT EVALUATED IN THE DRAFT EIS

1. **Did the Project consider improvements outside of the existing rail corridor to improve train speed (such as construction of straighter lines, separate additional rail lines, flyovers, and/or tunnels)?**

The 2002 Tier I EIS and ROD, FRA and FHWA selected an incremental approach to develop the corridor (refer to Section 1.2 and Chapter 7 of the Final EIS for further discussion). As described there, a key element of the selected incremental approach was upgrading existing rail corridors in preference to developing new corridors (but did not preclude them if they provided the same benefits). This approach sought to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible and allowing access to existing stations and infrastructure. DC2RVA Project infrastructure improvements are limited to those necessary to meet the DC2RVA Purpose and Need, which preclude many of the suggested improvements.

However, the Draft EIS did evaluate alignments outside of existing railroad right-of-way—but connecting to existing rail corridors—as bypass alternatives for the City of Fredericksburg and the Town of Ashland because they are urban areas with limited right-of-way. The typical cross section of the new bypass alignments in these areas included a total of two tracks. DRPT determined that these bypass alignments would have higher impacts to property and natural resources and higher costs, and they generated substantial public opposition compared to the alternatives that added capacity within or followed the existing right-of-way. Neither of these bypass alternatives were selected as part of the Preferred Alternative; refer to Chapter 4 of the Final EIS for details. Additionally, the alternatives development process included other freight and/or passenger rail bypass alignment options that were dismissed from further consideration for similar reasons; refer to Appendix A of the Draft EIS for details.

2. **Did the Project consider moving all freight rail away/separate from passenger rail?**
   a. **It is disappointing that no cost/benefit study was made of the alternative of diverting substantial numbers of freight trains to the existing rail line in Maryland along the Route 301 corridor. The expense of building a new Potomac River bridge at Dahlgren and building connecting tracks to the RF&P line would be outweighed by both the homeland security benefits of bypassing the national capital and the benefits of freeing up the Fredericksburg-D.C. line for passenger rail.**

The Draft EIS did not consider completely separating freight and passenger rail away from the existing CSXT-owned/operated rail corridor between Washington, D.C. and Richmond. The Tier II EIS is the second step in a two-tiered federal environmental review process, building on the 2002 Tier I EIS that recommended passenger rail improvements in the 500-mile corridor between Washington, D.C. and Charlotte, NC. The 2002 Tier I EIS did evaluate other alignments in detail, but recommended adding additional track capacity within the existing railroad right-of-way between Washington, D.C. and Richmond. The 2002 Tier I EIS determined that building a new rail system dedicated to passenger or freight trains would cost more, result in more environmental impacts, and require extensive property acquisition. Conversely, sharing the rail system allows access to existing stations and infrastructure. This, in turn, allows the DC2RVA Project to be implemented more economically and minimizes impacts to the environment. Accordingly, and in line with the 2002 Tier I EIS recommendation for improvements within the existing rail corridor (in preference to new alignments), DRPT focused alternatives development within the existing CSXT right-of-way to minimize impacts and property acquisition. However, in areas where the right-of-way appeared potentially limited, or where other potentially reasonable alternatives were identified during Project scoping by stakeholders, DRPT evaluated a range of other alternatives, including new freight and/or passenger rail bypass alignments outside of existing CSXT right-of-way that would connect to existing rail lines, as detailed within the Alternatives Technical Report (Appendix A of the Draft EIS).

In response to a), in addition to what is stated above, evaluating a freight bypass around Washington, D.C. via a new Potomac River rail bridge at Dahlgren and connecting tracks to the existing rail line in Maryland along the Route 301 corridor is beyond the scope of the DC2RVA study, and is not in keeping with the Project's Purpose and Need, as set forth in the 2002 Tier I EIS. Subsequent to the completion of the 2002 Tier I EIS, and prior to the initiation of the DC2RVA Project, the National Rail Planning Commission prepared the Freight Railroad Realignment Feasibility Study in 2007[1] to evaluate the potential to construct freight rail bypass of Washington, D.C. from Central Virginia through Southern Maryland. The primary regional objectives of the study were to: mitigate security concerns related to the monumental core of Washington, D.C. and the U.S. Capitol; and accommodate the expansion of the passenger and freight capacity within the Washington, D.C. region of the East Coast rail corridor.

Although a new rail route connecting Central Virginia through Southern Maryland could divert some freight or passenger rail service from the CSXT RF&P corridor between Washington, D.C. and Richmond, VA, it would not meet the Purpose and Need of the DC2RVA Project. The advancement of the DC2RVA Project, however, would not preclude the consideration of a new rail bypass around Washington, D.C. in the future, which would be subject to separate environmental documentation at that time.

---

[1] https://www.ncpc.gov/docs/Freight_Railroad_Realignment_Study.pdf

3. Did the Project consider improving highway capacity, instead of and/or in addition to rail capacity?

The I-95 corridor carries more than 350 million tons of freight each year and more than 400,000 people a day[2]. The corridor is a vital conduit for national commerce and trade that connects northeast consumer markets with southeastern ports and manufacturing centers, accounting for 20 percent of the U.S. gross domestic product and making it the fourth largest economy in the world. Congestion on I-95 and parallel rail lines challenges the efficiency of the workforce and the freight network. To address these problems, the Commonwealth has taken a multimodal approach, including highway, rail, and other improvements under the heading of the Atlantic Gateway Program. The Atlantic Gateway is a multimodal suite of projects focused on the I-95 corridor between Washington, D.C. and Fredericksburg, VA, and includes a combined suite of freight and commuter rail, highway, and technology components. The DC2RVA Project is specifically focused on improving intercity passenger rail in the corridor between Washington, D.C. and Richmond, and overlaps with the Atlantic Gateway Program.

The Purpose of the DC2RVA Project is to increase railroad capacity between Washington, D.C. and Richmond to deliver higher speed passenger rail while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. Consideration of additional highway/roadway capacity beyond that necessary to improve existing road/rail crossings to meet the needs of the DC2RVA Project is beyond the scope of the Tier II effort. The Atlantic Gateway highway and rail improvements will expand upon and work in concert with the DC2RVA Project improvements to improve transportation choice and efficiency in this vital corridor.

4. Did the Project consider rail in the I-95 corridor right-of-way and/or within powerline right-of-way?

In the 2002 Tier I, FRA and FHWA recommended adding additional track capacity within the existing railroad right-of-way, which is owned and operated by CSXT. Building a new rail system dedicated only to passenger trains would cost more, result in more environmental impacts, and require extensive property acquisition. Conversely, sharing the rail system allows access to existing stations and infrastructure. This in turn, allows the Project to be implemented more economically and minimizes impacts to the environment.

In keeping with the recommendations of the 2002 Tier I EIS, and the DC2RVA's Purpose and Need, DRPT focused development of alternatives for the DC2RVA Project within the existing CSXT right-of-way to minimize impacts and property acquisition. However, in areas where the right-of-way appeared limited, or where other potentially reasonable alternatives were identified during Project scoping, DRPT evaluated alternatives outside the existing CSXT right-of-way, including new alignments alongside or within existing power line and interstate rights-of-way, to ultimately connect back to existing rail corridors. However, all of these alternatives were dismissed from inclusion in the Draft EIS environmental evaluation for the reasons noted above. Appendix A of the Draft EIS describes the range of alternatives identified and evaluated, including those dismissed from further consideration.

---

[2] http://www.atlanticgateway

Specifically, within the Ashland Area, the range of alternatives included five options for an eastern bypass around the Town of Ashland, all of which ran alongside an existing power line right-of-way for some portion of their alignment. Two of the eastern bypass options would use the median of I-95 and one option would run alongside the right-of-way of I-95 just east of Ashland. DRPT eliminated these eastern bypass options from further consideration during the screening process due to their cost, impacts to existing infrastructure, environmental resources, and extensive property acquisition. The Ashland/Hanover CAC (see Section 2.1 of the Final EIS) also looked at these and other eastern bypass alignments and eliminated an eastern bypass from consideration as well.

5. **Did the Project consider having two freight lines and two high speed passenger rail lines?**

In the 2002 Tier I EIS, FRA and FHWA determined the Project would be developed incrementally along the existing CSXT-owned rail corridor between Washington, D.C. and Richmond, and that intercity passenger, commuter, and freight rail service would use the same tracks to maximize use of existing infrastructure. DRPT's analyses described in the Draft EIS show that for most of the corridor, adding one main track to the existing CSXT corridor provides sufficient additional capacity for intercity passenger, commuter, and freight rail, in order to meet the Project's Purpose.

6. **Did the Project consider a three-track option with overtaking lanes (i.e., outer tracks would handle freight traffic and inner track would be utilized for passenger rail service only, in both directions)?**

Based on prior corridor studies, including the 2002 Tier I EIS and the 2009 Virginia I-95 High Speed Rail Corridor & Service Development Plan (both of which are described in Section 1.2 of the Final EIS), FRA and DRPT determined that the most efficient means of adding capacity to the existing corridor was through an incremental process using existing rail corridors, and by adding capacity to the existing corridors through the addition of a main track with crossovers such that all main tracks are interoperable by intercity passenger, commuter, and freight trains. Interoperability of the main tracks maximizes the corridor's capacity, speed, and flexibility for all trains.

ASHLAND AREA ALTERNATIVES

1. **How and why was a western bypass alternative in the Ashland area brought forward as an alternative in the Draft EIS?**

The DC2RVA Project generally proposes additional rail capacity, in the form of an additional main track, be added alongside the existing tracks and within the CSXT-owned right-of-way to minimize costs and impacts. However, in the Town of Ashland, the CSXT right-of-way is too narrow to accommodate a potential third track—additional right-of-way would be required if a third track was placed through the town. Therefore, in response to public input during DC2RVA scoping and alternatives development phases, DRPT evaluated numerous bypass alignments, including both eastern and western bypasses. The bypass alignments were considered as options that avoided/minimized the potential impacts caused by expanding the rail corridor through the Town of Ashland. After screening the bypass alignments for potential significant environmental impacts and effects on infrastructure, DRPT selected Ashland West Bypass #4 (AWB4) for detailed evaluation in the Draft EIS, which is included as Build Alternatives 5C and 5C–Ashcake.

Refer to question Public Involvement #2 and #3 in the section above regarding development of the Town of Ashland/Hanover County CAC and its outcome. The mission of the CAC was to take a fresh look at a wide range of alternatives for Alternative Area 5, including reexamining eastern and western bypass alternatives. After review of all Ashland area alternatives, the CAC identified AWB1 as the "least objectionable" western bypass alternative; refer to Appendix G of the Final EIS for full summary of CAC activities.

Ultimately, FRA and DRPT determined that the additional capacity and operational efficiency provided by either a third track through town or a bypass around the town did not justify the cost and environmental impacts associated with the additional capacity. The Preferred Alternative for Area 5 was selected as 5A, which maintains two tracks through town; the reasons for its selection are detailed in Section 4.3.5 of the Final EIS. No bypass alternatives were selected as part of the Preferred Alternative in the Final EIS.

2. **Support for options not evaluated in the Draft EIS**
    a. **One elevated track through downtown Ashland**
    b. **Tunnel beneath the Town of Ashland**
    c. **Bypass for vehicular traffic around Ashland**
    d. **Use of the existing eastern rail alignment (i.e., the Buckingham Branch Line)**

In response to a), DRPT evaluated a raised rail trestle or viaduct through the Town of Ashland as a potential option to add rail capacity along the existing corridor (see Appendix A—Alternatives Technical Report of the Draft EIS). The rail trestle or viaduct was eliminated during the screening process due to impacts to existing infrastructure, as well as public concerns over impacts to historic resources, noise, and aesthetics. Rather, DRPT advanced alternatives to the Draft EIS that included the construction of a third track at-grade through the Town of Ashland—Alternatives 5B, 5B–Ashcake, and 5D–Ashcake, and construction of a two-track western bypass—Alternative 5C and 5C–Ashcake.

In response to b), DRPT evaluated tunnel options as part of the alternatives development process of the Draft EIS. Tunnel options included a deep-bore tunnel into bedrock, a mixed tunnel in both bedrock and the unconsolidated overburden, and a cut-and-cover tunnel. These tunnel options were documented in the Alternatives Technical Report (Appendix A of the Draft EIS) but were eliminated from further consideration during the screening process due to concerns over cost and impacts during construction, effects on nearby structures, and the long-term impacts of the above-ground ventilation facilities on the Town of Ashland. Subsequently, during the Ashland/Hanover Area CAC process to review the Area 5 alternatives, tunnels were reviewed by the CAC and eliminated from further consideration due to their relatively higher cost compared to other area alternatives.

In response to c), the Purpose of the Tier II DC2RVA Project is to increase railroad capacity between Washington, D.C. and Richmond to deliver higher speed passenger rail while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail. Consideration of additional highway/roadway capacity beyond that necessary to improve existing road/rail crossings to meet the needs of the DC2RVA Project is beyond the scope of the DC2RVA Tier II effort. The DC2RVA Project does not preclude future non-rail capacity improvements studies or projects, separate from this EIS process.

In response to d), DRPT evaluated the use of the Buckingham Branch Railroad (BBR) as well as other eastern bypass options as potential alternatives to adding rail capacity along the existing corridor in the Ashland/Hanover area (see Appendix A—Alternatives Technical Report of the Draft EIS). The BBR and other eastern bypass options were eliminated during the alternatives screening process due to impacts to parks, wetlands, historic resources, and existing infrastructure. Routing passenger trains via the BBR would not allow trains to serve Staples Mill Road Station in Richmond in Alternatives 6A, 6E, 6F, and 6G. Additionally, routing freight trains via the BBR would increase the travel time for freight trains operating between Washington, D.C. and Richmond, and would increase freight rail congestion within Richmond by routing additional freight traffic from Acca yard to the BBR. The BBR and eastern bypass options were reevaluated by the Ashland/Hanover CAC and again eliminated from consideration. Under the Preferred Alternative, CSXT will continue to route freight trains on the BBR from Richmond through Doswell, VA, as necessary.

3. **Could the proposed alignments through the Ashland Area (Area 5) be modified to have less impacts overall, especially to homes?**

The Preferred Alternative for Area 5 was selected as Alternative 5A, which maintains two tracks through town and adds an additional track north and south of the town, and has the least residential impacts of any Build Alternative that was evaluated in the Draft EIS. The conceptual design of the Preferred Alternative through Area 5, as described in Section 4.3.5 of the Final EIS, has been refined since the Draft EIS evaluation and does not have any residential impacts in the Ashland Area.

All of the impact analyses in the Draft and Final EIS are based on conceptual engineering, which was revised between the Draft and Final evaluations and further minimized certain impacts (refer to Chapter 4 of the Final EIS for details). The Preferred Alternative will be further refined during final design, after funding is available and incremental improvements are scheduled, to further minimize impacts to environmental resources and property throughout the entire Project corridor.

RICHMOND AREA ALTERNATIVES

1. **How will the Project route trains on the S-Line in Richmond? Isn't exclusively using the S-Line a missed opportunity of capacity for the existing A-Line?**

Full descriptions of routing for the Preferred Alternative through Richmond is provided in Section 4.3.6 of the Final EIS. The Preferred Alternative for Area 6 (Alternative 6F: Full Service, Staples Mill Road/Main Street Stations) will route all north-south passenger trains through downtown Richmond along the S-Line, with the exception of the Auto Train which will continue to use the A-Line. Passenger trains will diverge from the CSXT RF&P Subdivision just north of the Staples Mill Road Station onto a new passenger train bypass around the east side of the Acca Yard terminal, which will include new level-boarding station platforms to serve the Staples Mill Road Station. South of Acca Yard, passenger trains will use the existing S-Line, which will be rebuilt and expanded, to access Main Street Station in downtown Richmond. Trains bound for Norfolk, North Carolina, and southern destinations will continue south on the S-Line past the west side of Main Street Station south to Centralia, where they will rejoin the CSXT A-Line. Amtrak's Newport News passenger service will leave the S-Line to continue east of Main Street Station onto the Peninsula Line. The use of the S-Line for north-south passenger trains through Richmond also validates the Preferred Alternative of the Richmond-to-Raleigh (R2R) Tier II EIS, the Preferred Alternative for the Richmond to Hampton Roads Tier I EIS, and is supported by FRA's Station Area Planning guidance that emphasizes downtown station locations.

Rebuilding the S-Line as the main passenger train route through downtown Richmond supports the DC2RVA Project's goal of providing a competitive passenger rail transportation option for travelers by providing downtown-to-downtown service between Washington and Richmond. In addition, the potential for conflicts between passenger and freight trains in the Richmond terminal area will be reduced, since most north-south freight traffic through Richmond will continue to use the A-Line, while passenger trains will use the S-Line. Options to expand rail capacity on the A-Line to support both the expanded passenger service and forecasted increases in freight traffic are limited, or cost-prohibitive, owing to the line's location in the median of I-195 in Richmond. DRPT conducted computer-based rail operating simulations that provided estimates of future freight and passenger train performance on alternatives using both the S-Line and A-Line as the primary passenger route through Richmond. Based on those simulations, DRPT concluded that the diversion of passenger trains onto the S-Line allowed for two primary freight and passenger corridors for north-south traffic through Richmond, which would reduce the potential for conflicts between freight and passenger trains and enable passenger trains to meet the Project's on-time performance goals.

However, DRPT believes that the A-Line offers much needed redundancy in the Richmond area's passenger and freight rail network should unforeseen occurrences inhibit the movement of trains via the S-Line. The infrastructure improvements proposed by the DC2RVA Project do not preclude use of the A-Line by passenger trains in the event of unforeseen occurrences that would prevent the use of the S-Line for passenger service.

2. **The Richmond Area improvements should be further broken down into smaller projects that will allow for the steady increase of passenger rail service at Main Street Station to Hampton Roads and the Southeast United States.**

The DC2RVA Project provides additional capacity to support 9 new daily intercity passenger round trips (18 total trains per day) between Washington, D.C. and Richmond, and extending north to the NEC. This new service includes one new round trip originating at Richmond Main Street Station, one new roundtrip extending south to Newport News, three new roundtrips extending south to Norfolk, and four new round trips extending south to Raleigh and Charlotte, NC. Refer to Section 4.2 of the Final EIS for description of the proposed service plan. DRPT is preparing a Corridor Service Development Plan as part of the DC2RVA Project, which will include a proposed service implementation schedule; refer to Section 7.3 of the Final EIS for details.

DRPT anticipates that the DC2RVA Project, and its proposed 9 new daily intercity passenger round trips (18 total trains per day), will be implemented incrementally, as funding becomes available. Refer to Chapter 7 of the Final EIS for an overview of the anticipated future steps for Project implementation and construction.

STATION EVALUATION

1. **Concern about which stations are being served by new DC2RVA service throughout the corridor, why those locations were chosen, and/or suggestions of additional stations or transit services that should be added along the corridor**

DRPT evaluated potential new passenger rail stations for their suitability to serve as intercity passenger rail stations in the DC2RVA corridor, as described in Section 2.3.3.2 of the Draft EIS, and plans to incorporate the proposed passenger train service into Amtrak's existing intercity passenger rail network. Under the proposed service plan for Preferred Alternative as described in Section 4.2 of the Final EIS, existing station locations that will be served by the proposed service include: Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and Richmond (existing Staples Mill Road and Main Street Stations). All upgrades to existing station facilities served by the Project are included in the description of the Preferred Alternative in Section 4.3 of the Final EIS.

Several locations for potential new or replacement intercity passenger stations were identified during the Project scoping phase based on public input and recommendations from prior corridor studies. However, ultimately DRPT determined that no new stations were needed to meet the Purpose and Need for the Project. However, the Project does not preclude future changes to service patterns and intercity passenger rail station locations, nor does it preclude development of new station locations in the future along the corridor, separate from this Project and its environmental process. the Final EIS

Multimodal access to high speed rail stations, including highway, public transit, and other modes, was one of the evaluation criteria for selecting which stations could receive additional passenger service under this Project; additional detail on multimodal access to the corridor rail stations is provided in Appendix A of the Draft EIS.

Several of the Amtrak stations also serve VRE's commuter rail service, including Alexandria, Woodbridge, Quantico, and Fredericksburg stations. VRE has other stations along the corridor which are not served by Amtrak. The Amtrak/VRE Alexandria Station is adjacent to a WMATA Metrorail station, and all of the Amtrak stations in the Project corridor, with the exception of Ashland, are served by local/regional bus routes. Further, Richmond's Main Street Station is now served by the City's new Bus Rapid Transit System. However, the DC2RVA Project does not include any provisions to develop or implement new transit service to a station because addition of any new service is under the purview of local and regional authorities, and not DRPT.

2. **Concern about which stations are being served within Richmond, their operations, and/or their connections to other modes of travel**

As described in Chapter 2 of the Draft EIS, DRPT evaluated two primary route alignment alternatives in the Draft EIS for the Richmond Area to determine which route was best capable of providing the capacity required to support the DC2RVA Purpose and Need: one route passes west of downtown on the CSXT A-Line, and the other passes through downtown via the CSXT S-Line. In addition to the routing options, the Draft EIS evaluated four unique station locations with eight different station service alternatives in the Richmond area serving multiple route and station combinations. DRPT also evaluated other potential station locations in the Richmond area as part of the alternatives development process, which were dismissed from further consideration during screening (refer to the Alternatives Technical Report, Appendix A of the Draft EIS, for full details).

Section 4.3.6 of the Final EIS fully describes the station improvements, amenities, and operations at Staples Mill Road and Main Street Stations as part of the Preferred Alternative. Based on the cost estimates, levels of impact, and ridership projections presented in the Draft EIS, DRPT determined that having both a downtown station and a suburban station would provide the most flexible service, and Alternative 6F: Full Service, Staples Mill Road/Main Street Stations was selected as the Preferred Alternative. The Preferred Alternative will run all passenger train service that stops in Richmond on the S-Line, thus separating it from CSXT's principal freight corridor (the A-Line); this configuration will reduce rail congestion and delay. The Amtrak Auto Train, which does not stop in Richmond, will continue to use the A-Line.

All intercity passenger trains that stop in Richmond, including the 9 new daily intercity passenger round trips (18 total trains per day), will serve both Staples Mill Road Station and Main Street Station. Additionally, Main Street Station is unique in that passenger trains will be rerouted to it as part of the Preferred Alternative. Main Street Station currently serves two existing daily round trips (four total trains per day).

Under Build conditions of the Project, the S-Line will be rebuilt, enabling all existing and proposed new intercity passenger trains stopping at Richmond to serve both Staples Mill Road and Main Street Stations. As a result, Main Street Station will see a total of 18 daily round trips (36 total trains per day), which is an increase of 16 daily round trips (32 total trains per day) above the current service level at Main Street Station. Of those, the DC2RVA Project will add 9 new daily intercity passenger round trips (18 total trains per day) and also reroute 7 existing round trips (14 existing total daily intercity passenger trains). Main Street Station will provide for convenient connection to Richmond's transit system, including multiple bus routes and the City's new Bus Rapid Transit (BRT) system.

While Main Street Station site constraints and concerns over potential impacts to cultural resources limit the number of tracks and length of platforms proposed for the station, future passenger service amenities to be provided at the station, such as checked baggage service, are not precluded. Amenities to be provided at each station for a particular passenger service will be determined by DRPT in coordination between Amtrak, the City of Richmond, and other station stakeholders, and are not included as part of the DC2RVA Project. DRPT has assumed that Amtrak's scheduled crew changes in the Richmond area, which currently occur at Staples Mill Road Station, would continue to occur at Staples Mill Road Station under the Preferred Alternative.

3. **Concern regarding proposed level of boarding platforms at stations as part of Project improvements**
    1. **The Project should ensure that all platforms are at train-door level so that ADA customers do not have to utilize a lift / wait for the conductor to find a ramp at the station.**
    2. **Not having "high-level" platforms in this Project adds travel time to trips. It looks like the Project will have at least four stations (if not more) that are "low-level" and that's going to add at least two minutes to every train in both directions.**
    3. **The objections to "high-level" platforms seem to be that VRE owns equipment designed for "low-level" platforms and that freight railroads don't like "high-level" platforms, but there has to be a solution to those concerns from other places in the country.**

In response to a), b), and c), federal regulations (49 CFR Parts 37 and 38) require passenger rail stations to have boarding platforms that are level to the floor of the railcar, wherever it would not be prevented by freight train clearance requirements. However, the different types of passenger, freight, and commuter trains sharing the tracks of the DC2RVA corridor have different height and clearance requirements, which prevents the use of level-boarding platforms at many of the stations in the DC2RVA corridor. For example, the floor height of Amtrak passenger cars is approximately 48 inches above the top of the rail, whereas the floor height of VRE commuter railcars is much lower and requires a station platform no more than 8 inches above the top of the rail. In addition, the width of certain freight cars operating in the DC2RVA corridor extends far enough outside the width of the rails that a 48-inch-high station platform would obstruct their movement. As a result, at stations where the platforms serve tracks used by passenger, freight, and commuter trains, the platform cannot be more than 8 inches above the top of the rail.

The DC2RVA Project has prepared a Basis of Design Report (see Appendix B of the Draft EIS) that governs all new station platform construction and reconstruction of existing platforms. The Basis of Design states that boarding for the mobility-impaired transit users shall be provided by one or more of the following methods:

- Level-boarding platforms (sometimes referred to as "high-level" platforms, as the platform is 48 inches higher than the top of rail). Level-boarding platforms provide level boarding where they would not conflict with freight train clearances.
- Railcar-equipped wheelchair lifts. Railcars equipped with mechanical lifts provide persons with disabilities access to all railcars.
- Wheelchair lifts at low-level platforms. At low-level platforms (8 inches above the top of rail) that do not provide level boarding, portable wheelchair lifts can be utilized to provide equal access as required by the Americans with Disabilities Act of 1990 (ADA).

Within the DC2RVA Project, Staples Mill Road Station is the only location where platforms will be located on new tracks that will serve only passenger trains, which will allow for the construction of level-boarding platforms (48 inches above the top of rail). However, Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and Richmond Main Street Station have platforms that are served from tracks also used by freight trains and, in some cases, VRE commuter trains as well, and as a result, will require low-level platforms (8 inches above the top of rail). At the stations where level-boarding is not permissible, DRPT or Amtrak (or other sponsoring agency) will be required to submit a level-boarding plan to FRA's Office of Civil Rights demonstrating that the proposed method (railcar-equipped lifts, wheelchair lifts, etc.) will meet the objectives of ADA.

4. Are future parking demands being addressed / increased at stations as part of this Project?

DRPT used an Amtrak-approved methodology to determine the parking demand at each existing intercity passenger rail station in the DC2RVA corridor (Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and the two existing Richmond stations) for each Build Alternative evaluated in the Draft EIS. Parking capacities were based on DC2RVA ridership projections for the year 2045. Factors that affect parking demand include type of station (i.e., station location in an urban or more rural area, as urban stations are assumed to have greater access to public transit options and therefore require less parking) as well as type of Amtrak service (i.e., there are different parking requirements for long distance versus regional train passengers, and business versus non-business passengers). Refer to Section 4.5.2 of Appendix S of the Draft EIS for parking calculations, the results of which are summarized in Section 4.15 of the Draft EIS. An updated summary of the parking needs for the Preferred Alternative is provided in Section 5.15.1.4, and includes description of parking facilities at each station.

The conceptual layouts for each station site that are shown in the station alternative figures in Chapter 4 of the Final EIS are additionally based on the physical characteristics of the station site, the DC2RVA Basis of Design, the functional requirements of Amtrak, and/or Project refinements to the Preferred Alternative that have occurred since the publication of the Draft EIS. A multi-story parking garage sufficient to meet the parking demand is proposed at the Fredericksburg Station as part of the Preferred Alternative. Since the publication of the Draft EIS, DRPT removed proposed parking improvements from the Preferred Alternative at the stations at Ashland in the Final EIS due to the relatively low increase in ridership proposed for those stations and availability of nearby private or publicly owned parking facilities; in addition, there was no local support for additional parking infrastructure dedicated to intercity passenger rail customers during review of Project Build Alternatives (see Appendix G for details on the CAC). DRPT also removed the proposed parking improvements at Main Street Station in Richmond as part of the Preferred Alternative due to its location in an urban area, availability of public transportation options, the presence of existing private or publicly-owned parking facilities, and concerns to potential impacts to historically sensitive resources in the station area. Additionally, at Staples Mill Road Station, in July 2018 Amtrak completed an expansion of the parking at the Staples Mill Road Station, from 274 parking spaces to 589 parking spaces. The completed parking improvements include a dedicated bus loading zone, bike racks, taxi/ride-share parking, improved pedestrian accommodations, additional ADA parking and two entrances via Staples Mill Road and Bremner Boulevard. This expanded parking lot meets the projected parking demand estimated for the DC2RVA Project, and no further parking improvements are recommended as part of the Project.

5. **Station-specific concerns**
    a. **Carmel Church Station has been supported by the last three administrations and has been included in the last two Virginia State Rail plans. It was studied in depth by DRPT and affirmed in the Amtrak Station Area Planning and Land Use Analysis study from August 2008. While the Project states that it does not preclude the development of new stations, the Project should include the station that the Caroline County community has been working on with the full support of the Commonwealth.**
    b. **In Fredericksburg, the Project should look into renovating the current historic station as a passenger station rather than building a new station.**
    c. **What is happening at the Ashland Station? The Project needs to be sensitive to the aesthetics of the historic building.**

In response to a), DRPT acknowledges the previous and ongoing support of a station location at Carmel Church. DRPT evaluated the potential for a new intercity passenger rail station at Carmel Church (see Section 8.3.5.8 of the Alternatives Technical Report, which is Draft EIS Appendix A). A Carmel Church station has been previously proposed in conjunction with a new mixed-use development known as the Carmel Church Community and Village; however, this development has not begun, and the area remains largely rural with low density single family residential and some industrial uses. DRPT considered and dismissed the Carmel Church location for development of a new train station as part of the DC2RVA Project due to its lack of development and its relatively low population density (and potential ridership) in the area. This does not preclude addition of a station at Carmel Church in the future if conditions change and the potential ridership warrants a new station.

In response to b), the Draft and Final EIS includes a conceptual footprint (and cost) for a new station in Fredericksburg on land currently used for surface parking. The conceptual footprint provides a basis for the Draft EIS impact evaluation but is not intended as a final determination on station layout. Final station design for any station in the DC2RVA corridor is not part of the Project. Any final design for a new station will be coordinated with Amtrak, the City of Fredericksburg, and other stakeholders. The potential use of the existing historic station could be evaluated during final design, should it be determined necessary at that time.

In response to c), the Ashland Train Station is both individually eligible for the National Register of Historic Places (NRHP) and as a contributing resource to the Ashland Historic District; as such, any changes made to this building or landscape as part of the DC2RVA Project would require an analysis to see if the changes adversely impact the station. The historic train station building is used as a visitor's center for the Town of Ashland and is not part of the Amtrak station.

However, there are no proposed changes to the station or its two brick platforms as part of the DC2RVA Project. In accordance with the September 2017 recommendation of the Town of Ashland/Hanover County CAC and with the December 2017 resolutions of the CTB, Build Alternative 5A: Maintain Two Tracks Through Town was selected as the Preferred Alternative. As selected, the Preferred Alternative in Area 5 will not include any roadway or station modifications within downtown Ashland (refer to Section 4.3.5 of the Final EIS for details). In a separate ongoing project, Amtrak is working with the Town of Ashland and FRA to improve the existing station platforms to meet ADA requirements.

ENVIRONMENTAL IMPACTS

Chapter 5 of the Final EIS documents the potential effects on the human, physical, and natural environments that may result from construction and operation of the Preferred Alternative for the Project. The effects presented in Chapter 5 are based on the conceptual engineering Limits of Disturbance (LOD) for the Preferred Alternative in each of the six areas defined for the Project, as defined in Chapter 4 of the Final EIS and its Appendix M.

GENERAL

1. **Is there no route which would not impact local citizens?**

The 2002 Tier I EIS established the general alignment for the SEHSR corridor, including the DC2RVA corridor between Washington, D.C. and Richmond, VA, ensuring connectivity with the future improvements to the NEC north of Washington, D.C. The 2002 Tier I EIS recommended that improvements be constructed within the existing railroad right-of-way to the extent possible in an effort to minimize physical impacts. The Basis of Design for the DC2RVA Project (see Appendix B of the Draft EIS) followed, to the extent practical, this recommendation for remaining within the existing right-of-way. Nonetheless, the DC2RVA Project requires some improvements outside the existing right-of-way in locations of limited right-of-way width, areas where speed-limiting curves needed to be flattened (or reduced), major river crossings where road/rail crossings required modifications, and other locations with limiting characteristics. The only alternative considered in both the Tier I and Tier II evaluations that would not require any additional right-of-way (and associated physical impacts) would be the No Build Alternative. However, FRA and FHWA determined in the 2002 Tier I EIS that the No Build Alternative did not to satisfy the Project's stated purpose and need and was thus considered not to be a viable alternative. DRPT considered the No Build Alternative as a baseline for evaluation as part of this Project, but confirmed the findings of the 2002 Tier I EIS that the No Build Alternative is not a viable alternative to meet the Project Purpose and Need. See Section 4.4.2 of the Final EIS for more detail.

2. **The environmental impacts and/or monetary cost of the Project are not worth the projected time-savings of passenger rail. High speed rail is prohibitively expensive when compared to the time-savings for passengers using these trains. It is not fair to ask residents to "pay" for this when they will not be seeing any benefit.**

The purpose of the DC2RVA Project is to increase capacity to deliver higher speed passenger rail, expand commuter rail, and accommodate growth of freight rail service in an efficient and reliable multimodal rail corridor. The increased capacity will allow for an increase of 9 new daily intercity passenger round trips (18 total trains per day), improve the reliability of on-time performance, and reduce travel time for all intercity passenger service in the corridor. Benefits of the Project and a comparison of the benefits to the No Build Alternative are documented in the Draft EIS. Improvements associated with the DC2RVA Project will also benefit non-rail users, such as improved safety of highway-rail crossings, reduction in growth of highway traffic congestion, and improvements in regional air quality. A detailed public benefits analysis is included in the Project's Corridor Service Development Plan, which is being prepared by DRPT as part of the DC2RVA Project (see Section 7.4 of the Final EIS for further details).

TRAFFIC / TRANSPORTATION

1. Concern about safety and/or accessibility of public at-grade roadway crossings as evaluated in the Draft EIS

In accordance with the FRA's High Speed Passenger Rail Safety Strategy, the Draft EIS analyses assumed that the Project would provide a minimum of active gates and lights at all public at-grade crossings. As part of that minimum protection, two types of active gates and light systems are recommended as part of the Project at public crossings:

- **Four-quadrant gates:** This system includes four gates (entrance and exit gates on all roadway approaches) designed to provide full closure of the crossing when a train is approaching or occupying the crossings, thus eliminating the opportunity for vehicles to navigate around a lowered gate. The design can include detection inside the gate to ensure that vehicles do not get "trapped" inside lowered gates.
- **Median treatment (non-traversable) with center gates:** This system includes physical improvements designed to impede the movement of vehicles into the opposing traffic lane and around a lowered gate. Typical treatments can include barrier wall systems, wide raised medians, and mountable raised curb systems with vertical median separators.

In addition to the two minimum treatment types above, DRPT also evaluated at-grade crossing elimination (which includes potential grade separation and crossing closure of existing at-grade crossings) as part of the Project.

Safety of all users and vehicle accessibility (i.e., connectivity of the roadway network) were two primary considerations during the crossing treatment review as part of the Draft EIS. DRPT applied FRA and FHWA guidance, which includes calculation of rail and roadway traffic and speeds, to determine if each at-grade crossing should be considered for grade separation or crossing closure, or if active gate systems (as described in the bullets above) would be sufficient. DRPT then determined specific crossing treatment recommendations for each crossing based on safety needs, the geometry of parallel/intersection crossing roadways to ensure safe and efficient vehicle operations, life-cycle cost efficiencies, construction feasibility, environmental impact, and operating conditions within the rail corridor. Discussion of this decision process can be found in Section 4.15.2.1 of the Draft EIS, with additional information in Section 5.2 of its Appendix S (Transportation Technical Report).

The proposed crossing treatments at each public at-grade crossing for the Preferred Alternative are summarized in traffic/transportation response #2 below, and fully detailed in Section 5.15.2.2 of the Final EIS. As detailed there, the Preferred Alternative includes "no action" at several existing at-grade crossings, in locations where other/future projects or actions will provide additional safety improvements.

Further, dynamic crossing safety technology to control exit gates (such as embedded loops or radar as part of active gate systems) will be included during the final design of the Project, as applicable, and is subject to FRA Office of Railroad Safety approval, at the time of that design.

2. What is happening to the existing at-grade treatments in the corridor (public crossings)?

The proposed crossing treatments at each public at-grade for the Preferred Alternative are presented in Section 5.15.2.1 of the Final EIS and shown on the detailed Preferred Alternative mapbook in Appendix L of the Final EIS, and include the following:

- **Grade separations**: 7 crossings
- **Closure:** 7 crossings
- **Four-quadrant gates**: 13 crossings
- **Center median treatment**: 8 crossings
- **No action:** 8 crossings

These treatments are the same as evaluated in the Draft EIS, with three exceptions (listed north to south in the Project corridor):

1) The removal of one four-quadrant gate improvement in Northern Virginia (Potomac Road) from the Project, to align with the decisions made as part of the separate Powells Creek to Arkendale project in this same area (refer to Final EIS Section 4.3.2 for details).

2) The Preferred Alternative through Area 5 (Alternative 5A) will not improve any existing at-grade crossing treatments between Vaughan Road (Archie Cannon Drive) and Ashcake Road under the DC2RVA Project. Further, College Avenue/Henry Clay Street will remain open with no proposed changes as part of the Preferred Alternative. This differs from the evaluation as shown in the Draft EIS, which included proposed four-quadrant gates at all at-grade crossings within Town (which would require property and/or traffic operations impacts) and required closure of the College Avenue crossing (due to conflicts with station platform improvements that were shown in the Draft EIS). The recommendation for proposed grade separations at Vaughan Road (Archie Cannon Drive) and Ashcake Road remain in the Preferred Alternative, as analyzed in the Draft EIS. The CTB further committed DRPT to explore potential improvements in the Town of Ashland that will "help protect the safety of motorized and non-motorized roadway users." DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

3) The addition of one grade separation in Henrico County (Hermitage Road), which replaced a previous recommendation of four-quadrant gates in the Draft EIS evaluation.

3. Concern over private driveway access and/or crossing treatment throughout the corridor

DRPT's process to determine crossing treatments at private at-grade crossings followed a similar site-specific process as public at-grade crossings (as summarized in traffic/transportation response #1 above). Safety and accessibility were two key factors in the process.

Most of the existing private crossings currently have warning signs only, although a few have locking gates. Wherever practicable, existing private crossings are maintained, albeit with additional safety measures, as detailed in Section 5.15.2 of the Final EIS. At private crossings, the Preferred Alternative includes locking gates at most existing private at-grade crossings; however, four-quadrant gates are proposed at private locations in the Richmond area where site-specific safety, geometric, and/or operating conditions were determined to preclude use of locking gates. If access to private property cannot be maintained or provided in kind, the property would need to be acquired, as detailed in Section 5.11.4 of the Final EIS.

Locking gates will not impede the owner's access to the private crossing, but will provide an additional measure of safety for both vehicles and trains at the crossing. DRPT anticipates that locking gates will be tied to train control, and private property owners will need to "request" that their crossing gate be opened. However, details of technology and design of the track circuit interlock will be determined as part of the final design of the Project and is subject to FRA and CSXT approval at the time of that design. DRPT will coordinate with property owners to determine means of access to each property during final design.

4. **Ashland-specific traffic concerns**
   a. **In Ashland, the proposed alternatives would not increase safety of at-grade roadway crossings, especially at the main intersection in downtown Ashland (England Street / Thompson Street crossing).**
   b. **In Ashland, railway traffic currently affects traffic flow by blocking intersections up to 15–20 minutes. This is not covered in the Draft EIS.**
   c. **There has not been adequate attention to how disruptive the destruction/ construction through the town of Ashland would be. Shutting down Center Street for several years will create an inconvenience to all residents.**

In response to a), the Draft EIS alternatives considered for downtown Ashland included safety upgrades to the at-grade road and pedestrian crossings in keeping with FRA's Safety Strategy (see Section 4.15.2.1 of the Draft EIS, with additional information in Section 5.2 of its Appendix S (Transportation Technical Report), for specific recommendations by alternative and road crossing). DRPT also analyzed the existing and projected future traffic on the at-grade road crossings to determine the potential need for grade-separations to improve safety and traffic flow, as well as site-specific physical conditions and rail operating conditions. DRPT did not recommend a grade separation at England/Thompson Street under any Build Alternative analyzed in the Draft EIS due to the potential impacts to traffic and adjacent properties from the infrastructure required for a grade separation at that location.

The Preferred Alternative (Alternative 5A: Two Tracks Through Town) includes grade separations be constructed at Vaughan Road (Archie Cannon Drive) and Ashcake Road in Ashland to improve safety, emergency response, and traffic flow throughout town. Additionally, the CTB's resolution recommending Alternative 5A for the Ashland/Hanover area also directed DRPT to explore the need for other safety improvements to pedestrian and vehicle at-grade crossings and to improve emergency vehicle access within the Town of Ashland, and to avoid or minimize any property acquisitions in downtown Ashland where the corridor would remain two tracks. Therefore, DRPT is committed to work with the FRA, the Virginia Department of Transportation (VDOT), Town of Ashland, Randolph-Macon College, and CSXT to identify safety improvements for pedestrians and vehicles crossing the tracks in Ashland that minimize the acquisition of additional right-of-way. DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

In response to b), the Draft EIS included an analysis of total daily delay experienced by vehicles at at-grade crossings based on Project-specific variables, which can be found in Section 4.15.2.4 of the Draft EIS, with additional information in Section 5.5 of its Appendix S (Transportation Technical Report); note that updated total daily delay results for the Preferred Alternative are presented in Section 5.15.2.4. The amount of time that a road is blocked by a passing train in

Ashland depends on several variables, including (a) the length of the train, (b) whether a train is making a station stop at Ashland, and (c) the speed of the train. The maximum train speed through Ashland is limited to 35 mph. The Preferred Alternative in Ashland (Alternative 5A) includes grade separations at both Vaughan Road (Archie Cannon Drive) and Ashcake Road in Ashland; these two grade separations will provide an alternative to drivers using the England Street at-grade crossing. The CTB's resolution also directed DRPT to explore the need for other potential improvements in downtown Ashland that will help protect the safety of motorized and non-motorized roadway users, and to facilitate emergency access, separate from the DC2RVA Project. DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

In response to c), in accordance with the September 2017 recommendation of the Town of Ashland/Hanover County CAC and with the December 2017 resolutions of the CTB, Alternative 5A: Maintain Two Tracks Through Town was selected as the Preferred Alternative. As selected, Preferred Alternative 5A does not include any rail or roadway improvements (including no modifications to existing at-grade crossing treatments) between Vaughan Road (Archie Cannon Drive) and Ashcake Road under the DC2RVA Project. College Avenue/Henry Clay Street will remain open with no proposed changes under the DC2RVA Project and the Preferred Alternative will not require the prolonged closure of or any impact to Center Street.

5. **Concern over access of specific crossings**
    a. **In the Northern Virginia Area, there is no reference to problems at Railroad Avenue in Woodbridge. If a new 2-track bridge is to be built east of the existing bridge at Occoquan Creek, what will happen to access to houses on Railroad Avenue? The properties have no legal access to a public road except by using Railroad Avenue, which belongs to CSXT. There should be a frontage road study, with pedestrian passage.**
    b. **In Ashland, what is the plan for the Gwathmey Church Road crossing, which serves a landlocked community? As rail traffic increases, the safety of the crossing will become more of a problem.**
    c. **In Ashland along the western bypass (Build Alternatives 5C and 5C-Ashcake in the Draft EIS), there are families who presently gain ingress and egress from Cross Road. With the rail corridor replacing Cross Road, what happens to property owners in this area?**

In response to a), access to the existing homes along Railroad Avenue in Woodbridge, which parallels the existing tracks and is within CSXT right-of-way, is an ongoing issue that predates the DC2RVA Project. These houses currently use Railroad Avenue, an unpaved CSXT service access road to access an adjacent private residential development and then to a public road. While the use of Railroad Avenue to provide access to the homes has been ongoing for many years, it is not clear if a formal easement exists. The lack of clear access to a public road has created issues for the homeowners and limits re-sale of the homes. Prince William County is currently working with VDOT, the adjacent residential developer, and CSXT to address the existing access situation.

The Preferred Alternative in Area 2 (Northern Virginia) is largely within existing CSXT right-of-way, which includes and impacts the current use of Railroad Avenue. The potential impacts and limits of disturbance on Railroad Avenue are described in the Draft EIS in Section 4.11 and its

Appendix D; updated limits of disturbance are presented in the Final EIS Section 5.11.3 and its Appendix M. Railroad Avenue impacts, which are based on the conceptual engineering that was performed in support of the Draft and Final EIS, will require an alternate form of access to the properties currently served by Railroad Avenue. In accordance with the policies and procedures of VDOT, DRPT will develop plans for Railroad Avenue to provide the information needed to assess the feasibility of providing a frontage road or alternate access at the time that funding is provided for the further development of this portion of the corridor. Those plans would include pedestrian activities noted at the time the plans are developed. DRPT will seek to minimize impacts to property and access during final design throughout the corridor.

In response to b), under the Preferred Alternative, the Project will install four-quadrant gates at the Gwathmey Church Road crossing, which will provide an additional level of safety beyond existing conditions. Two gates will close the crossing to approaching highway vehicles, as in existing conditions; however, an additional two gates will close the crossing behind departing highway vehicles to act as a deterrent to drivers tempted to go between two lowered gates.

DRPT did consider crossing elimination (grade separation or closure with alternate access to Ashcake Road) at this location during preliminary analyses performed in support of the Draft EIS, which are provided in the At-Grade Crossing Evaluation Technical Memorandum (see Appendix OO of the Alternatives Technical Report (Appendix A of the Draft EIS)). However, DRPT determined that grade separation was not feasible due to cost-benefit considerations and the fact that closure with construction of a new connector roadway was not feasible due to property impacts to the residences on Gwathmey Church Road and safety of new intersection geometrics with proposed grade-separated Ashcake Road.

In response to c), Alternative 5A: Two Tracks Through Town has been selected as the Preferred Alternative for Alternative Area 5, which dismisses the western bypass alternatives and the associated impacts noted in the comment. Notwithstanding, as discussed in the Draft EIS, none of the bypass alternatives would have created any new at-grade crossings, and ingress/egress for all residences would have either be maintained, or the entire property would have needed to be acquired.

RIGHT-OF-WAY / DISPLACEMENTS / PROPERTY VALUE

1. Concern about process for acquiring private property, including compensation, timing, need, and methods

In order to minimize impacts to the built and natural environments and in accordance with decisions reached as part of the 2002 Tier I EIS, the DC2RVA Build Alternatives were designed to remain as much as possible within the existing CSXT right-of-way. Additional right-of-way is only required when this could not occur due to safety and/or operations of the Project.

In the Commonwealth of Virginia, the right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, is the responsibility of VDOT. VDOT will ensure the right-of-way process is undertaken in compliance with applicable Federal and state regulations, including the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (URA), as amended. The statutes ensure that the citizens of the Commonwealth affected by the right-of-way process are treated fairly and equitably. VDOT is granted the authority to ensure that right-of-way is acquired at fair market value. VDOT Right-of-Way and Utilities Division adheres to the code of Ethics of the International Right-of-Way association, which includes a commitment "To ascertain and weigh all of the facts relative to real properties in making an appraisal thereof, using the best and most approved methods of determining the just and fair market value." Relocations associated with the Preferred Alternative are discussed in Section 5.11 of the Final EIS. For the improvements proposed in the Preferred Alternative, DRPT (or sponsoring agency) will coordinate all requirements of the right-of-way process through VDOT.

2. **How are farms addressed in the property evaluations of the Draft EIS? Are farms considered businesses?**

Farms are considered a business or commercial relocation and therefore fall under the URA, as described in Right-of-Way response #1 above. Commercial relocations, which includes farms, are addressed in Section 5.11 of the Final EIS.

The right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, is the responsibility of VDOT, in accordance with this Federal regulation, as well as other applicable Federal and state regulations. Additionally, farmland loss and farmland soil acreage loss are both considered as a part of the Farmland Protection Policy Act of 1981 (FPPA) compliance process and are used in the Natural Resources Conservation Service (NRCS) Form CPA-106. These effects are discussed in Section 4.3 of the Draft EIS.

3. **It seems that people with property the railroad crosses would only be compensated for the actual amount of land used by the physical railroad, with no value given to a single property that is split into pieces by the Project, such as a farm with a barn on one side and a pasture on the other.**

Right-of-way and relocations for each of the Build Alternatives are discussed in Section 4.11.4 of the Draft EIS; those associated with the Preferred Alternative are presented in Section 5.11.4 of the Final EIS. Total or partial acquisition of parcels will take place throughout the corridor. The right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, is the responsibility of VDOT, in accordance with Federal and state regulations. Under these regulations, a remnant or residue of a parcel that "can no longer be utilized for the purpose for which the entire tract is then being utilized" could be acquired as a part of the relocation process. In addition, a parcel could also be acquired if the construction of the Project would "leave the remaining portions without a means of access to a public highway."

4. **Concern about property values**
   a. **Since the Project might not be completed until 15—20 years from now, this Project would encumber property owners land by basically tying their hands in the ability to utilize their property rights, and the value of their property would be devalued.**
   b. **In the Ashland Area, concern that the impact on property values of the proposed Project is immediate. Even just the discussion of shutting down Center Street for 2—3 years is hurting real estate prices now.**

In response to a), the Draft EIS examined the direct effects of the Project on property in Section 4.11 those associated with the Preferred Alternative are presented in Section 5.11of the Final EIS. The right-of-way process is highly controlled by various laws and regulations. Compliance is required with most of the substantial body of law that governs private real estate transactions. Preliminary right-of-way estimates are based not only on an individual property but also on similar properties throughout the surrounding area in order to provide a true fair market value of a property. The appraisal describes the property as it exists before the acquisition and without considering the impact of any proposed transportation improvements.

The cost estimates prepared for the Final EIS included all acquisition costs, including land, improvements (e.g. buildings), damages to the property, and relocation expenses for homeowners/renters. These estimates also include administrative costs of acquisition, condemnation costs, demolition costs, and any additional relocation assistance, or utility adjustments, as necessary.

In response to b), subsequent to the publication of the Draft EIS, the Preferred Alternative for the Ashland area was selected as Alternative 5A: Two Tracks Through Town. The corridor through downtown Ashland will remain two tracks and does not require any prolonged closure of or impact to Center Street. Notwithstanding, the economic effects of all Build Alternatives are in Section 4.11.1 of the Draft EIS and associated effects with the Preferred Alternative are in Section 5.11.1 of the Final EIS. Short-term effects are based on construction of the Project. Preliminary right-of-way estimates are based not only on an individual property but also on similar properties throughout the surrounding area in order to provide a true fair market value of a property. The appraisal describes the property as it exists before the acquisition and without considering the impact of any proposed transportation improvements.

5. Concern that impacts to homeowners that are not directly located on the tracks are not considered as part of the Project

The study areas for potential direct environmental impacts extended beyond the properties located directly adjacent to the railroad tracks. For example, as indicated in the introduction to Final EIS Chapter 5, study areas for each potentially affected environmental resource were identified. The study areas differ in size depending on the resource and are typically centered about the existing rail or potential bypass alignments. The study areas for the human environment, noise, and air quality are larger than the natural environment boundaries. The larger study areas are defined by regions of influence in which a resource may potentially have noticeable Project-related impacts. Regions of influence for human resources account for factors such as community sizes, geographical and political boundaries, and census tract boundaries. The study area widths range from 500 feet to up to 3 miles in some sections.

The indirect and cumulative impacts analysis considered areas even farther beyond properties adjacent to the railroad, as outlined for the Preferred Alternative in Final EIS Section 5.20.

6. **Concern that the Draft EIS did not address the economic impact in the Ashland Area**
    a. **In the Ashland Area, concern about negative economic impact of the construction of alternatives through town. The FRA decision will have immediate economic impacts, even if it is scheduled for 15—20 years in the future.**
    b. **In the Ashland Area, the western bypass option will significantly impact taxpaying property owners with lower property values for homes, farms, and land. This negative economic impact will not simply affect the homes and lands in the immediate area of the proposed tracks, but many more homes, farms, and lands in the vicinity of the entire western bypass. These additional taxpaying property owners have not been included in the fact-finding efforts of the rail reports.**

Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland without any impact between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution directing DRPT to avoid or minimize any property acquisitions in downtown Ashland. While this selection negates the comments made regarding the bypass alternatives in Ashland, further response is provided below.

In response to a), the economic effects of all Build Alternatives evaluated in the Draft EIS are presented in Section 4.11.1 of the Draft EIS. The Draft EIS states that "the short-term effects of construction within town [Ashland], particularly central downtown along Railroad Avenue and Center Street, could cause local businesses to suffer loss of commerce and, potentially, closure. In addition to the short-term effects of construction, Build Alternatives 5B, 5B–Ashcake, and 5D–Ashcake could close South Center Street between England Street and Maiden Street. Access to the businesses and residences would still be provided from other public rights-of-way. However, the long-term effects of the closure and change in access could also cause loss of commerce and potential closure of businesses. This in turn could cause negative effects on the economic vitality of downtown Ashland." Commercial relocations for the Preferred Alternative are presented in Section 5.11 of the Final EIS.

In response to b), although it is possible that the Project could have some incremental effects on property values, there is no reliable method to distinguish those incremental effects from other variables that influence values of property over time as part of the NEPA process. Furthermore, in some instances, property values could be affected positively, such as in areas of potential induced development surrounding stations, as indicated in the indirect effects analysis in Draft EIS Section 4.20.1.2.

7. **In the Richmond area, there was no discussion of any potential impacts to local industrial businesses that this Project would affect outside of the Main Street Station Area.**

The Draft EIS addressed a wide range of potential impacts to local industrial businesses (and other land uses) throughout the corridor, for all Build Alternatives, in Chapter 4 as follows: noise and vibration effects are described in Section 4.7; visual impacts are described in Section 4.9; economic effects are described in Section 4.11.1; community effects and effects from changes to the transportation network are described in Section 4.11.2; right-of-way and relocations are identified in Section 4.11.4; and changes in land use are described in Section 4.11.5. In addition, in Section 4.15, the Draft EIS presents changes in regional roadways, the road network near stations, and parking near stations in Section 4.15.1, and proposed crossing improvements effects on connectivity and accessibility (Section 4.15.2). The Final EIS presents updated information on those same topics for the Preferred Alternative; Final EIS Chapter 5 is presented in the same structure as the Draft EIS sections listed above, but each of the numbered sections begins with a 5 (to denote Chapter 5) rather than a 4.

8. **In the Ashland area, it is not clear from the Draft EIS documentation exactly how many houses are impacted by the bypass alignments?**

Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland without any impact between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution on the Project. Preferred Alternative 5A would not impact any homes in Ashland. Notwithstanding, details on the right-of-way and relocations for all alternatives, including the bypass alignments, were discussed in Section 4.11 of the Draft EIS; this information for the Preferred Alternative only is presented in Section 5.11 of the Final EIS.

LAND USE

1. **Lansdowne Road in Spotsylvania County is currently a two-lane facility. The Draft EIS mentions a grade separation where it crosses the tracks near the City of Fredericksburg. The County Comprehensive Plan recommends a future four-lane divided roadway for Lansdowne Road that should be considered as part of this Project.**

Designs in support of the Draft and Final EIS were prepared at a conceptual level sufficient for assessing the impacts of the DC2RVA Project, which is approximately a 10 percent level of design (see the beginning of Chapter 4 of the Final EIS for details). While the expansion of Lansdowne Road to a four-lane facility is in the County's comprehensive plan as a possible improvement by 2030, there are no designs, concept plans, funding, or schedule in place to expand Lansdowne Road. Therefore, the conceptual design for the proposed grade separation of Lansdowne Road over the CSXT right-of-way reflects the two-lane roadway in place as of the completion of the DC2RVA Tier II EIS. Additionally, it is important to note that the Project is not anticipated to affect vehicle volumes or operations on Lansdowne Road. A future expansion of the roadway to four lanes is independent of the DC2RVA Project, and any impacts associated with expanding Lansdowne Road would be a result of that roadway widening project and not the DC2RVA Project. During future phases of design (see Section 7.5 of the Final EIS), DRPT will continue to coordinate with the County to incorporate the comprehensive plan's future roadway improvements in the DC2RVA design plans, as planned and funded at that time.

2. **In Ashland, concern how a bypass would adversely impact Hanover County growth plans and/or is not compatible with County land use plans. For properties along the bypass alignment, houses are zoned for residential, so how can a bypass be built?**

Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland without any impact between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution on the Project. The western bypass alternatives (Alternatives 5C and 5C–Ashcake) were fully evaluated in the Draft EIS. After consideration of the Draft EIS, expanded community engagement of the CAC, and consideration of all of the public comments DRPT did not recommend the bypass alternatives in the Ashland area. Additional discussion and rationale for DRPT's selection of Alternative 5A in Ashland is discussed in Section 4.3.5 of the Final EIS and its Appendix I.

3. **In Ashland, what is the opinion that VDOT has on this western bypass which is in conflict with their planned 4-lane north and western bypass of Ashland (starting at Cross Corner Road and ending at Staples Mills (Route 33))? That study was performed in the early 1990s. Numerous town meetings were held, and the route was chosen either on or very close to existing roadways. How does DRPT propose to close off Cross Corner Road with this West Ashland Bypass and still incorporate VDOT's planned bypass? Does DRPT or FRA have the authority to supersede existing plans by VDOT?**

Although several east and west rail bypass options around the Town of Ashland were considered during the Project alternatives development process, Alternative 5A: Two Tracks Through Town has been selected as the Preferred Alternative. The concept of a roadway bypass of Ashland, studied in the 1990s, is not currently considered an active project by VDOT, and is not listed in VDOT's 2025 State Highway Plan of recommended improvements. The Preferred Alternative will have no effect on the previously studied roadway. Further, VDOT has not offered any objections or concerns regarding the Preferred Alternative and their prior road planning efforts. Two western bypass alternatives (Alternatives 5C and 5C–Ashcake) were evaluated in the Draft EIS. After consideration of the Draft EIS, expanded community engagement of the CAC, and consideration of all of the public comments, DRPT did not recommend the bypass alternatives in the Ashland area as the Preferred Alternative. Additional discussion and rational for DRPT's selection of Alternative 5A in Ashland is discussed in Section 4.3.5 of the Final EIS and its Appendix I.

COMMUNITY FACILITIES / TITLE VI / ENVIRONMENTAL JUSTICE

1. **Concern over Title VI and environmental justice (EJ) populations**
    a. **Will the Project affect more environmental justice (EJ) communities than non-EJ communities? If so, are there viable alternative routes which would have less of an impact on an EJ community and why haven't they been chosen?**
    b. **What specific actions have been taken to ensure that minority and/or low-income communities are not disproportionately affected by the construction and use of high speed rail? How will coordination with these communities be conducted?**

In response to a), the primary effects on Title VI and environmental justice (EJ) populations are through residential relocations. The methodology used to assess the locations of EJ communities and populations as well as the analysis of the effects of the Build Alternatives in the Community Impact Assessment and Draft EIS ensure that disproportionate and adverse effects are considered. The number of relocations, changes in community cohesion, relocations of community facilities, changes of access to these facilities, changes in response times for emergency services, and noise and vibration effects are all examined to assess effects. The EJ impacts are then compared to impacts in those census tracts that do not meet the thresholds for EJ populations. While several of the Build Alternatives analyzed in the Draft EIS had EJ impacts (see Section 4.12 of the Draft EIS), the Preferred Alternative does not have the potential to disproportionately impact census tracts with low-income and minority populations through residential relocations (see Section 5.12 of the Final EIS).

In response to b), public outreach has been integral to the Project since the Project kick-off in the Fall of 2014 (see Chapter 6 of the Draft EIS). DRPT launched a dedicated Project website and social media accounts in October 2014. Newspaper and on-line advertising for the Project kick-off and all subsequent public outreach milestones and events were in both English and Spanish. Public outreach has included public meetings, a Project mailing list, newsletters, small group information meetings, and a continued presence on social media (i.e., Project website, Twitter, Facebook). Community coordination and public outreach will continue through these methods during all future phases of the Project.

2. **It is discrimination that the Project does not include roll on / roll off level platforms at all stations.**

This Project is along tracks owned by CSXT for freight train operations, requiring freight train clearance requirements at most stations. Freight train clearance requirements preclude level platforms for passenger service. As a part of the Title VI and ADA compliance for the DC2RVA Project, accommodations for the population with disabilities have been considered throughout the Project development process. Federal regulations (49 CFR Parts 37 and 38) require passenger rail stations to have boarding platforms that are level to the floor of the railcar, wherever it would not be prevented by freight train clearance requirements. Level boarding will be available at the Staples Mill Road Station after station reconstruction. At the other stations, including Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and Richmond Main Street, the platforms are served from tracks that are used by freight trains and, in some cases, VRE commuter trains. These stations will require low-level platforms. See Station Evaluation response #3 for further details.

The DC2RVA Basis of Design Report, Appendix B of the Draft EIS, states that level boarding for mobility-impaired transit users shall be provided by one or more of the following methods: high level platforms, railcar-equipped wheelchair lifts, or wheelchair lifts. This design report also contains details on the new and rebuilt stations and platforms and their compliance with ADA access requirements. At the stations where level-boarding is not permissible, DRPT or Amtrak (or other sponsoring agency) will be required to submit a level-boarding plan to FRA's Office of Civil Rights demonstrating that the proposed method (railcar-equipped lifts, wheelchair lifts, etc.) will meet the objectives of ADA.

3. **Is Long Bridge Park affected by the Project?**

Subsequent to the publication of the Draft EIS, Alternative 1B was selected as the Preferred Alternative in Area 1 to align with the bridge capacity expansion alternatives that are under consideration as part of the separate Long Bridge study (see Section 4.3.1 of the Final EIS for full details). Preferred Alternative 1B will only have temporary impacts to Long Bridge Park on the west side of the existing right-of-way. These impacts are limited to short-term use of park lands during construction and will not affect existing or proposed park activities. The Draft EIS indicated that Build Alternative 1B would have permanent impacts to Long Bridge Park. However, coordination with Arlington County since publication of the Draft EIS has resulted in the elimination of the permanent encroachments upon park lands to the west of the existing right-of-way. These updated impacts are presented in Section 5.14 of the Final EIS, and are reflected in the Final Section 4(f) Evaluation for the Project (which is Chapter 6 of the Final EIS).

4. **Concern that the third rail options through Ashland do not appropriately consider impacts to Randolph-Macon College**

Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution on the Project. Notwithstanding, according to the College's Strategic Plan 2009-2017, college construction activities would be occurring adjacent to the right-of-way, but these are not expected to be affected by the Preferred Alternative or vice versa.

5. **Concern about specific community facilities located along the bypass alignments in Ashland**
   a. **To Independence Christian Church from the Western Bypass alternatives in the Ashland Area (Build Alternative 5C and 5C–Ashcake).**
   b. **To Kiddie Kingdom (a non-profit child care center) from the Western Bypass alternatives in the Ashland Area (Build Alternative 5C and 5C–Ashcake).**

In response to a) and b), the western bypass alternatives as evaluated in the Draft EIS (Build Alternatives 5C and 5C–Ashcake) have been dismissed from consideration in the Final EIS. Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland without any impact between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution on the Project. Preferred Alternative 5A will have no effect on the noted properties.

6. **What is impact to Leesylvania State Park?**

The Preferred Alternative (Build Alternative 2A) traverses through Leesylvania State Park along the existing rail corridor; however, within this area, improvements are contained within the existing CSXT right-of-way. The Preferred Alternative has no temporary or permanent impacts to the Leesylvania State Park lands.

7. **No consideration was made for any individuals with disabilities, who would be impacted by the sound and vibrations from a rail being close to houses along the Ashland Western Bypass alignment.**

The Preferred Alternative 5A: Two Tracks Through Town will have no effect on the noted property nor the occupants. The western bypass alternatives evaluated in the Draft EIS (Build Alternatives 5C and 5C–Ashcake) have been dismissed from consideration in the Final EIS. Notwithstanding, as part of the Draft EIS, DRPT completed assessments of Project-related noise and vibration for each of the Build Alternatives. The assessments used FRA methods and established maximum acceptable Project-related noise and vibration levels. All locations experiencing Project-related noise and vibration levels above this were considered to be impacts as defined by FRA and subject to appropriate mitigations.

FARMLAND

1. **The proposed Project would impact acres of land that are currently farmed. Not only does this mean that farmers would be unable to farm the land, but it could be impossible to leave cattle in pastures split by a train track. Does the Project account for these ramifications?**

The Agricultural Lands analysis was conducted in accordance with applicable Federal and state regulations: the Farmland Protection Policy Act of 1981 (FPPA) and the Local Agricultural and Forestal Districts Act. Effects to farmland soil, active farms, and Agricultural/Forestal Districts appear in Sections 3.3 and 4.3 of the Draft EIS for all Build Alternatives; the potential impacts of the Preferred Alternative on these resources are presented in Section 5.3 of the Final EIS.

The Preferred Alternative does not split any farms or other lands not already divided by the existing rail corridor:

- In Areas 1, 2, 4 and 6, none of the Build Alternatives had the potential to split farm properties. In Area 3, only Build Alternative 3C as evaluated in the Draft EIS had the potential to split farm properties, and this was not selected as the Preferred Alternative (which was selected as Alternative 3B). The western bypass alternatives in Area 5 (Build Alternatives 5C and 5C–Ashcake) were the only Build Alternatives that could potentially split farm properties, and no bypass alignments were selected as the Preferred Alternative. Alternative 5A: Two Tracks Through Town, which has minor encroachments on lands immediately adjacent the railroad right-of-way but does not split or divide any farm properties, was selected as the Preferred Alternative for this area.
- Throughout the corridor, a limited number of private crossings provide some landowners direct access across the tracks; the Project does not affect the number of private crossings (none are created and none are closed as part of the Project). DRPT will coordinate with CSXT and property owners to determine review or confirm means of access to each property during final design. DRPT will work with CSXT and the private crossing owners to install locking gates at each crossing identified for such treatment, which will be determined during the final design of the Project and is subject to FRA approval at the time of that design. These locking gates will not impede the owner’s access to the private crossing, but will provide an additional measure of safety for both vehicles and trains at the crossing.

2. **The Project should uphold the Farmland Protection Act and the Local Agriculture Districts Act quoted in the Draft EIS which were put in place to minimize the conversion of the Commonwealth’s farmland to nonagricultural uses.**

Farmland loss and farmland soil acreage loss are both considered as a part of the Farmland Protection Policy Act of 1981 (FPPA) compliance process and are used in the Natural Resources Conservation Service (NRCS) Form CPA-106. These forms appear in Appendix N of the Draft EIS and are summarized in Section 4.3 of the Draft EIS for all Build Alternatives; summary for the Preferred Alternative is provided in Section 5.3 of the Final EIS. Within Areas 1-4 and Area 6, the Build Alternative as analyzed in the Draft EIS with the lowest score on Form CPA-106 was chosen as the Preferred Alternative (Alternatives 1B, 2A, 3B, and 4A). Within Alternative Area 5 (Ashland/Hanover County), Build Alternatives 5C and 5C–Ashcake would both convert the highest amount of acreage of farmland soils and both have the highest Corridor Assessment Scores of any Build Alternative throughout the Project corridor; however, neither of these alternatives were selected as the Preferred Alternative for the area. Conversely, the Preferred Alternative (5A: Two Tracks through Town) encroaches upon the least amount of farmland soils and does not bisect or divide any of the properties.

Effects to Agricultural/Forestal Districts have been analyzed in compliance with the Local Agricultural and Forestal Districts Act. The Draft EIS was provided to the Agricultural/Forestal District Advisory Committee, Hanover County Board of Supervisors, and Planning Commission to solicit their comments on the Project.

3. **The dairy industry is in peril all on its own. Over the last 15 years dairies in Hanover have diminished and warrant protection.**

Farmland loss, including pasture and grazing land and on-farm investments, and farmland soil acreage loss are all considered as a part of the Farmland Protection Policy Act of 1981 (FPPA) compliance process and are used in the Natural Resources Conservation Service (NRCS) Form CPA-106. These forms appear in Appendix N of the Draft EIS and are summarized in its Section 4.3 for all Build Alternatives; summary for the Preferred Alternative is provided in Section 5.3 of the Final EIS. Within Alternative Area 5 (Ashland/Hanover County), the western bypass alternatives (Build Alternatives 5C and 5C–Ashcake) would both convert the highest amount of acreage of farmland soils and both have the highest Corridor Assessment Scores of any Build Alternative throughout the Project corridor; however, neither of these alternatives were selected as the Preferred Alternative for the area. Conversely, the Preferred Alternative (5A: Two Tracks through Town) encroaches upon the least amount of farmland soils and does not bisect or divide any of the properties.

BICYCLE AND PEDESTRIAN FACILITIES

1. **Concern regarding consideration/accommodation of bicycle and pedestrian facilities**
    a. **It is an oversight that the Project does not include a parallel greenway. The Project corridor should include a multiuse path that connects to trailways that are in place or planned along the corridor, such as the East Coast Greenway.**
    b. **The Draft EIS did not focus enough on bicycle and pedestrian facilities. Bicycle and pedestrian facilities should be considered and accommodated as part of at-grade and/or grade separated crossings.**
    c. **Walking over the tracks is an impediment and impossible for wheelchairs and mobility aids. How does the Project improve these problems?**

The DC2RVA Project addresses bicycle and pedestrian safety at public at-grade crossings along the DC2RVA rail corridor, in keeping with the Project's Basis of Design and applicable FRA, Amtrak, CSXT, and VDOT safety standards.

In response to a), the decision to establish a new greenway is a separate and distinct action from establishing high speed passenger rail service under the NEPA and is not part of the Purpose and Need of the Project. Additionally, the incremental approach called for in the 2002 Tier I EIS dictates utilizing existing rights-of-way as much as possible. Accordingly, the DC2RVA Project corridor runs on right-of-way belonging to CSXT. The CSXT right-of-way is not of sufficient width to support a greenway, nor does CSXT allow recreational use of its rights-of-way. The Project does not preclude a future greenway outside the CSXT right-of-way, should the Commonwealth decide at some point to pursue such a greenway, under a separate project at that time. However, developing a parallel greenway outside the CSXT right-of-way is a major undertaking and would likely require its own unique corridor study and potentially its own NEPA evaluation should federal funds or actions be involved.

In response to b) and c), existing bicycle and pedestrian facilities are proposed to be maintained (provided in-kind, i.e., to the same level of existing treatment) as part of Project improvements. In locations where the Preferred Alternative includes modifications to the railroad or roadway where bicycle/pedestrian access is present or required, the Project will improve at-grade vehicle crossings with crosswalks for bicycle/pedestrian use, and upgrade other bicycle/pedestrian crossings, to ensure compliance with applicable standards, including ADA. This compliance would be required for the entire crossing and not just the side of the crossing closest to the Project track work. If a crossing does not require roadway or railroad modifications as part of the Preferred Alternative, there will be no changes to the existing bicycle and pedestrian facilities at that location. Additional safety measures, including opportunities for additional bicycle and pedestrian accessibility improvements, including new and/or additional ADA-compliant facilities beyond existing levels, will be evaluated during final design in coordination with FRA; refer to Chapter 7 of the Final EIS for an overview of future steps for the Project.

In addition, as part of the CTB's resolution recommending Alternative 5A as the Preferred Alternative for the Ashland/Hanover area, the CTB directed DRPT to explore the need for other safety improvements to pedestrian and vehicle at-grade crossings within the Town of Ashland. Therefore, DRPT is committed to work with the FRA, VDOT, Town of Ashland, Randolph-Macon College, and CSXT to identify safety improvements for pedestrians, bicycles and vehicles crossing the tracks in Ashland that minimize the acquisition of additional right-of-way. DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

Finally, DRPT notes that crossing railroad tracks at any location other than designated crossings is unsafe and is a violation of Virginia code §18.2-159.

2. Will bicycles be allowed/accommodated for on all the new trains? If not, why?

Provisions for luggage and bicycle allowances are under the purview of the operator (Amtrak). Accordingly, the new service that is proposed as part of the DC2RVA Project will be subject to Amtrak's bicycle policies at the time of service. Current Amtrak bicycle policies are summarized below.

Beginning in fall 2015, Amtrak began implementing a new bicycle policy that allows bicyclists to check their bicycles for transport on customized bike racks installed in train cars. The service is available for a fee at stations with checked baggage service. In addition, at stations with checked baggage, passengers may also check bicycles and/or bicycle trailers in a bicycle container, in lieu of a piece of baggage. Bicycle boxes are sold at most staffed locations.

Amtrak also permits passengers to bring aboard folding bicycles in lieu of a piece of carry-on baggage.

3. **Ashland is home to the intersection of Bicycle Routes 1 and 76. The Draft EIS did not consider these trails that would be impacted by all through-town build alternatives.**

These facilities were mentioned in Section 3.15.1.3 of the Draft EIS (Other Regional Transportation Facilities—Bicycle and Pedestrian Facilities On and/or Adjacent to Public Roadways) and are located in the Project corridor beyond just the Town of Ashland. As noted in bicycle/pedestrian facilities response #1, the Project will improve at-grade vehicle crossings with crosswalks for bicycle/pedestrian use, and upgrade other bicycle/pedestrian crossings, in locations where the Preferred Alternative includes modifications to the railroad or roadway.

Bike Routes 1 and 76 are located on the existing public road right-of-way, which are considered for transportation use and which intersect the DC2RVA corridor in the following locations:

- Bike Route 1 crosses the DC2RVA rail corridor on Mills Drive (U.S. 17) in Spotsylvania County and on White Oak Road (VA 218) in Stafford County. Bike Route 1 is impacted and improved by DC2RVA improvements at: Hermitage Road in the City of Richmond; Hungary Road and Purcell Road in Henrico County; Elmont Road, Gwathmey Church Road, Center Street, and Ashcake Road in Hanover County; Mine Road in Spotsylvania County; Leeland Road in Stafford County; and Lorton Road in Fairfax County.
- Bike Route 76 is impacted and improved by DC2RVA improvements at Ashcake Road in Hanover County.

Additionally, as part of the CTB's resolution recommending Alternative 5A (Two Tracks Through Town) as the Preferred Alternative for the Ashland/Hanover area, DRPT is committed to work with the FRA, VDOT, Town of Ashland, Randolph-Macon College, and CSXT to identify safety improvements for all users, including bicyclists, crossing the tracks at-grade in Ashland. DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

CULTURAL RESOURCES

1. **Concern regarding the Main Street Station options in Richmond and their impact on the Shockoe Bottom Area and the cultural resources related to slave trade in the area, including the footprint of the "Burial Ground for Negros," Lumpkins Jail/Devil's Half Acre, and/or the proposed Memorial Park. Concern that impacts to these resources, either individually or as a whole, were not fully considered within the Draft EIS.**

DRPT and FRA fully understand the sensitivity and significance of the Shockoe Bottom area. Studies to record and evaluate archaeological and architectural properties in this area have been ongoing since 2006. Above- and below-ground cultural resources in the Shockoe Bottom area of Richmond are referenced in the Draft EIS, Final EIS, and associated technical reports in a manner consistent with the Virginia Department of Historic Resources (DHR) guidelines on cultural resource studies and per the process set forth in Section 106 of the National Historic Preservation Act of 1966, ensuring that all effects of the proposed undertaking on historic properties were taken into consideration. Due to additional studies and comments by consulting parties, Lumpkins Jail/Devil's Half Acre site and a burial ground to the north of Shockoe Bottom, Graveyard for Free People of Color and Slaves, have been added to the list of historic properties in the APE. In addition, Lumpkins and the "Burial Ground for Negros" are both being considered contributing elements to the Shockoe Valley and Tobacco Row Historic District, and impacts to these sites and the district due to the Project have been evaluated by the DHR. Project plans are taking recorded resources, the proposed Memorial Park boundaries, and the historic role of Shockoe Bottom in the slave trade into consideration during every step of the engineering and evaluation process and every attempt is being made to avoid significant resources. DRPT used DHR guidelines to evaluate the presence of known resources associated with the slave industry. Tools used during the cultural resource evaluation process included overlaying historical maps on modern aerial imagery, detailed map analysis of the proposed Shockoe Bottom Memorial Park relative to Project alternatives, and careful evaluation of ways to avoid and/or limit both physical and visual changes in the area around Main Street Station.

The Project, as designed and evaluated in the Draft and Final EIS, does not impact known boundaries of sites associated with the slave trade. At the request of consulting parties since the Draft EIS, Lumpkins Jail was added as a historic property to the Section 106 analysis as it is within the indirect area of potential effects. However, FRA determined that the Project will have no adverse effect on this resource, and the DHR concurred with this determination.

Although a Richmond Slave District has not been recorded on file at the Virginia Department of Historic Resources, creation of such a district is a recommended future study to be completed by the City or another entity as described in Final EIS Chapter 3. Establishment of boundaries for such a district is included as a mitigation for adverse effects to the Shockoe Valley and Tobacco Row Historic District.

Aiding in determining boundaries for such a district, in tandem with City efforts, is included in the Section 106 Draft Memorandum of Agreement (MOA) as a mitigation stipulation for adverse effects to the Shockoe Valley and Tobacco Row Historic District. Refer to Appendix K of the Final EIS for the MOA; all Section 106 mitigations are also included as Project Commitments in the Final EIS. This approach, as well as close coordination and a robust dialogue on historic properties in the Shockoe Bottom area, has taken place during numerous meetings, telephone calls and emails between DRPT and FRA with DHR as well as other local stakeholders including the City of Richmond, Historic Richmond Foundation, Preservation Virginia, National Trust for Historic Preservation, National Park Service, and the Advisory Council on Historic Preservation.

Alternative 6F (Full Service Staples Mill Road/Main Street Station) has been selected as the Preferred Alternative in Area 6 through Richmond, which provides full service to two stations in Richmond, one serving Downtown Richmond at Main Street Station and a second serving suburban Richmond at Staples Mill Road. Section 4.3.6 of the Final EIS describes the infrastructure improvements proposed near Main Street Station in Area 6. Through review and investigation of historic records, consultation with consulting parties and groups with a vested interest in area history, and in comments received from the public and organizations, DRPT has reduced the facilities proposed for construction at Main Street Station to the minimum infrastructure necessary to deliver the service proposed in the DC2RVA Project. This includes a reduction in the design length of the platforms on the west side of the station to remain south of East Broad Street, and to the minimum width feasible to support the forecasted level of ridership and services provided at the station. The east side platforms will also remain south of East Broad Street. The provision of a two-station alternative in Richmond allows for a distribution of ridership, parking and automobile traffic among the stations. Therefore, this minimizes the infrastructure required and potential impacts associated with Main Street Station. In addition, the Preferred Alternative infrastructure designs rely upon existing piers and platforms to the greatest extent possible to limit disturbance in general and subsurface impacts specifically in this area. Also, a parking deck planned for east of Main Street Station has been removed since the Draft EIS to minimize impacts on archaeological sites and surrounding buildings.

The City of Richmond is currently developing a plan for the development of the Lumpkins Slave Jail archeological site and a future slavery museum. The Mayor's vision is to develop an area plan that will enable the City to protect and honor the history of the area. This plan would not be limited to the jail and burial grounds, but will also include the broader footprint of Shockoe Valley. As conceived by the City, the plan will support the significant public/ private investments that are underway and that have already been made in Shockoe Valley, such as the renovated Main Street Station and 17th Street Farmers Market. The City confirmed this and their general commitment to historic preservation in this area in a letter dated November 1, 2018 (see Appendix E.5 of the Final EIS for a copy of this letter). The final design of the DC2RVA rail improvements will be coordinated with the City of Richmond and the City's Shockoe Bottom area plans.

All maps showing specific archaeological sites in Shockoe Bottom and elsewhere in the DC2RVA Project corridor have been redacted from public report copies to comply with the Archaeological Resources Protection Act (1979), which limits data available to the public to protect sites from looting or other damaging activities. However, these maps were provided to DHR and interested Consulting Parties for consideration; contact DRPT for details.

To the north of Shockoe Bottom, DRPT also recorded and carefully evaluated the Grave Yard for Free People of Color and Slaves (recorded as archaeological site #44HE1203). The site was first recorded in the spring of 2018. Upon recognition of the presence of the site, DRPT worked to minimize the Project's limits of disturbance in this area to avoid the cemetery to the greatest extent possible. In addition, further research was undertaken to better understand the altered landscape of this area, including gathering historic maps, photographs, newspaper articles, and more. Previous studies by VDOT were also examined to understand the stratigraphy at this cemetery. Based on the revised Project parameters and the historic data on the area's development, the DHR concurred that the Project will have no adverse effect on this cemetery from the perspective of Section 106 of the National Historic Preservation Act. Despite this finding, DRPT is committing to complete additional studies in this area prior to commencing construction, including: 1) completion of an extensive landscape analysis to understand the changes in the topography and development over the past 200 years; 2) archaeological testing in any areas where the Project may require excavation in the vicinity of the cemetery; and 3) archaeological monitoring during Project construction. Data on all of the activities completed on this resource were disseminated to consulting parties and interested members of the public on several occasions, including an on-site visit on February 13, 2019, to assure that this data was thoroughly shared. These are included in the Project Commitments, which are included as a preface in the Final EIS document and will become part of the Record of Decision.

Resources in Shockoe Bottom and the Grave Yard for Free People of Color and Slaves were discussed in Chapters 3, 4 and 5 of the Draft EIS and within several reports in its Appendix R (cultural resource technical reports) to assure that these historic places were taken into consideration during Project planning. Section 3.1.4, Chapters 5 and 6, and Appendices D, E, and K of the Final EIS provide additional information on the historical resources in the Shockoe Bottom/Grave Yard for Free People of Color and Slaves area and provide the reader with a greater sense of the historic and cultural context of the area as indicated in the comment. This additional information, along with numerous comments, led to the modification of several proposed improvement elements for Richmond's Main Street Station (refer to both Section 4.3.6 and Appendix J of the Final EIS for discussions of specific infrastructure changes).

2. **Concern regarding the third-rail options through Ashland and their impact on the historic districts / properties, including the potential Berkleytown Historic District. The Section 106 study revealed buildings that are potentially eligible for individual listing. Aren't historic districts and buildings elevated to individual listings supposed to be protected?**

Section 106 is a process designed to assure that historic resources are taken into consideration during project planning and that adverse effects to these resources be mitigated. The law sets forth this process to assure that significant historic properties are part of the project planning process but designation as a historic property does not afford "protection" per se. Only resources that are determined to be National Historic Landmarks should be avoided outright. If it is found that a project will have an adverse effect on a significant resource in some manner (both direct and indirect), the law states that this effect needs to be mitigated. Mitigation could mean minimizing the Project footprint or physical impacts to a property, installing vegetative screening, preparing historical research for public distribution, creating public interpretive signage, and more. The goals are to assure that all impacts are minimized to the greatest extent possible while still achieving the Project's purpose and need and, in some cases, to give history back to a community wherein historic elements are impacted or removed.

Section 106 studies completed as part of the DC2RVA Project included reconnaissance- and intensive-level architectural documentation of resources along the corridor in areas where the Project may have an effect on their character-defining features; refer to Draft EIS Chapters 3, 4, and 5, and Appendices R and U. Follow-up reports and final summary data can be found in Final EIS Chapters 3, 5, and 6 and Appendices D and K.

The Berkleytown Historic District has been determined to be eligible for listing in the NRHP by the DHR. Section 3.1.3 and Chapters 5 and 6 of the Final EIS provide additional information on Berkleytown and other historical resources in the Ashland area. The expanded discussion provides the reader with a better sense of the historic and cultural context of the area as indicated in the comment.

The FRA has determined that the Preferred Alternative (5A: Two Tracks Through Town) will have an adverse effect on this Berkleytown Historic District as the Project requires notable road modifications at Vaughan Road, thus changing the road pattern of the historic district and installing a new overpass within the viewshed. Berkleytown has been included in the Section 106 Draft Memorandum of Agreement to outline steps to mitigate the adverse effects (see Appendix K of the Final EIS).

The FRA determined that the Project will not adversely affect any other eligible historic property in Ashland due to the minimization of the Project design. The DHR concurred with these determinations (see Appendix E of the Final EIS for details on all Section 106 comments and coordination).

3. In the Ashland Area, how did cultural resources studies along the bypass alignment differ from those along the main corridor through Ashland? Have any studies been conducted on any potential structural changes that may occur to these properties due to additional freight and passenger rail trains?

The Ashland Bypass alternatives (5C and 5C–Ashcake) and the Ashland Through Town alternatives (5A, 5A–Ashcake, 5B, 5B–Ashcake, and 5D) were studied at different levels at the recommendation of the DHR. Because numerous alternatives overlapped in this area, the extant main line (through town) corridor was surveyed through a cultural resource Phase IB identification-level study. This included documenting recorded above-ground resources over 48 years in age and excavating shovel test pits in select areas to identify archaeological sites. For purposes of the Draft EIS study, DHR chose to have DRPT conduct a Phase IA reconnaissance study rather than a Phase IB identification-level study for the bypass alignment due to the possible width of the bypass corridor and the archaeological best practice to avoid excavations where possible. Should the bypass alternative have been selected as the Preferred Alternative, then an extensive Phase IB identification-level survey, including mapping of all areas that would have been the subject of subsurface archaeological testing through shovel test pits, would have been conducted.

Since the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative for the Ashland Area 5. The cultural resource studies have been completed for the Preferred Alternative, a list of historic properties has been developed, Project effect has been determined on the historic properties, and a Section 106 Draft Memorandum of Agreement (refer to Appendix K of the Final EIS) has been authored to outline steps to mitigate the adverse effects, as applicable. This includes considerations on avoidance and/or mitigation, as possible, on both direct (structural) and indirect (visual, etc.) impacts on any resource that is eligible for or listed on the NRHP.

4. Concern regarding the Rosemont Historic District in Alexandria

DHR has determined that the Rosemont Historic District is eligible for the NRHP. As such, the National Historic Preservation Act of 1966 requires an evaluation of potential impacts on the historic significance and integrity of the neighborhood. DRPT has worked closely with DHR, the City of Alexandria, and other groups to assure that character-defining features of the historic district are taken into consideration during all Project planning and all attempts to avoid and minimize impacts are made. Additional studies on the district have been completed since the publication of the Draft EIS, including expanded surveys to assure that all resources have been identified in the area of potential effects and working with the City of Alexandria on their plans to expand the district boundaries. Additional information is presented in both Section 5.13 of the Final EIS and Appendix D.

5. In Ashland, residents living along the tracks receive tax credits from the state to maintain and preserve historic homes. How will this be impacted by the Project?

DRPT does not anticipate that the Project will have negative impacts on the availability of historic tax credits. Any building that is a contributing resource to a NRHP-eligible or NRHP-listed historic district, or that is individually eligible for the NRHP, is potentially qualified for tax credits. The Ashland Historic District will remain listed on the NRHP regardless of the Project. This ensures that tax credits will remain an option for any property owner who owns a building that contributes to the district. DRPT actually recommended within the DC2RVA studies that several other area districts be eligible for the NRHP, including Berkleytown, Taylorsville, Doswell, and an expansion of Randolph-Macon College. DHR's concurrence with DRPT's recommendation that these other area districts are eligible for the NRHP will potentially open up the tax credit program to many more area property owners with buildings that contribute to the eligible districts.

6. **In Ashland, the Commonwealth has invested in the town itself to preserve its historic character. Any three-track option through town would be at odds with those state-sponsored efforts—how does the document account for this investment?**

The Ashland Historic District is listed on the NRHP. Several individual resources in the district are also eligible for the NRHP. The DRPT continues to work closely with the DHR to evaluate any potential impacts to the area's historic significance, integrity, and character, as required through the National Historic Preservation Act of 1966. This analysis and additional data are presented in both Section 5.13 and Appendices D and E of the Final EIS.

Since the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative for the Ashland Area 5. The Preferred Alternative 5A provides the railroad and roadway infrastructure required to support the railroad operations proposed in the DC2RVA Project without adding an additional track through town. As presented in Chapter 5 of the Final EIS, Alternative 5A is expected to affect zero historic properties in downtown Ashland, as no additional infrastructure would be constructed within the Town of Ashland or outside of the CSXT railroad right-of-way through Hanover County. The exception to this includes the construction of new highway-rail grade separations where Vaughan Road (Archie Cannon Drive) and Ashcake Road cross the corridor to the north and south. There are no historic properties in the area of potential effects at the Ashcake Road intersection. There is one historic resource at the Vaughan Road (Archie Cannon Drive) intersection: the Berkleytown Historic District. The FRA has determined, and the DHR concurred, that the Project will have an adverse effect and a 4(f) use of this resource. Stipulations to mitigate the adverse effect are set forth in the Section 106 Draft Memorandum of Agreement (see Appendix K of the Final EIS for details).

7. **The Draft EIS did not give adequate consideration to the impact on the cultural, archeological, and historic site of Ferry Farm, George Washington's boyhood home. Currently Stafford County is re-configuring the entrance road to this cultural site to align with the Ferry Road and Route 3 (Kings Highway) intersection, which would be directly across from the rail crossing of Ferry Road on the Dahlgren spur (relevant to the 3C option).**

The Fredericksburg Bypass (Build Alternative 3C) was the subject of a Phase IA reconnaissance study rather than a Phase IB identification-level study as part of the Draft EIS process for several reasons, including the width of the bypass corridor and the archaeological best practice to avoid excavations where possible. DRPT and FRA understand that the Phase IA is a planning document only and does not replace the need for a Phase IB identification survey had the bypass alternative been selected. However, the Preferred Alternative 3B (which adds one track east of the existing tracks) will not have any effect on the historic Ferry Farm as it is not located with the area of potential effects of the Preferred Alternative, which bypasses this area and runs through downtown Fredericksburg instead.

NATURAL AND WATER RESOURCES

1. **How will the Project reduce and/or mitigate the effects on the groundwater and private wells throughout the construction and long-term operation of the railways? Will the Project be assessed for its potential to contaminate water supplies under the Safe Water Drinking Act amendments? How will these specific potential sources of pollution be monitored and addressed so that contamination is minimized to the lowest levels possible? Are there measures in place for how to address a contamination episode if one occurs due to the Project? A testing and alert mechanism for contaminated water should be implemented in order to ensure groundwater stays clean and safe for use.**

Section 4.1.4 in the Draft EIS and Section 4.1.4 in the Natural Resources Technical Report describe the extent of involvement of the Project with public groundwater drinking water sources and private wells for all Build Alternatives evaluated in the Draft EIS, and Section 5.1.4 of the Final EIS presents this same information, updated for the Preferred Alternative specifically. Section 5.1.6.3 in the Final EIS identifies a number of impact reduction and mitigation measures to be implemented for the Project. Among these are temporary and permanent stormwater management measures and pollution controls. If accidental spills occur during construction, the contractor will be required to immediately notify all appropriate local, state, and federal agencies and to take immediate action to contain and remove the contaminant. Spills of fuel or other potentially hazardous materials that may occur during operation of proposed passenger trains will be handled in accordance with emergency management and response plans of CSXT, Amtrak, and VRE in coordination with local, state, and federal emergency response agencies as appropriate, depending on the situation; refer to Section 5.18 of the Final EIS, which has been updated since the publication of the Draft EIS, for details on public health and safety with regard to hazardous materials.

Proposed mitigation is identified throughout Chapter 5 of the Final EIS as a way to avoid, minimize, reduce, or eliminate potential effects of the Project, including applicable Best Management Practices (BMPs), which are existing practices and measures required by law, regulation, or policy that reduce the environmental impacts of designated activities, functions, or processes. As detailed in Section 5.1 of the Final EIS, the Project will not remediate existing sources of contaminants unless practical or required by federal, state, or local regulations; however, construction of the Preferred Alternative will incorporate BMPs and improved stormwater facilities, which will mitigate potential impacts and minimize further impairment of the water bodies. Further, the Preferred Alternative will be located adjacent to existing railroad and roadway facilities, and construction of the Preferred Alternative will incorporate BMPs and improved stormwater facilities, which will mitigate the potential impacts caused by the new facilities constructed by the Project and may result in improved water quality conditions.

2. **How will the Project protect flood zones/wetlands or get approval from DEQ to build in these areas? More must be done to absorb the cost of losing wetland ecosystems.**

Efforts have been made throughout the planning and preliminary design process to avoid and reduce impacts to streams and wetlands to the extent practicable, and such impact avoidance and reduction efforts will continue to be made during the Project's final design and permitting, which will occur after funding becomes available and incremental improvements are scheduled. Impacts to streams and wetlands are governed by the federal Clean Water Act, which requires permits from federal and state regulatory agencies. Close coordination has been maintained with the U.S. Army Corps of Engineers and the Virginia Department of Environmental Quality during the course of the DC2RVA Project development process - including scoping meetings, review of DRPT's approach to evaluating wetland and stream impacts, and field reviews. DRPT anticipates the Project will be developed incrementally depending on availability of funding. As funding becomes available, a selected portion of the Project will move into final design and permitting prior to construction. As part of the joint permitting process, mitigation for unavoidable impacts will be developed in coordination with these same regulatory agencies and will be incorporated into final design for both temporary and permanent impacts. An updated mapbook of water resources (major river crossings, streams, wetlands, impaired waters, and resource protection areas) in relation to the Preferred Alternative LOD is provided in Appendix M of the Final EIS. Section 5.1.2 of the Final EIS discusses the impact of the Preferred Alternative on wetlands, and Section 5.1.6.1 presents avoidance, minimization, and mitigation evaluation for water resources. Section 7.8 of the Final EIS discussion permits and regulatory approvals that will be needed for the next steps of the Project design and construction.

The Project is also being designed consistent with Executive Order 11988 and state/local regulations pertaining to floodplains so that the probability of increased flooding is minimized and to avoid or minimize impacts on natural and beneficial floodplain values.

3. **The effects of sea level rise are not considered by the Draft EIS. Currently, there are stretches along the corridor where the water seems to be lapping at the tracks already. That's going to be a growing problem and needs to be addressed.**

A review of Sea Level Rise Planning Maps produced by the Virginia Institute of Marine Science's Center for Coastal Resources Management show that most of the corridor is at elevations that will be well above projected sea level rise. The most vulnerable areas would be in Arlington, Alexandria, Prince William County, and Stafford County, and potential issues posed by rising sea level in these areas include potential flooding, wave attack and erosion of the railroad base, and potential interruptions of service due to damaged infrastructure.

Railroad design standards (as summarized in the DC2RVA Basis of Design, which is Appendix B to the Draft EIS) take into account the risks of flooding, hydrological parameters, and erosion protection. During the final design phase, these standards, as well as any necessary supplemental hydrological studies reflecting potential sea level rise, will be used to design the rail infrastructure to withstand reasonably expected risks associated with potential sea level rise. Refer to Chapter 7 of the Final EIS for an overview of future steps for final design, implementation, and construction of the Project.

4. **Concern over "missed" natural and/or water resources in the Ashland Area along the Western Bypass alternatives (Draft EIS Build Alternatives 5C and 5C–Ashcake)**
   a. **In the Ashland Area, the proposed bypass (Build Alternatives 5C and 5C–Ashcake in the Draft EIS) would kill a Giant Sequoia on the land at 12311 Elmont Road.**
   b. **In the Ashland Area, a property owner along the Western Bypass (Draft EIS Build Alternative 5C and 5C–Ashcake) found a male (red eyed) eastern box turtle. Its roaming radius is approximately 1 mile.**
   c. **In the Ashland Area, property along the Western Bypass (Draft EIS Build Alternative 5C and 5C–Ashcake) has wetlands and flood zone areas. If property owners cannot build in this area, how is it legal to build a train track? The number of trees that will have to be cut and soil that will have to be disturbed will be devastating. The DEQ of VA website seems very clear that it can't happen. These areas are also home to native wildlife such as deer fox owls and eagles, which could become landlocked if the Project is built.**

Subsequent to the publication of the Draft EIS, Alternative 5A: Two Tracks Through Town was selected as the Preferred Alternative and would maintain the existing two-track corridor through downtown Ashland without any impact between Vaughan Road (Archie Cannon Drive) and Ashcake Road, in accordance with the CTB resolution on the Project. Notwithstanding, DRPT has provided responses to each of these concerns, below.

In response to a), the western bypass alternatives (5C and 5C–Ashcake), which could potentially affect the noted tree, are not included as part of the Preferred Alternative evaluated in the Final EIS.

Notwithstanding, as acknowledged in the Draft EIS (page 4-68), construction of the Build Alternatives would affect terrestrial natural communities and associated wildlife habitat through conversion of existing land coverage to railroad structures and maintained right-of-way. Minimization measures to protect natural habitats and communities could involve minimization of clearing and grubbing, landscaping and planting for onsite replacement of trees that are removed, and native shrub planting and reseeding of disturbed areas. Non-native ornamental trees, such as a Giant Sequoia, typically have less value to terrestrial natural communities and wildlife than native trees and shrubs, although such trees can have value to property owners and communities.

In response to b), the western bypass alternatives (Alternatives 5C and 5C–Ashcake), which could potentially affect the noted box turtle habitat, are not included as part of the Preferred Alternative evaluated in the Final EIS.

Notwithstanding, as discussed in Section 4.10.1 of the Draft EIS, the Build Alternatives would affect terrestrial natural communities and associated wildlife habitat through conversion of existing land cover to railroad structures and maintained right-of-way. Box turtle habitat consists of mesic (moist) woodlands, including hardwood (oak-hickory) forests, mixed hardwood-pine forests, and maritime forests (Dodd 2002). As reported in Table 4.10-1 of the Draft EIS, approximately 64.0 acres of permanent impacts and approximately 20.7 acres of temporary impacts to upland forest habitat would occur on the Ashland bypass alignments (Alternatives 5C and 5C–Ashcake). These habitat conversions could be expected to incrementally diminish the resident population of box turtles, if present in the impacted areas, and to present a barrier to box turtle movements. However, box turtles are not on the Virginia or federal lists of threatened or endangered species. According the Virginia Department of Game and Inland Fisheries (VDGIF), the box turtle is known or likely to occur in every county in Virginia (VDGIF website 2017). The box turtle is not included on the Virginia Division of Natural Heritage's Rare Animals List, Animal Watchlist, or Animal Review List (Roble 2016).

In response to c), the western bypass alternatives (5C and 5C–Ashcake), which could potentially affect the noted wetlands, are not included as part of the Preferred Alternative evaluated in the Final EIS.

Notwithstanding, it would be legal to build railroad tracks within wetlands and floodplains provided applicable permits are obtained from the U.S. Army Corps of Engineers, the Virginia Department of Environmental Quality, and the Virginia Marine Resources Commission. Before issuing such permits, permitting agencies require applicants to document efforts to avoid and minimize impacts to these resources to the extent practicable. In addition, compensatory mitigation must be provided to offset unavoidable impacts.

5. **As our region and state see more traffic, investment in Long Bridge across the Potomac is a critical component to handle growth in Amtrak and VRE and freight. All that construction must meet high standards for sediment and erosion control and long-term stormwater management.**

DRPT and FRA agree that additional capacity across the Potomac River at or adjacent to the Long Bridge is critical to handle growth in passenger, commuter, and freight rail service, and the DC2RVA Project has included the expanded capacity over the Long Bridge as part of the infrastructure that would be in place under the No-Build Alternative in both the Draft and Final EIS. Separate from the DC2RVA Project, DRPT is working with District Department of Transportation (DDOT) and other stakeholders on an EIS for the Long Bridge Project, which proposes to increase rail capacity at the Long Bridge Potomac River rail crossing. Any impacts associated with the proposed expansion of the Long Bridge are accounted for (quantified and mitigated, as necessary) as part of that project, separate from the DC2RVA Project.

Comprehensive sediment and erosion controls will be implemented on a temporary basis during construction and on a long-term basis for the life of the DC2RVA Project. Similar controls would also be expected to be employed under the Long Bridge Project, as defined in its separate EIS record. Applicable standards require controls aimed at both water quality and quantity. Refer to Section 7.8 of the Final EIS for summary of regulatory actions and approvals that will be required as the Project moves forward.

6. **What is the plan for design of bridge openings over navigable waterways, including Neabsco Creek?**

Bridge openings over navigable channels are regulated by the U.S. Coast Guard (USCG), which typically requires existing navigable channels to be maintained. Specifically, in response to Neabsco Creek, information available to DRPT at the time of this study indicates that the USCG will require a minimum navigable channel opening width of 30 feet for a new structure at the crossing. Final designs for the new bridge will meet the USCG permit requirements at that time.

NOISE AND VIBRATION

1. **Concern about what noise and /or vibration studies have been conducted as part of the Project**
    a. **How will noise and vibration of high speed rail compare to current Amtrak, CSXT, and commuter trains?**
    b. **Noise and vibration levels were not studied for all traffic that would travel on new line such as freight and other passenger trains.**
    c. **The effects of increased weight from heavier and longer trains and the increases in the future were not considered, nor is the closer distance about 15 feet considered.**
    d. **What about impacts due to existing trains or when existing trains pass by each other? This Project will increase the ability of other trains to move more quickly. What would the vibration and noise impacts be of increased speeds of these other trains?**
    e. **The noise impact assessment failed to assess and compare current noise exposure versus projected future in terms of length of time of exposure and any increases in decibels.**
    f. **Concern over impact to underground pipelines within the railroad easement, especially since some of these may be very old and not withstand increased vibrations from the Project.**

DRPT completed noise and vibration studies for all Build Alternatives that were considered in the Draft EIS, including bypass alignments (Fredericksburg and Ashland), from which the Preferred Alternative evaluated in the Final EIS was chosen. FRA has established maximum acceptable Project-related noise and vibration levels. Noise and vibration levels due to the proposed Project that are above these maximum acceptable levels are considered to be impacts as defined by FRA. Train noise level calculations accounted for Project-related wayside noise (locomotive and wheel-rail noise) and locomotive horn use at public at-grade crossings. Existing locomotive horn use is incorporated into the noise analysis via the existing noise measurements. FRA locomotive horn use regulations and CSXT operating rules do not require locomotive horn use at private at-grade crossings. Further, CSXT has a rule on train horn use such that trains should not sound horns at any passenger and commuter station on the corridor between the hours of 11:30 pm and 4:30 am unless people are present. The train noise evaluated by DRPT, following FRA guidelines, combines the wayside train noise from the passage of the locomotive and rail cars and the train horn noise at crossings and stations. The vibration assessment also followed precedent recently established by the Richmond to Raleigh (R2R) EIS, which was also approved by FRA. DRPT completed assessments of Project-related noise and vibration using FRA methods, which included measuring existing noise levels throughout the corridor and along the bypass routes. DRPT also measured existing vibration levels. Results of the noise and vibration assessments are summarized in the Draft EIS and presented in greater detail in its Appendix P (Noise and Vibration Technical Report). Section 5.7 of the Final EIS presents the noise and vibration impacts for the Preferred Alternative, and includes discussion of the minor changes that have occurred since the publication of the Draft EIS. Figures in the Noise and Vibration Technical Report (Appendix P of the Draft EIS) showed the noise and vibration impact contours for the Build Alternatives evaluated in the Draft EIS, which have not changed for the Preferred Alternative other than in two locations for noise only in the Project corridor (these locations are in Area 2 and Area 6 and are updated in Appendix M of the Final EIS).

In addition, see below for details for each of the questions asked above.

In response to a), the intercity passenger trains proposed under this Project are anticipated to utilize locomotives and railcars that are similar to locomotives and railcars currently used by passenger trains in the corridor. Therefore, DRPT anticipates that noise and vibration from the proposed trains will be similar to noise and vibration from existing passenger trains when the speeds are the same. Train noise and vibration generally increase as speed increases, however, duration of the noise and vibration event decreases.

In response to b) and c), DRPT evaluated noise and vibration associated with the addition of 9 new daily intercity passenger round trips (18 total trains per day) on the DC2RVA corridor, using FRA methods for noise and vibration impact assessment. The most common source of noise and vibration in the study area is freight trains, generally produce higher levels (or more) noise and vibration than passenger trains because they are heavier and longer. Freight trains operate and may increase or decrease independently of the proposed DC2RVA Project and, and in some sections of the corridor may operate more frequently or during evening/late night hours when noise may be more noticeable. Potential changes in freight and passenger train traffic currently utilizing the Project corridor that would occur independent of the proposed Project are not included in the noise or vibration assessment performed for this Project. CSXT's potential use of longer and heavier freight trains was not evaluated in the noise and vibration assessment.

In response to d), in accordance with the requirements of NEPA and the noise and vibration assessment guidelines of the FRA, DRPT assessed noise and vibration due to the 9 new daily intercity passenger round trips (18 total trains per day) and did not separately evaluate noise and vibration from passenger or freight trains that currently use the corridor except where the DC2RVA Project proposes to install the new tracks and realign the existing tracks on a shifted location, which would bring the tracks closer to or shift them farther from noise receptors (i.e., closer to or farther away from a home or school.).Also, the Preferred Alternative has the potential to reduce existing horn noise through the seven new grade separations and seven crossing closures proposed for existing at-grade crossings in the corridor (refer to Section 5.15.2 of the Final EIS for specific locations of at-grade crossing treatments for the Preferred Alternative).

If two of the proposed intercity passenger trains happened to pass each other while traveling in opposite directions at the same speed, it is possible that vibration levels could increase up to 3 vibration decibels (VdB) at the moment and place of passing. However, it is difficult to project where along the corridor such a passing event may occur. Vibration levels from simultaneous pass-by events are subject to the same FRA vibration impact thresholds as single passenger trains are subject to, however, evaluating vibration from identical trains passing at the same speed, in the same location, is highly variable and beyond the scope of FRA vibration assessment requirements.

In response to e), DRPT's noise analysis is based on the land use category and the projected change to the existing noise exposure in the area. In accordance with FRA noise impact assessment guidelines, DRPT measured existing noise levels at locations throughout the corridor, calculated future Project-related noise levels, and compared those results with FRA noise impact thresholds. The thresholds are based on specific noise-sensitive land categories: "no impact" indicates Project noise levels are unlikely to cause annoyance; a" moderate noise impact" is a noise level increase that is noticeable to most people, yet generally not enough to cause adverse reactions; and a "severe noise impact" is a noise level increase that could cause annoyance to a significant percentage of people. The FRA noise impact assessment methods base the noise impact threshold on existing noise levels; in that manner, existing noise levels are incorporated into the noise assessment. DRPT's assessment accounted for the length of the proposed intercity passenger trains and their speed, as well as new tracks and track shifts.

In response to f), pipelines and other in-ground utilities do occur within or along portions of the CSXT-owned right-of-way. For the purposes of assessing potential Project impacts and estimating Project costs within the Draft and Final EIS, DRPT has assumed that where the permanent limits of disturbance associated with Project improvements encroach upon these utilities, the utility would be relocated. Utility relocations would be subject to existing easement agreements between the utility and property owner; subject to the nature of the cause of the relocation (DC2RVA Project related or tertiary); and subject to the cause of the action (dependent upon who is initiating and funding the work – private party, property owner, utility owner, or public entity).

Project improvements have been designed to a conceptual (10% design) level. The impact limits and location of the utilities is based on readily available geospatial data. That utility data does not provide pipeline conditions or other information necessary to reach a more detailed conclusion. As the Project advances through future design phases, DRPT will coordinate with CSXT and the utility owners/operators to address potential impacts (ballast encroachment, vibration, maintenance access, etc.) to the utility. Possible measures to address utility impacts include design modifications to the Project, design modifications to the utility, and/or relocation of the utility.

2. **Concern about noise and vibration mitigation**
    a. **What noise and vibration mitigations are occurring? Residences already have noise impacts and/or shaking of homes when the trains go past, which will get worse with the addition of new rails. Can an impact study and/or mitigation (natural and/or manmade, i.e., noise barriers) be completed? Are you going to pay for damage that the Project does to homes shaking?**
    b. **Concern that Draft EIS does not detail mitigation. When will residents know whether the severely impacted residential areas will be looked at for noise barriers? Will mitigation include sound walls and/or requests for sound walls?**

The Final EIS presents preliminary avoidance, minimization, and mitigation measures for noise and vibration in Section 5.7.1.3 and 5.7.2.3, respectively.

In response to a), DRPT is aware that some residents living near the existing alignment report being able to feel vibration during train pass-by events. It is possible that freight trains produce the highest levels of ground-borne vibration, and that some of the perceived vibrations are actually the result of airborne low frequency noise emitted by diesel locomotives on freight trains.

The FRA has established maximum acceptable Project-related noise and vibration levels. Noise and vibration levels above this, due to the proposed Project are considered to be impacts as defined by FRA. DRPT completed assessments of Project-related noise and vibration using FRA methods. Results of those assessments are summarized in the Draft EIS and presented in greater detail in its Appendix P (Noise and Vibration Technical Report). Section 5.7 of the Final EIS presents the noise and vibration impacts for the Preferred Alternative, and includes discussion of the minor changes that have occurred since the publication of the Draft EIS. Figures in the Noise and Vibration Technical Report (Appendix P of the Draft EIS) showed the noise and vibration impact contours for the Build Alternatives evaluated in the Draft EIS, which have not changed for the Preferred Alternative other than in two locations for noise only in the Project corridor (these locations are updated in Appendix M of the Final EIS).

In response to b), mitigation measures will be evaluated in more detail during final design, which will occur after funding becomes available and incremental improvements are scheduled. Mitigation measures for noise impacts from the additional 9 new daily intercity passenger round trips (18 total trains per day) will be evaluated where warranted. Train noise (other than whistle noise at crossings; refer to response #7 below) is difficult to mitigate without creating additional impacts to property and the environment. The process of evaluating and implementing noise and vibration mitigation will occur in accordance with FRA methods and guidelines and subject to FRA approval.

While sound barrier walls are a common mitigation measure for major highway projects, they are not typical for intercity passenger rail projects and are not required by FRA or FTA. Further, CSXT policy generally does not allow sound barrier walls within their right-of-way. Therefore, use of sound barrier walls as future mitigation for DC2RVA train noise would require additional property impacts.

3. **Concern about noise and vibration during construction, which doesn't seem to be evaluated in the Draft EIS**

DRPT evaluated construction noise and vibration; refer to Section 4.19 of the Draft EIS for all Build Alternatives, and Section 5.19 of the Final EIS for the Preferred Alternative specifically.

4. **The noise and vibrational impact section of the Draft EIS falls far short of describing, if not actively disguises, the increased vibrational and noise impact that another set of tracks and the resulting increased high speed train and freight traffic will have on the livability of the surrounding neighborhoods. The report fails to note that some homes are all built on marine clay. This is in contrast to what the report says, which states that the soil on which the tracks are built minimally conducts vibration or noise. The Project should mandate slow moving trains and lighter trains and enforce these regulations.**

DRPT adequately and appropriately evaluated noise and vibration from the proposed intercity passenger trains using FRA methods and guidelines. Vibration effects were assessed based on the methods and criteria included in FRA's High Speed Ground Transportation Noise and Vibration Impact Assessment guidance manual (September 2012) as well as those included in the FTA's Transit Noise and Vibration Impact Assessment (May 2006) manual, where applicable.

Vibration is evaluated on a per-event basis, not on a cumulative or 24-hour basis; noise is evaluated on a 24-hour cumulative basis. The Project proposes to add intercity passenger trains, which are lighter than freight trains and therefore do not produce the same levels of ground-borne vibration as freight trains operating at the same speed. Freight trains operate as-needed in response to market demands, and independently of this Project. This Project does not propose to change the consist (e.g. type and order of rail cars in a train) or volume of freight trains in the Project corridor. Reducing the speed of passenger trains in the corridor conflicts with the Purpose and Need for the Project.

DRPT reviewed publicly available and reasonably obtainable soils data in the study area in an attempt to assess their ability to propagate ground-borne vibration. Due to the magnitude of the Project corridor, DRPT developed general characterizations of the soil's vibration propagation characteristics for each segment of the corridor evaluated in the vibration analysis and incorporated those characterizations into the vibration assessment for each Project segment.

5. **If adequate engineering studies had been done, the conclusion would be that many of the historic homes along the corridor would not be able to withstand the construction / drilling impact that will occur because of the Project.**

DRPT performed a preliminary evaluation of construction-related vibration using FRA guidelines. The construction vibration assessment performed at this phase of this Project did evaluate the potential for vibration-induced damage to buildings during construction; see Draft EIS Appendix P—Noise and Vibration Technical Report for full details, and Section 5.7.2 of the Final EIS for vibration impacts of the Preferred Alternative. A more detailed construction vibration assessment will be performed as-needed during the final design phase of the Project.

6. **Why has no one has done a noise and vibration study on any of the houses on Mount Vernon Avenue near King Street Metro? Due to the proximity of these houses to the tracks, such a study should have been a priority for this EIS to be taken seriously.**

DRPT evaluated noise and vibration throughout the entire 123-mile study corridor using FRA methods for noise and vibration impact assessment, which are the appropriate methodologies for this type of Project. This evaluation included measuring noise throughout the study area, measuring vibration at select locations, and calculating Project-related noise and vibration throughout the entire study corridor. These findings for all Build Alternatives are summarized in Section 4.7 of the Draft EIS, and in Section 5.7 of the Final EIS for the Preferred Alternative. Specific areas projected to experience noise and vibration impacts as defined by FRA are identified in the contour figures presented in Draft EIS Appendix P—Noise and Vibration Technical Report; changes in noise and vibration impacts from the Draft EIS to the Final EIS due to minor design changes are presented in Section 5.7 of the Final EIS.

7. **Concern about train horn use**
    a. **There are existing quiet zones in the corridor to prevent the trains from blowing horns. The Project should establish new quiet zones in other areas throughout the corridor?**
    b. **Will the Project significantly decrease frequency and decibels of train horns?**
    c. **The process for evaluating locomotive air horn noise in Crystal City and Alexandria is flawed. 110 decibels is in the Code of Federal Regulations, but that level of air horn noise is an issue.**

In response to a), quiet zones are addressed in Section 5.15 of the Final EIS. FRA regulations (49 CFR Part 222) requires locomotive horn use at public at-grade crossings, but the regulations also include the procedures by which the local authority could establish a quiet zone where locomotive horn use at public at-grade crossings is not necessarily required because supplemental and alternative safety measures (SSMs) are installed. Under the regulations, local jurisdictions/municipalities initiate and manage the process for implementing the creation of new quiet zones; it is not under the purview of DRPT nor this Project. Therefore, noise reduction benefits that would derive from removing the requirement for trains to routinely sound horns are dependent on locality actions, in accordance with FRA standards and approved by FRA. Also, CSXT operating rules require all trains to sound their horn when approaching, passing, or departing a passenger (intercity or commuter) station along the mainline. Localities would also fund all improvements, equipment, and signage, and they would provide ongoing maintenance for all quiet zones within their jurisdictions. The FRA Office of Railroad Safety authorizes quiet zones on a site-specific basis, which are voluntary by the operating railroad.

DRPT does not anticipate that the Project will adversely affect existing or future quiet zone designations as Project improvements that qualify as SSMs are proposed at most existing public at-grade crossings, including the two areas with existing Quiet Zone designations (see Section 5.15.2.2 of the Final EIS).

In response to b), use of locomotive horns and how loud they have to be are regulated by FRA safety rules, and are also subject to CSXT operating rules. This Project does not propose to decrease the loudness of locomotive horns; however, the Project does include the elimination of several at-grade crossings by either grade separating the crossing or closing the crossing. In these locations, the elimination of at-grade crossings would decrease horn noise.

In response to c), locomotive horn use is regulated by FRA safety regulations, and also subject to CSXT operating rules. DRPT evaluated locomotive horn use by the proposed intercity passenger trains implemented under the DC2RVA Project using FRA noise assessment methodologies.

AIR QUALITY

1. **The Draft EIS doesn't seem to reflect the reduction in highway emissions that could occur if more people chose to travel by rail.**

DRPT evaluated the potential reduction in highway pollutant emissions in the Draft EIS. This information was presented for all Build Alternatives in Section 4.6.4 and Table 4.6-3 of the Draft EIS; updated impacts for the Preferred Alternative are presented in Section 5.6.4 and Table 5.6-3 of the Final EIS. DRPT estimates that the Preferred Alternative will reduce carbon dioxide (CO2) 6,518 tons per year by 2045. This calculation includes all modes of intercity passenger travel between Washington, D.C. and Richmond, VA (i.e., rail, automobile, bus, and air). CO2 is the primary greenhouse gas (GHG) associated with the combustion of transportation fuels, accounting for more than 95 percent of transportation GHG emissions based on global warming potential.

Additionally, DRPT estimated the Project will result in a net reduction in fuel consumption in the DC2RVA corridor of approximately 3 million gallons per year by 2045; refer to Section 4.6.2.1 of the Draft EIS and Section 5.6.2.1 of the Final EIS. Reducing fuel consumption will result in a commensurate reduction in pollutant emissions.

2. **Increased train traffic from the Project will cause an environmental burden on the people living next to the tracks because of the additional diesel fumes and related emissions which impact the air quality, which was not addressed in the Draft EIS.**

Section 4.6 of the Draft EIS addressed air quality impacts of all Project Build Alternatives, and Section 5.6 of the Final EIS addresses the same topic for the Preferred Alternative. While the Project would increase the emissions of diesel exhaust and associated directly-emitted air pollutants along the DC2RVA corridor, the spatial and temporal density of these emissions would not be nearly sufficient to cause or substantially contribute to localized violation of the National Ambient Air Quality Standards (NAAQS). Additionally, the Project will decrease intercity passenger regional vehicle miles traveled (VMT) and mobile source air toxics (MSAT) emissions compared to the No Build Alternative. The availability of improved intercity passenger rail service would reduce the number of vehicle trips on a regional basis. Because the Project will not substantially change the regional traffic mix, the amount of MSATs emitted from highways and other roadways within the study area would be proportional to the VMT. Because the regional VMT estimated for the Project would be less than the No Build Alternative, MSAT emissions from regional vehicle traffic would be less for the Project compared to the No Build Alternative.

3. **There is no consideration given to air quality during construction in the Draft EIS. There will be fumes and noises coming from construction that it will be unhealthy to residents and their posterity.**

Since the publication of the Draft EIS, DRPT has conducted a quantitative assessment of greenhouse gas (GHG) emissions during construction for the Preferred Alternative using the FHWA Infrastructure Carbon Estimator (see Section 5.6.5 of the Final EIS for details). DRPT determined that CO_2 emissions from DC2RVA construction will be less than 0.1 percent of the total CO_2 emissions from large facilities in the DC2RVA study area. Given this relatively small contribution, its distribution along the 123-mile corridor, and emission across multiple years, DRPT concludes that construction of this Project will have a negligible impact on climate change due to GHG emissions.

All construction activities will be performed in accordance with VDOT's Road and Bridge Specifications on fugitive dust control, which would be incorporated into the contract specifications at the time of construction. With the application of appropriate measures to limit dust emissions during construction, DRPT does not anticipate that this Project will cause any significant, short-term particulate matter air quality impacts.

VISUAL / AESTHETIC

1. **How are visual impacts evaluated, both throughout the corridor and within historic downtown Ashland streetscape specifically?**

Aesthetic and visual impact methodology are addressed in Section 4.9 of the Draft EIS, and the visual impacts related to the Preferred Alternative are presented in Section 5.9 of the Final EIS. In accordance with FRA's Procedures for Considering Environmental Impacts (FRA 1999), DRPT identified major changes likely to occur in the natural landscape and in the developed environment as a result of this Project. The assessment considered the visual changes associated with the Build Alternatives, such as track improvements, bridges, grade crossings/separations, roadway improvements, stations and maintenance facilities, and other permanent improvements associated with the Project. The level of visual impact was assessed by combining the severity of the change in visual quality with the degree to which people are sensitive to the change.

The visually sensitive nature of the Town of Ashland is recognized by DRPT. The Preferred Alternative 5A: Two Tracks Through Town will introduce minimal changes to the visual context of the historic downtown area. The two existing tracks will remain in their current location and no new trackage will be constructed. Further, there would be no changes to the existing station location or infrastructure under the DC2RVA Project. Grade separated structures will be constructed at Vaughan Road (Archie Cannon Drive) and Ashcake Road on the north and south ends town, respectively, to improve traffic operations and safety at these two crossings. The architectural features of these new structures will be designed to befit the visual setting with minimal structural elements or appurtenances.

2. **Page 3-54 of the Draft EIS lays out the definition of Visual Resources: "Viewers in visually sensitive resource areas are typically involved in outdoor activities where their sensitivity to the surrounding visual environment may be heightened." However, later on page 3-66 of the Draft EIS, it states in regard to VAU 5-2 or the western bypass of Ashland that "no sensitive visual resources are identified within this unit." This is incorrect, as bicyclists, walkers, and joggers frequent Yowell Road and the private residences there. This area of private residences provides a visual resource to viewers traveling in this VAU and should be taken into consideration in the final copy of the EIS given its regular recreational use.**

Subsequent to the publication of the Draft EIS, Alternative 5A was selected as the Preferred Alternative. The Preferred Alternative does not include any bypass alignments (Build Alternative 5C and 5C–Ashcake in Ashland, as evaluated in the Draft EIS).

Visually sensitive resources along the Project corridor are defined as those typically open to many viewers, not just an individual residence. That said, DRPT recognizes the unique visual quality of this area and accounted for it with the visual assessment unit impact rating as shown in the Draft and Final EIS. The overall change to the visual assessment unit (VAU) is considered as part of the Project, not just impacts to visually sensitive resources.

3. **The Project will have a negative visual and noise impact on homes and Blue Park in Alexandria if the existing "greenbelt" of mature trees and shrubs along the railroad tracks are cut down. The Draft EIS maps show that some of this greenbelt is within the Project's area of temporary and permanent impact.**

Under the Preferred Alternative 2A, the additional track in the area nearest Blue Park would be located on the east side of the existing tracks (opposite side from Blue Park) and the existing tracks would be shifted slightly to the west in the direction of the park. However, all work on the west side of the tracks nearest the park would be conducted within the existing CSXT right-of-way. Impacts to the existing trees and vegetation within the existing right-of-way would be minimized to the greatest extent practical to maintain the visual buffer between the park and the rail corridor. Note that CSXT may choose to remove or modify vegetation within their right-of-way at any time.

HAZARDOUS MATERIALS

1. **The DC2RVA will provide CSXT an upgraded rail system with the potential of moving more freight and toxic materials though the Project corridor.**
    a. **Do more trains mean more chances that a hazardous spill will happen?**
    b. **In the Bypass alignments, the Project will be introducing the potential for hazardous materials in previously pristine places. How is that accounted for?**

Refer to Section 5.18 of the Final EIS for discussion of public health and safety associated with hazardous materials transport on the rail line, which has been updated since the publication of the Draft EIS. FRA and the United States Department of Homeland Security (DHS) regulate the transportation of hazardous materials on railroads, and part of that regulation requires all Class I railroads to maintain a safety plan for transporting such materials, which are separate from the scope of this Tier II effort.

In response to a), neither FRA nor DRPT anticipate that the addition of the 9 new daily intercity passenger round trips (18 total trains per day) would result in any change in either the types or quantities of freight shipped on the corridor. Freight shipments, including any hazardous materials, would not be affected by the Project, and are projected to increase under CSXT freight operations whether or not the Project is implemented.

In response to b), subsequent to the publication of the Draft EIS, Alternative 5A was selected as the Preferred Alternative, which does not include any Project impacts in town between Vaughan Road (Archie Cannon Drive) and Ashcake Road. The Preferred Alternative does not include any bypass alignments (Build Alternatives 3C in Fredericksburg and 5C and 5C–Ashcake in Ashland, as evaluated in the Draft EIS).

INDIRECT AND CUMULATIVE EFFECTS

1. **Concern about secondary/cumulative impacts in and around Fredericksburg**

Draft EIS Sections 4.20.1.2 and 4.20.1.6 addressed potential induced development impacts of all Build Alternatives associated with the Project. The locations where induced growth might occur are focused near the stations where access to improved intercity passenger rail services would be provided. In the Fredericksburg area, that would be Fredericksburg Station. Inducement of growth requires access to the rail services at the station locations in the same manner as highway interchanges provide access to the interstate highway system. FRA guidance suggests defining the station area in terms of 0.25- and 0.5-mile radii of the station. Accordingly, the study area for analysis of potential induced development was defined as the areas within a 0.5-mile radius of the station locations.

There are many factors influencing the ongoing development in the Fredericksburg region regardless of any previous or future rail improvements.

As described in Draft EIS Section 1.5.2.6 in the Project Need and summarized in Section 1.3 of the Final EIS, providing more consistent, reliable, on-time passenger rail service is expected to induce more people to travel by rail, which would in turn reduce demand on parallel roadways. Although the proposed rail improvements could potentially provide a small incremental boost to the attractiveness of the region, that attractiveness already has been in play for decades due to the existing roadway network and other factors noted above. Moreover, the region increasingly is becoming more than a bedroom community to Washington, D.C. and northern Virginia as development mass and diversity now support more "home-grown" markets and industries. Regional business and government leaders have undertaken strategic planning efforts to target retention and expansion of industries best suited to the location and economic strengths and capabilities of the Fredericksburg Region. In such an environment, any contribution to the region's attractiveness would be consistent with regional goals and planning and would be overshadowed by other forces driving further development in the region.

2. **In the Richmond Area, the Draft EIS does not take into account the indirect/cumulative effects of the Project, including induced development.**

Expected indirect and induced impacts in the vicinity of Main Street Station from the Preferred Alternative are addressed in Section 5.20 of the Final EIS, which has been updated since the publication of the Draft EIS. Additionally, in response to comments received on the Draft EIS, DRPT has included Section 3.1.4 of the Final EIS, which contains additional discussion of potential indirect and induced impacts on the slave district issues.

SAFETY

1. **Does adding a third rail increase the risk of train derailments?**

Adding a third track to the existing two track corridor does not inherently increase the risk of derailments, especially as new improvements are built to current safety standards. However, any increase in the number of passenger and freight trains in the corridor does increase the likelihood of derailments, just as increasing the number of cars using a particular road increases the likelihood of accidents. The third track will be constructed to meet FRA and CSXT standards for safety and performance, and the Project will include improved signals and communications systems and improved safety systems for all at-grade crossings. However, there may be an increase in the number of derailments regardless if the Project is implemented or not, as the number of trains using the corridor increases over time. CSXT freight service and VRE commuter service is projected to increase without the Project.

2. **Within Ashland, a third track would significantly endanger Randolph-Macon College's students, faculty and staff, and tens of thousands of annual visitors.**

Randolph-Macon College is located on both sides of the existing railroad mainline in downtown Ashland, and has plans for expansion including dormitories on the west of the tracks, with the main campus on the east side of the tracks. Crossing the railroad tracks at other than designated crossings is unsafe and is a violation of Virginia code §18.2-159. Nonetheless, students and other pedestrians often walk across the existing tracks, and increased train service in the future can exacerbate the situation. Recognizing such, the CTB resolution recommending Alternative 5A as the Preferred Alternative for the Ashland/Hanover area (Appendix H of the Final EIS) directed DRPT to explore the need for other safety improvements to pedestrian and vehicle at-grade crossings within the Town of Ashland, separate from the DC2RVA Project. Therefore, DRPT is committed to work with the FRA, VDOT, Town of Ashland, Randolph-Macon College, and CSXT to identify safety improvements for pedestrians, bicycles and vehicles crossing the tracks in Ashland that minimize the acquisition of additional right-of-way, and DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

3. **Within Ashland, parked cars on Center Street/Railroad Avenue block visibility whether driving, walking, or biking. The difficult combination of street traffic, pedestrians, and trains from multiple directions is unsafe—how will the Project change these unsafe conditions?**

Center Street/Railroad Avenue is an existing condition of the local roadways and is controlled by the Town of Ashland. The Preferred Alternative 5A: Two Tracks Through Town would increase the number of trains through town by approximately one train per hour in each direction, depending on the time of day, without affecting the designated parking. However, the CTB has directed DRPT to explore the need for other safety improvements to pedestrian and vehicle at-grade crossings within the Town of Ashland, separate from the DC2RVA Project. Therefore, DRPT is committed to work with the FRA, VDOT, Town of Ashland, Randolph-Macon College, and CSXT to identify safety improvements for pedestrians and vehicles crossing the tracks in Ashland that minimize the acquisition of additional right-of-way, and DRPT will continue the outreach for other safety improvements separate from the obligations of the DC2RVA Project.

OTHER

1. **In Ashland, the analysis of the through town alternatives does not take into account the 100-year old trees and their history that would be destroyed. They date back to the Civil War.**

Although none of the mature trees located along the rail line in downtown Ashland are listed in the National Register of Champion Trees or Virginia's Big Trees program, they were considered in the visual and cultural resource evaluations. The stately trees were considered for their important part in the context (or setting) of downtown Ashland. The Preferred Alternative 5A: Two Tracks Through Town does not have any permanent or temporary impacts in town between Vaughan Road (Archie Cannon Drive) and Ashcake Road, so it will not impact the noted trees (directly or indirectly).

2. **What are the impacts to east coast commerce and international trade, if the DC2RVA corridor were incapacitated? There should be a north-south rail infrastructure back-up plan in a geographically separate location in case something occurred along the DC2RVA corridor, such as a natural or man-made emergency.**

FRA and DRPT recognize that the Project corridor is an integral part of the freight rail commerce and trade distribution network, and the DC2RVA Project proposes to accommodate efficient movement of rail freight traffic in the DC2RVA corridor. However, the primary Purpose of the DC2RVA Project is to increase railroad capacity between Washington, D.C. and Richmond to deliver higher speed passenger rail while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. Consideration of larger regional and national network emergency issues, such as a back-up plan for redundant capacity in a different geographic location, is beyond the scope of the DC2RVA Project as Project improvements are limited to those necessary to meet the DC2RVA Purpose and Need.

FUNDING, CONSTRUCTION, AND IMPLEMENTATION

Chapter 7 of the Final EIS presents an overview of future steps for the Project that would occur after publication of the Final EIS, including funding, final design, permitting, construction, and implementation.

1. **Questions regarding Project funding, funding sources and timing, and/or funding for construction.**
    a. **Who is paying for this Project?**
    b. **DRPT claims that this Project will be paid for by "federal state and local sources" but have failed to advise the public that this "source" is our tax dollars.**

In response to a) and b), funding for the current DC2RVA Tier II EIS is from an FRA grant for high speed intercity passenger rail development. The Commonwealth of Virginia and CSXT are providing the local match to the federal grant. The DC2RVA Project is not funded beyond the NEPA Tier II EIS; however, as of the publication of the Final EIS, DRPT has secured funding from both the U.S. DOT FASTLANE program and state sources to construct a fourth mainline track for approximately six miles between the Potomac River and Alexandria, as part of the Commonwealth's "Atlantic Gateway" program, described in greater detail in Section 7.7.1 of the Final EIS.

DRPT anticipates that the DC2RVA Project will be implemented incrementally, as funding becomes available. DRPT has not secured funding for Project construction, but has identified several possible sources of funds, including public and private sources. Potential federal sources for construction funding include FRA high speed intercity passenger rail grant funds, U.S. DOT Transportation Investment Generating Economic Recovery (TIGER) or Better Utilizing Investments to Leverage Development (BUILD) Discretionary Grant funds, and other Federal discretionary sources, subject to future appropriations. Other non-federal funding sources include the Commonwealth of Virginia, local governmental, and private sector funds. The new DC2RVA service would be part of Virginia's state -supported passenger rail system and a system of long-distance Amtrak and multi-state high speed rail lines. Therefore, operation and maintenance cost would be covered by a combination of passenger fare revenue recovery and state, federal, and/or local funds.

2. **How much will the new service fare cost? The cost of travel, not the number of trains, is the biggest obstacle to regularly using Amtrak. Will there be fare reductions compared to existing pricing?**

Fares are not determined during this stage in the NEPA process. The DC2RVA Project service plan includes adding 9 new daily intercity passenger round trips (18 total trains per day) in the corridor, and DRPT anticipates that these trains – like other intercity passenger trains on the corridor - would be operated by Amtrak. The fares for passenger service on these new trains would be set by Amtrak, in coordination with DRPT and other stakeholders, at the time the trains are brought into service. Additional information on implementing the 9 new daily intercity passenger round trips (18 total trains per day) intercity passenger trains will be included in the Corridor Service Development Plan, which is being prepared by DRPT as part of the DC2RVA Project.

3. **Construction-related questions and/or issues**
    a. **How long would the Project take to construct?**
    b. **What does access to private property during construction look like?**
    c. **How will emergency access to properties occur during construction?**
    d. **What does construction phasing look like? Could the third rail alternatives be phased within Ashland that Center Street is not closed for the duration of the construction?**
    e. **There needs to be a robust process to ensure that new construction minimizes the impacts on adjacent neighborhoods and that there is a robust and transparent process for residents to monitor decisions and to be able to influence plans and actions.**

In response to a), the period of construction has not been determined, and is dependent on Project funding. For the purposes of this analysis, DRPT assumed that the DC2RVA Project would be fully built (infrastructure built and proposed intercity passenger trains in service) by 2025. Actual dates for future Project development are dependent on obtaining a Record of Decision (ROD), identifying and securing construction funding, completing Project design, and finalizing all necessary approvals and permits, including agreements with Amtrak and CSXT. DRPT anticipates the Project would be built in increments, with higher priority given to adding capacity to the Arlington, Northern Virginia, and Fredericksburg areas, followed by Richmond, Central Virginia, and Ashland areas. Full details on the anticipated dates and order of future steps of the Project are provide in Chapter 7 of the Final EIS.

In response to b) and c), access to private properties will be determined during future phases of design as it is beyond the level of detail of the conceptual engineering that was prepared in support of the Draft and Final EIS. A construction management plan will be prepared during final design, which will address means and methods to maintain safe access to all properties, including midblock properties in Ashland, and/or to mitigate any access impacts to the property. Emergency access to homes will be maintained to all properties during construction and will be coordinated with First Responders. If emergency access cannot be maintained, relocation of residents or other means of mitigation would be required.

In response to d), the extent and duration of any construction-related road closures will be determined after funding is secured and during final design, which will include development of a construction management plan to consider maintaining traffic on public and private roads to allow for property access and flow of traffic. With regard to Ashland specifically, subsequent to the publication of the Draft EIS, Alternative 5A was selected as the Preferred Alternative, which does not include any Project impacts in town between Vaughan Road (Archie Cannon Drive) and Ashcake Road; the Preferred Alternative will not impact Center Street in Ashland.

In response to e), a construction management plan will be developed for the Project that identifies measures to be taken to minimize construction impacts to local neighborhoods, roadways, and other resources, during final design. Short-term impacts due to construction activities will be minimized through the use of prescribed Best Management Practices. Work in protected resource areas such as wetlands, water bodies or floodplains, will be performed in accordance with stipulations contained in the permits issued by the regulatory agencies. Similarly work in historic districts or other areas of cultural resources will be performed per the conditions of Section 106 Draft Memorandum of Agreement (see Appendix K of the Final EIS). Details on construction practices associated with the proposed improvements are presented in Appendix L of the Draft

EIS (Constructability Technical Report), and will be further refined during future phases of Project design (refer to Chapter 7 of the Final EIS for details).

4. **After the Final EIS and ROD, what other tasks/deliverables are part of this Project? What is the "conceptual design" of this EIS versus "final design," and when would that occur?**

Chapter 7 of the Final EIS has been added since the Draft EIS to summarize the anticipated sequence of events following the publication of the Final EIS, which include: preliminary engineering; service development planning; funding; final design and permitting; construction and implementation; coordination with other ongoing studies and projects; and other federal actions, permits, and regulatory approvals.

The current Tier II DC2RVA EIS is being funded from an FRA grant with the Commonwealth of Virginia and CSXT providing the local match to the grant. The grant includes preparing the DC2RVA Tier II EIS, which will culminate in a ROD produced by FRA. The ROD will identify mitigation measures and related commitments by FRA and DRPT. In addition to the EIS and ROD, the grant includes funding for DRPT to prepare Preliminary Engineering Design (e.g., design to about the 30% level) of the DC2RVA track and roadway improvements. DRPT is preparing a Corridor Service Development Plan that: develops updated ridership and revenue forecasts for the new service; reviews the rail operational plan for the new service, including rolling stock requirements, crew and equipment scheduling, and terminal, yard and support operations; conducts a station access analysis for the new service; identifies operations and maintenance costs; and provides an estimate of public benefits.

DRPT anticipates that the DC2RVA Project will be implemented incrementally as funding becomes available. Once funding becomes available for a segment of the Project, DRPT and/or CSXT will initiate final design for that segment, apply for applicable environmental and construction permits and easements, acquire additional right-of-way, and finalize specific mitigation requirements.

APPENDIX D

UPDATED CULTURAL RESOURCES REPORTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix D

UPDATED CULTURAL RESOURCES REPORTS

Following this introduction, the updated cultural resources information is presented in the following order:

- D1. Section 106 Determinations of Effect
- D2. Phase IB Archaeological Survey Preferred Alternative Limits Of Disturbance
- D3. Architectural Reconnaissance Survey Limits of Disturbance Expansion Area
- D4. Architectural Intensive Investigations Report A
- D5. Architectural Intensive Investigations Report B
- D6. Architectural Intensive Investigations Report C

APPENDIX D1

SECTION 106 DETERMINATIONS OF EFFECT

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix D1

SECTION 106 DETERMINATIONS OF EFFECT

Section 106 of the National Historic Preservation Act of 1966 (NHPA), as amended (54 U.S.C. 306108), and implementing regulations (36 CFR Part 800) require federal agencies to consider the effects of their actions on historic properties and to afford the Advisory Council on Historic Preservation (ACHP) an opportunity to comment if the action would result in an adverse effect on any property listed in or eligible for the National Register of Historic Places (NRHP). The purpose of this appendix is to provide additional detail on the background and history of the Section 106 process that led to the determinations of effect for the cultural resources that are summarized in the Final Environmental Impact Statement (EIS), specifically Chapter 5 (Environmental Consequences) and Chapter 6 (Final Section 4(f) Evaluation).

- Section D1.1 identifies the historic properties
- Section D1.2 identifies the determination of effect for each historic property
- Section D1.3 summarizes mitigation measures related to the determinations of effect

The archaeology and architecture reports are presented in Appendices D2 through D6 of the Final EIS and Appendix R of the Draft EIS, and include mapping of cultural resources. Comments and coordination on the Section 106 process are provided in Appendix E of the Final EIS.

D1.1 ARCHAEOLOGICAL AND ABOVE GROUND CULTURAL AND HISTORIC RESOURCES

Through the cultural resource studies for the Project (see Appendices D2 through D6 of this document and Appendices R and U of the Draft EIS), DRPT identified 120 historic properties within the Project's Area of Potential Effect (APE)[1] for the Preferred Alternative. These 120 historic properties are presented in Table D1.1-1, and include:

- 13 archaeological sites
- 96 above ground resources
- 1 resource with above ground and below ground components
- 10 battlefields

---

[1] The APE is defined before the identification of historic properties and includes areas where the Project could impact character-defining features, directly or indirectly. While the Project limits of disturbance (LOD) are the physical boundary of construction and related activities, the APE considers all locations where the Project may result in ground disturbances, visible or audible disturbances, or changes in public access, traffic patterns, or land use.

All 120 resources were evaluated under Section 106 of the National Historic Preservation Act to determine Project effects, detailed in Section D1.2 and summarized in Chapter 5, which highlights determinations of adverse effect, no adverse effect, and no effect for each resource. The 120 Section 106 properties were also evaluated separately under Section 4(f) of the Department of Transportation Act, which is provided in Chapter 6 of the Final EIS.

Changes since the Draft EIS. There were 158 historic properties reported in the APE of all Build Alternatives under consideration in the Draft EIS. Since the publication of the Draft EIS, engineering refinements to the Limits of Disturbance (LOD) have occurred to minimize impacts of the Preferred Alternative. Additional cultural resource studies were completed for the Preferred Alternative between January and July 2018, including Phase I archaeological survey, reconnaissance architectural survey, and intensive architectural studies. This work, as well as a reanalysis of all previously recorded resources in the APE and extensive coordination with Section 106 consulting parties and the general public, resulted in modifications to the draft list of historic properties in the APE. Since the publication of the Draft EIS, 53 resources were removed from the list and 15 were added, resulting in an updated total of 120 historic properties in the Project APE of the Preferred Alternative to be evaluated as part of the Final EIS.

- Resources that have been added to the APE since the Draft EIS are denoted by an asterisk in Table D1.1-1.
- Resources that have been removed from the APE since the Draft EIS are listed separately in Table D1.1-2.

NHRP Eligibility. A historic property is defined as any resource that is eligible for, assumed eligible for, or listed in the National Register of Historic Places (NRHP). The majority of the 120 historic properties that are included in the Final EIS (n=93) have been determined to be eligible for or are already listed in the NRHP. Another 26 have been determined to be potentially eligible for the NRHP, but are being assumed to be eligible as part of this Project. Most of these resources are archaeological sites that have been identified but not yet the subject of Phase II-level archaeological testing. If any of these sites will be impacted by the Project, DRPT has committed to completing data recovery studies on impact areas regardless of eligibility determinations. The one remaining resource was not accessible during the technical studies due to denied property access. DRPT has elected to consider this resource eligible for the NRHP as well. Regardless of eligibility status (potentially eligible, eligible, listed, or not accessible), DRPT is treating all 120 resources as historic properties. DRPT determined that these resources meet one or more of the following NRHP eligibility criteria:

- Criterion A—Associated with events that have made a significant contribution to the broad patterns of our history.
- Criterion B—Associated with the lives of persons significant in our past.
- Criterion C—Embodies the distinctive characteristics of a type, period, or method of construction, or that represents the work of a master, or that possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction.
- Criterion D—Has yielded or may be likely to yield information important in prehistory or history. Although resources considered eligible for the NRHP under Criterion D alone are evaluated for project effect, a resource must be eligible for one other criterion in

addition to D (wherein preservation in place in warranted) to be considered a Section 4(f) resource.

In addition to the four criteria listed above, there are seven additional criteria considerations. Ordinarily cemeteries, birthplaces, graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the NRHP. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following "additional criteria consideration" categories:

a) A religious property deriving primary significance from architectural or artistic distinction or historical importance; or

b) A building or structure removed from its original location but which is primarily significant for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or

c) A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building associated with his or her productive life; or

d) A cemetery that derives its primary importance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or

e) A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or

f) A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or

g) A property achieving significance within the past 50 years if it is of exceptional importance.

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County, City of Alexandria	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and much of the concrete remains intact.	Listed under Criteria A and C	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six ca. 1941 airplane hangars and associated runways and other landscape elements.	Listed under Criteria A and C

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	
5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	
7	100-0124	Alexandria Union Station, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style.	Listed under Criteria A and C	

▶ *Continued – see end of table for notes.*

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the "sole remaining example of a mill structure in Alexandria."	Eligible under Criteria A and C	
10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building is a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	

▶ *Continued – see end of table for notes.*

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
12	500-0001-0022	RF&P Bridge over Occoquan River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	500-0001-0022
13	076-0023	*Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and future site of the railroad) was documented by Benjamin Latrobe.	Listed under Criteria A and B	
14	44ST1223	*Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	

▶ *Continued – see end of table for notes.*

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/ Potentially Eligible under Criterion A	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/ Potentially Eligible under Criterion A	
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericksburg HD and RF&P HD	111-0132-0025

► *Continued – see end of table for notes.*

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
49	042-0093	Doswell Depot and Tower, 10577 Doswell Rd	Hanover County	ca. 1928	The current depot is a well-balanced design with classical-styled architectural features. The nearby, contemporaneous "HN tower" housed electrical systems managing an interlocking device permitting safe crossing of trains over both railroads.	Eligible under Criteria A and C; Contributes to RF&P HD and Doswell HD	
50	042-5307	Taylorsville Road Historic District	Hanover County	ca. 1900-1935	The community was settled in the early–nineteenth century and has remained active to present day. Most built features are residential and agricultural in nature within the district and reflect architectural styles and construction methods from the late-nineteenth to mid-twentieth century.	Eligible under Criteria A and C	
51	042-0556	*Hoopers, 11108 McConnell Lane	Hanover County	1810	Resource was recorded during the LOD survey document, but it was not accessible during the study; DHR suggested that it be considered potentially eligible for the Project on April 4, 2018.	Not evaluated; Not accessible (Assuming eligible for undertaking)	
52	166-5073	Berkleytown Historic District	Hanover County	ca. 1900-1965	The district is typical of many small-town, twentieth-century, African-American neighborhoods in that it was relatively isolated from the formal downtown core and is dotted by small vernacular dwellings.	Eligible under Criterion A

Table D1.1-1: List of Historic Properties in APE of Preferred Alternative

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
100	127-0457	Manchester Warehouse Historic District	City of Richmond	1880-1960	The district comprises 42 blocks of industrial development associated with the growth and development of the community of Manchester, an area south of the James River that was once a separate town but later incorporated within the City of Richmond.	Listed under Criteria A and C	
101	127-6193	J.P. Taylor Leaf Tobacco, Southern Stove Works, 516 Dinwiddie Ave	City of Richmond	1920	This resource mirrors other early-20th century factories in the area: all brick construction, with regularly spaced and relatively large windows, and sections of light monitor on the pitched roof apex for allowing natural light for the workers. It was used as a stove factory and then for tobacco processing.	Listed under Criteria A and C	
102	127-6245	Williams Bridge Company, Emergency Fleet Corporation Factory, 700 East 4th Street	City of Richmond	1919	Built in 1919 to assist with World War I war efforts; also used by the U.S. government during World War II; eligible boundary contains main factory and apartment structures used to house workers during both world wars.	Eligible under Criteria A, C, and D	127-6245 WILLIAMS BRIDGE COMPANY
103	127-6248	Pure Oil Company, 1314 Commerce Street, Transmontaigne	City of Richmond	1936	This property has been used to refine, store, ship, and process oil extracts for almost 80 years; founded in 1928 as Gulf Refinery Company; associated with the history of oil production and transport in Richmond.	Eligible under Criteria A and C

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
104	127-6213	Davee Gardens Historic District	City of Richmond	1947	This district is a planned, symmetrical suburb of Richmond, established in 1947. Homes in the neighborhood retain a high degree of historic integrity, and the street plan is emblematic of post-World War II design.	Eligible under Criteria A and C	
105	127-5818	*Philip Morris Operations Complex, 3601 Commerce Road	City of Richmond	1959–1974	This is a mid-twentieth-century, light-industrial complex that serves as headquarters for the company's tobacco production. They are unique industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles.	Eligible under Criteria A and C and Criteria Consideration G	
106	020-5474	DuPont Spruance	Chesterfield County	1929	The first of several buildings on the DuPont Spruance Plant was constructed under the ownership DuPont Rayon Co. This large factory has played a significant role in the development of textiles and plastics in the United States.	Eligible under Criteria A and C	
107	043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road	Chesterfield County, Henrico County, City of Richmond	1862	The Battle of New Market Heights is nationally significant because of the all-important role played by Black soldiers in this fight and the recognition of their gallantry by the United States government through the award of 14 Medals of Honor to participants.	Eligible under Criterion A

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
108	020-0063	Falling Creek Ironworks Archaeological Site	Chesterfield County	1619	The Falling Creek Ironwork archaeological site was originally recorded as the location of the Virginia Company Ironworks. Subsequent investigation suggests that it could also be Cary's Ironworks, destroyed in 1781 during the American Revolution.	Listed under Criterion D	109	020-5320	Proctor's Creek Battlefield	Chesterfield County, Colonial Heights	1864	Currently the battlefield consists of monuments, interpretive markers (state and freeman markers/park service interpretation at Fort Darling unit/county interpretation at Fort Stephens), a cemetery, historic road beds, period structures (Wooldridge, Willis, Halfway houses), and trenches/field fortifications.	Eligible/Potentially Eligible under Criterion A	110	020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Chesterfield County, Henrico County	1862	Drewry's Bluff encompasses 42.4 acres of land. The CCC camp based at Fort Harrison rehabilitated the site in 1935, clearing brush and trees and stabilizing the earthworks.	Eligible under Criterion A	
111	123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	This resource includes a Civil War battlefield that represents part of the Richmond Petersburg campaign in and around Petersburg. Today, the battlefield consists of earthworks, roadways, and other features as well as interpretive materials.	Eligible under Criterion A

112	020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District	Chesterfield County	post-1942	The district is a group of residential, industrial, and military buildings dating from the construction Sheffield/Bellwood Manor (020-0007), circa 1804, to the development of the Korean Conflict era buildings in 1952.	Eligible under Criteria A, B, C, D	
113	020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy	Chesterfield County	1804	This resource is significant as a representative of an early-nineteenth century antebellum plantation that has evolved into a modern, twentieth-century farm and dairying operation. The main house is an excellent example of vernacular interpretation of the Early Classical Revival style in the piedmont area constructed in an I-form. Numerous archaeological resources are located on the parcel.	Listed under Criteria A, C, and D	114	44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	The earthworks were developed by Confederate troops as part of the Outer Line of defenses for Drewry's Bluff. Although some segments of the earthworks have been destroyed, the extant areas remain in excellent condition and the remaining elements of the artillery battery, trenches, and gun emplacements are representative of earthworks developed in this area during the Civil War.	Eligible under Criteria A, C, and D

North-South Order	DHR ID	Name/Description	City/County	Date/Time Period	Description	NRHP Eligibility	Image
115	020-5351	Richmond & Petersburg Electric Railway	Chesterfield County	1902	This resource contains the alignment of the regional trolley system. Creation of this line was the direct impetus for large-scale modifications to settlement patterns in central Virginia.	Eligible under Criterion A	
116	020-0013	House, 3619 Thurston Road	Chesterfield County	1913	This resource is a 1.5-story Colonial Revival dwelling with a gambrel roof and flared eaves. It retains a high degree of architectural integrity.	Eligible under Criterion C	117	127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	City of Richmond, Chesterfield County	post 1833	Historic railroad corridor that represents the origins and growth of the railroad industry in the Richmond to Petersburg corridor; reflects the post-Civil War trend of merging smaller operations to provide better service while being more economical.	Eligible under Criterion A	
118	020-5378	VEPCo Power Transmission Line	Chesterfield County	ca. 1910	The VEPCo Line was built The line was built sometime between 1910 and 1930, likely between 1925 and 1927, providing high-voltage electric power service to the people in the area. It is approximately one mile long, and it is the only remaining portion of the line that once extended from Richmond to Petersburg.	Eligible under Criteria A and C

127-6693	Armitage Manufacturing Company, 3200 Williamsburg Avenue (Function/Location)
127-6255	Fulton Gas Works, Williamsburg Avenue
127-0257	Bridge #8067
043-5313	James River Steam Brewery Cellars, 4920 Old Main Street
043-0439	Aviation General Supply Depot, 508 Bickerstaff Road
043-5071	Darbytown & New Market Roads Battlefield, Route 5
020-0022/ 44CF0680	Centralia Earthworks (repeated in Draft EIS as both above- and below-ground resources; one removed in Final EIS)

D1.2 SECTION 106 EFFECT DETERMINATIONS

FRA has completed an evaluation of effect of the Preferred Alternative for the Project on historic properties in accordance with Section 106. DHR has concurred with these recommendations. Effects are defined as adverse effect (the Project would diminish the characteristics that render a property eligible for the NRHP); no adverse effect (the Project may alter an aspect of the resource's integrity but the character-defining features that rendered it eligible for the NRHP would remain intact); or no effect (the Project does not have the potential to alter or diminish aspects of the historic property that render it eligible for the NRHP).

The Project will have an adverse effect on 21 historic properties, as shown in Table D1.2-1. It will have no adverse effect on 69 historic properties and no effect on 30 properties. Details on these effect determinations are discussed in the sections below the table, by resource type:

- Archaeological sites
- Architectural sites, which includes above ground resources including buildings, districts, structures, and objects
- Battlefields

Table D1.2-1: Summary of Effect Determinations on Historic Properties, Preferred Alternative

Type of Historic Property	Effect Determination (Number of Resources)		
	Adverse	**No Adverse**	**No Effect**
Archaeological Resources	8	6	0
Architectural Resources	13	54	30
Battlefields	0	10	0
Total for the Preferred Alternative:	21	69[1]	30

Notes: 1. Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive (111-0147) is both an above and below ground resource, and it is counted in the table twice in the "No Adverse Effect" column, as both an Archaeological Resource and a Historic Resource. Therefore, while the numbers in the three historic property categories under "No Adverse Effect" add to 70, the total for the Preferred Alternative is 69 individual resources.

D1.2.1 Archaeological Resources

FRA's determinations of effect for archaeological resources in Virginia for the Preferred Alternative of the Project are summarized in Table D1.2-2 and detailed in Table D1.2-3. DHR has concurred on these determinations in letters dated June 28, 2018, July 18, 2018, and January 4, 2019. Data recovery excavations will be completed on any segment of these sites that will be impacted by the Project. Details on the data recovery are included as stipulations in the Draft Section 106 Memorandum of Agreement (MOA) that is being developed as part of the environmental process (see Appendix K of the Final EIS).

Table D1.2-2: Summary of Effect Determinations on Archaeological Sites

Alternative Area	Alternative	Effect Determination (Number of Resources)		
		Adverse	No Adverse	No Effect
Area 2: Northern Virginia (Long Bridge Approach to Dahlgren Spur)	2A	1	0	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0	0	0
Area 3: Fredericksburg (Dahlgren Spur to Crossroads)	3B	4	2	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0-1	0-1	0-3
Area 6: Richmond (I-295 to Centralia)	6F	3	3	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0-3	4-7	2-4
Total[1] for the Preferred Alternative:		**8**	**5**	**0**

Notes: 1. Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive (111-0147) is both an above and below ground resource and is included in the above totals as "No Adverse Effect."

There are no archaeological sites within the APE in Alternative Areas 1, 4, and 5, so they are not shown in the table.

Table D1.2-3: Details of Effect Determinations on Archaeological Sites (Listed North to South)

DHR ID	Name/Description	City/County	Date/Time Period	NRHP Eligibility	DHR Effect Determination
44ST1223	Civil War Campsite	Stafford County	1862-1863	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse
111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	Listed under Criteria A and D	No Adverse
44SP0187	Bridge/Marye's Mill	City of Fredericksburg	19th century	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse
44SP0688	Block 49/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse

▶ *Continued.*

Table D1.2-3: Details of Effect Determinations on Archaeological Sites (Listed North to South)

DHR ID	Name/Description	City/County	Date/Time Period	NRHP Eligibility	DHR Effect Determination
44SP0687	Block 48/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse
111-0145	Fredericksburg Gun Manufactory	City of Fredericksburg	ca. 1775	Listed under Criteria A and D	No Adverse
44SP0468	Earthwork/ Jackson's Earthwork	Spotsylvania County	1861	Potentially Eligible under Criteria A, C and D (Assuming eligible for undertaking)	Adverse
44HE1203	Grave Yard for Free People of Color and Slaves	City of Richmond	1816	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	No Adverse
44HE1053	Lumpkins Jail/ Devil's Half Acre	City of Richmond	1830s through 1850s	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	No Adverse
44HE1098	Main Street Station Parking Lot/Railroad	City of Richmond	19th century	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse
44HE1097	Railroad, Warehouse	City of Richmond	19th century	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse
44HE1094	Warehouse	City of Richmond	19th century	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse
020-0063	Falling Creek Ironworks Archaeological Site	Chesterfield County	1619	Listed under Criterion D	No Adverse
44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	Eligible under Criteria A, C, and D	No Adverse

D1.2.2 Historical Resources

Ninety-seven (97) eligible or listed buildings, districts, structures, and objects are located within the APE of the Preferred Alternative for the Project: 96 above ground resources and 1 that has an above ground and below ground component. They range from single-family rural dwellings to significant historic districts along the rail corridor. Main Street Station (127-0172) in Richmond is also a National Historic Landmark (NHL); see the technical reports in Draft EIS Appendix R and Final EIS Appendix D2–D6 for additional details.

FRA's determinations of effect for historic resources in the Project APE are listed in Table D1.2-4; details of all resources can be found in Table D1.2-5. DHR has concurred with these determinations in letters dated June 28, 2018, July 18, 2018, and January 4, 2019. Discussions of the coordination of these determinations with DHR and relevant consulting parties is provided in Appendix E of this Final EIS.

Table D1.2-4: Summary of Effect Determinations on Buildings, Districts, Structures, and Objects

Alternative Area	Alternative	Effect Determination (Number of Resources)		
		Adverse	No Adverse	No Effect
Corridor Wide[1]	All	1	0	0
Area 1: Arlington (Long Bridge Approach)	1B	0	2	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		1	2	0
Area 2: Northern Virginia (Long Bridge Approach to Dahlgren Spur)	2A	2	5	3
Impacts reported in Draft EIS for this Alternative		1	10	4
Area 3: Fredericksburg (Dahlgren Spur to Crossroads)	3B	2	8	4
Range of impacts for all Draft EIS Alternatives in this Alternative Area		1-4	0-11	0-15
Area 4: Central Virginia (Crossroads to Doswell)	4A	2	8	3
Impacts reported in Draft EIS for this Alternative		3	12	4
Area 5: Ashland (Doswell to I-295)	5A	3	2	11
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0-7	0-10	0-16
Area 6: Richmond (I-295 to Centralia)	6F	3	29	9
Range of impacts for all Draft EIS Alternatives in this Alternative Area		7-16	42-60	2-11
Total[2] for the Preferred Alternative:		**13**	**54**	**30**

Notes: 1. The RF&P Railroad (500-0001) spans the majority of the Project corridor from the Potomac River on the north to Main Street Station in Richmond on the south.

2. Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive (111-0147) is both an above and below ground resource and is included in the above totals as "No Adverse Effect."

Table D1.2-5: Details of Effect Determinations on Buildings, Districts, Structures, and Objects (Listed North to South)

DHR ID	Name / Description	City / County	Date / Time Period	NRHP Eligibility	DHR Effect Determination
500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	Eligible under Criterion A	Adverse
029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County, City of Alexandria	ca. 1929	Listed under Criteria A and C	No Adverse
000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	Listed under Criteria A and C	No Adverse

D1.2.3 Battlefields

There are 10 battlefields located in the APE, all of which are associated with Civil War activities located in areas that were sites of numerous troop engagements during the war, notably the localities from Stafford County to the southern terminus of the Project. The resources were defined and mapped based on the American Battlefield Protection Program (ABPP)-defined Potential National Register (PotNR) boundaries, as determined in 2009. If PotNR boundaries were not available, DHR boundaries were used. In February 2016, DHR agreed to use these boundaries in the current analysis.

FRA's determinations of effect for historic resources in Virginia are listed in Table D1.2-6; details on each battlefield are presented in Table D1.2-7. DHR concurred with these determinations in letters dated June 28, 2018, July 18, 2018, and January 4, 2019. Based on dialogues with DHR, the Project will have no adverse effect on all 10 battlefields within the APE.

Table D1.2-6: Summary of Effect Determinations on Battlefields

Alternative Area	Alternative	Effect (Number of Resources)		
		Adverse	No Adverse	No Effect
Area 3: Fredericksburg (Dahlgren Spur to Crossroads)	3B	0	4	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0	0-3	0-3
Area 4: Central Virginia (Crossroads to Doswell)	4A	0	1	0
Impacts reported in Draft EIS for this Alternative		0	1	0
Area 6: Richmond (I-295 to Centralia)	6F	0	5	0
Range of impacts for all Draft EIS Alternatives in this Alternative Area		0	4-6	0-2
Total for the Preferred Alternative:		**0**	**10**	**0**

Notes: There are no battlefields within the APE in Alternative Areas 1, 2, and 5.

Table D1.2-7: Summary of Effect Determinations on Battlefields (Listed North to South)

DHR ID	Name/Description	City/County	Date / Time Period	NRHP Eligibility	DHR Effect Determination
111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	Eligible/ Potentially Eligible under Criterion A	No Adverse

020-5320	Proctor's Creek Battlefield	Chesterfield County, Colonial Heights	1864	Eligible/ Potentially Eligible under Criterion A	No Adverse
020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Chesterfield County, Henrico County	1862	Eligible under Criterion A	No Adverse
123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	Eligible under Criterion A	No Adverse

D1.3 SUMMARY AND MITIGATION

In summary, FRA's determination is that 21 historic properties will be adversely affected by the Preferred Alternative. Eleven of these impacts will be direct, two indirect/cumulative, and eight both direct and indirect. Another 69 properties will have no adverse effect resulting from the Preferred Alternative and the remaining 30 historic properties in the APE will have no effect resulting from the Preferred Alternative.

Where FRA has determined that the Preferred Alternative will have an adverse effect on historic resources, and DHR has concurred with that determination, efforts have been undertaken to avoid, minimize, or mitigate the adverse effects. Efforts have been made by DRPT to identify a Preferred Alternative that avoids adverse effects to Section 106 resources identified in this section. Where avoidance is not possible, through the Section 106 consultation process, FRA, DRPT, DHR, ACHP, and the consulting parties have identified measures to minimize and mitigate for impacts.

The Section 106 Draft Memorandum of Agreement (MOA) has been developed based on feedback from consulting parties, property owners, and involved agencies and includes a roster of tasks to be completed on all adversely affected resources, such as public interpretation, additional research, National Register documentation, archaeological data recovery, and more, to mitigate any adverse effects caused by the undertaking. All mitigation measures are noted in the Section 106 Draft MOA, which is Appendix K of this Final EIS. Acquiring a signed MOA is the final step in the Section 106 process; a final, signed MOA will be part of the Record of Decision for the Project.

ABSTRACT

The proposed Washington, D.C. to Richmond (DC2RVA) segment of the Southeast High Speed Rail project was examined through a Phase IB archaeological survey. The proposed project is being completed under the auspices of the Federal Rail Administration (FRA) in conjunction with the Virginia Department of Rail and Public Transportation (DRPT). Because of the FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act of 1969 (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

The current archaeological study included a Phase IB survey of portions of the Preferred Alternative limits of disturbance (LOD) (Arlington [Area 1] through Richmond [Area 6]) of the DC2RVA corridor. The DC2RVA corridor has been the subject of ongoing cultural resource investigations from 2014 to the present, including a Phase IA archaeological background review and archaeological predictive model (Klein at al. 2015) and a Phase IB archaeological survey of the mainline based on modeling (McCloskey et al. 2016). Since the conclusion of the previous Phase IB archaeological work, a draft environmental impact statement resulting in the selection of a Preferred Alternative has been completed. Additionally, engineering and design work has been completed for the corridor resulting in the definition of the physical footprint of improvements for the selected Preferred Alternative, including all road modifications, straightening of curves, the addition of wyes, proposed station locations, parking areas, etc. As such, the area of potential effects (APE) studied as part of the current report was defined by the LOD of the Preferred Alternative, including the footprint of physical improvements associated with the project, inclusive of both the rail modifications and any associated roadwork, which had not been surveyed during the previous IB effort.

The archaeological study consisted of a pedestrian survey and subsurface testing, supplemented by metal detector survey, throughout the APE beyond the limits of previous Phase IB investigations. Based on the pedestrian survey, subsurface testing (and, where necessary, metal detection) was carried out in locations deemed to have potential for intact subsurface deposits. Additionally, all sites within the APE not addressed by the previous DC2RVA Phase IB archaeological study and determined eligible or potentially eligible for listing in the National Register of Historic Places (NRHP), as well as those previously recorded sites that had not been evaluated by the DHR, were examined regardless of their location within areas identified for archaeological testing. The archaeological areas subjected to Phase IB study, inclusive of pedestrian and subsurface testing, encompass 158.8 acres (64.3 ha).

Phase IB survey included a pedestrian survey and photo documentation followed by systematic subsurface testing, and metal detector survey when warranted, in locations deemed to have the potential for subsurface deposits. Pedestrian survey found that the majority of the archaeological APE was disturbed by buried utility corridors, modern development, and grading associated with the railroad. Following the pedestrian survey, a total of 511 shovel test pits (STPs) were excavated across the APE. The excavation of shovel test pits and metal detector hits resulted in the recovery of 140 artifacts that date predominantly to the historic period.

Phase IB survey resulted in the identification of 23 archaeological sites and 5 isolated finds within the surveyed portions of the APE. Of these 23 archaeological sites, 17 were previously identified archaeological sites and 6 were newly recorded. Based on this survey it is **recommended that one site, 44CF0680, remains eligible for listing in the NRHP under Criteria A and C. However, the portion of site 44CF0680 within the APE does not contribute to overall site eligibility.** The survey identified **nine archaeological sites (44HE0357, 44HE1097, 44HE1098, 44HE1094, 44SP0187, 44SP0468, 44SP0687, 44SP0688, and 44ST1223) that are recommended potentially eligible for listing in the NRHP under Criterion D.** It is further **recommended that nine sites (44CF0022, 44CF0123, 44CF0260, 44HE1203, 44HE1204, 44PW1008, 44ST0011, 44ST0270, and 44ST0271) are or remain unevaluated for the NRHP, but that the portions of all these sites within the APE do no contribute to their overall site eligibility**. The remaining **four archaeological sites (44HE1202, 44SP0767, 44SP0768, and 44ST1224,) are all recommended not eligible for listing in the NRHP**. However, sites 44ST1224 and 44SP0786 are both small family cemeteries that have not been fully delineated, so they should be avoided or their boundaries defined.

LIST OF TABLES

Table 2-1: Phase IB Archaeological Areas....2-1
Table 5-1: Summary of Identified Archaeological Sites....5-2

1 INTRODUCTION

Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team, and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted a Phase IB archaeological survey of the Arlington (Area 1) through Richmond (Area 6) areas of the Washington, D.C. to Richmond (DC2RVA) high speed rail Preferred Alternative. The project is being completed as Virginia Department of Historic Resources (DHR) File #2014-0666.

The Federal Railroad Administration (FRA) and DRPT propose passenger rail service and rail infrastructure improvements in the north-south travel corridor between Washington, D.C. and Richmond, VA. These passenger rail service and rail infrastructure improvements are collectively known as the DC2RVA project (Project). The Project will deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. The Project is part of the larger Southeast High Speed Rail (SEHSR) corridor (Figure 1-1), which extends from Washington, D.C. through Richmond, VA, and from Richmond continues east to Hampton Roads (Norfolk), VA and south to Raleigh, NC, and Charlotte, NC, and then continues west to Atlanta and south to Florida. The Project connects to the National Railroad Passenger Corporation (Amtrak) Northeast Corridor (NEC) at Union Station in Washington, D.C.

The purpose of the SEHSR program, as stated in the 2002 Tier I Final Environmental Impact Statement (EIS) completed for the full SEHSR corridor, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. The purpose of the current Washington, D.C. to Richmond SEHSR project described here is to fulfill the purpose of the SEHSR Tier I EIS within this segment of the larger SEHSR corridor. The Project, by increasing rail capacity and improving travel times between Washington, D.C. and Richmond, will improve passenger train performance and reliability in the corridor, enabling intercity passenger rail to be a competitive transportation choice for travelers between Washington, D.C. and Richmond, and beyond.

Given FRA's funding involvement and permitting through various other federal agencies, the Project is required to comply with Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations under 36CFR800. Additionally, all cultural resource work was designed to comply with the Virginia Antiquities Act (Code of Virginia § 10.1-2300) and guidelines and regulations promulgated by the DHR as necessary.

Figure 1-1

Overview of the SEHSR Corridor

1.1 PROJECT LOCATION

The Washington, D.C. to Richmond corridor spans 123 miles (198 km) along an existing rail corridor owned by CSX Transportation (CSXT) between Control Point RO (milepost [MP] CFP 110) in Arlington, VA to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County) (Figure 1-2). For the purposes of engineering and environmental planning, the Preferred Alternative has been subdivided into six areas that correspond with improvements and have been named and numbered 1–6 from north to south (Figure 1-3). In previous archaeological reports associated with the DC2RVA corridor (Klein at el. 2015; McCloskey et al. 2016) the corridor was subdivided into 22 segments. These 22 divisions have since been reorganized and incorporated into the existing 6 areas; in an effort to be consistent with the Tier II draft EIS and the impending Tier II final EIS these 6 areas have been used for the purposes of the current archaeological investigation.

At the northern terminus in Arlington, VA, the Project limit ends at the southern approach to Long Bridge, a double-track rail bridge taking the rail corridor over the Potomac River; however, the northern terminus of Union Station in Washington, D.C. will be used for ridership and revenue forecasting, as well as service development planning within the Project corridor. The southern terminus in Centralia is the junction of two CSXT routes that begin in Richmond and rejoin approximately 11 miles (17.7 km) south of the city. Proposed improvements are along CSXT-owned track, generally parallel to the I-95 corridor between northern Virginia and Richmond. From north to south, the project travels through the following counties and cities:

- Arlington County
- City of Alexandria
- Fairfax County
- Prince William County
- Stafford County
- City of Fredericksburg
- Spotsylvania County
- Caroline County
- Hanover County
- Henrico County
- City of Richmond
- Chesterfield County

In Arlington, the Project connects to existing CSXT track extending across the Potomac River on the Long Bridge into Washington, D.C. and Union Station, the southern terminus of Amtrak's NEC. At Centralia, the Project connects to both the Richmond to Raleigh segment of the SEHSR corridor and the Richmond to Hampton Roads segment of the SEHSR corridor. The Washington, D.C. to Richmond segment is an integral part of the overall Washington, D.C. to Charlotte SEHSR corridor and provides a critical link between high speed intercity passenger service from Boston to Washington, D.C. and the southeastern United States.

1.2 DC2RVA PROJECT DESCRIPTION

The Project will include specific rail infrastructure improvements and service upgrades intended to improve the travel time, service frequency, and on-time performance of passenger trains operating between Washington, D.C. and Richmond, VA. Specific improvements to the existing rail infrastructure between Arlington, VA, and Centralia, VA include:

- Corridor-wide upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and grade crossing improvements.
- Corridor-wide improvements to train operating capacity to achieve higher passenger train service frequency and reliability, including an additional main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other capacity and reliability improvements at certain locations.
- Station and platform improvements for Amtrak and Virginia Railway Express (VRE) stations.

Environmental studies (the Tier II EIS) in support of the Project continue to assess the environmental impacts of these improvements and identify ways to avoid, minimize, or otherwise mitigate such impacts.

Studies in support of the Project will address passenger and freight rail operations and service between Union Station in Washington, D.C. and Richmond and beyond, but the Project does not include physical improvements to the Long Bridge across the Potomac River or to rail infrastructure within Washington, D.C. Other projects will address improvements to the rail infrastructure north of Arlington and south of Centralia along the SEHSR corridor.

1.3 PREVIOUS SURVEYS AND CURRENT STUDY

The DC2RVA Team has been conducting Phase I-level cultural resource studies for the entire 123-mile (198 km) DC2RVA corridor since December 2014. These include Phase IA and Phase IB archaeological surveys and reconnaissance-level architectural studies. To date, the findings have been detailed in two archaeology reports and 16 architectural reports. The current study included a Phase IB archaeological survey of LOD expansion areas within the Preferred Alternative of the DC2RVA corridor in any part of the APE that was not included in a previous document. Environmental Context, Historic Context, and Background Review sections for the overall project corridor are not included, as this information was presented in previous DC2RVA project reports (e.g., Klein at al. 2015; McCloskey et al. 2016). The results of the architectural survey, examining all above-ground resources, spanning the entire 123-mile (198 km) corridor are discussed in separate documents (e.g., Anderson and Staton 2016; Manning et al. 2016; Manning and Salvato 2016; Peckler 2016; Staton et al. 2016a; Staton et al. 2016b; Staton and Lesiuk 2015; Sylvester and Staton 2016)

The current archaeological study comprises a Phase IB survey of the DC2RVA corridor based on the results of previous Phase IA (Klein at al. 2015) and Phase IB (McCloskey et al. 2016) archaeological studies of the corridor, including predictive modeling. The archaeological APE for the DC2RVA project, as defined in consultation with the DHR, includes the footprint of physical improvements associated with the project, inclusive of both the rail modifications and any associated roadwork. Since the conclusion of the previous Phase IB archaeological work, a draft EIS resulting in the selection of a Preferred Alternative has been completed. Additionally, engineering and design work has been completed for the corridor resulting in the definition of the physical footprint of improvements for the selected Preferred Alternative, including all road modifications, straightening of curves, the addition of wyes, proposed station locations, parking areas, etc. As such, the APE studied as part of the current report was defined by the LOD of the Preferred Alternative and is located generally along the existing 123-mile (198-km) CSXT rail corridor.

The cultural resource survey was conducted from February to April 2018. The fieldwork was conducted by Kevin McCloskey, Emily Calhoun, Kerry González, Mike Klein, Jonas Schnur, Theresa Ulrich, Bryce Matheny, and Jordan Scott, with Kerri S. Barile serving as Principal Investigator. Drs. Barile and Klein, as well as Ms. Calhoun and Ms. González, meet or exceed the standards established for Archaeologists by the Secretary of the Interior (SOI).

2 ARCHAEOLOGY PROJECT ORGANIZATION

The DC2RVA corridor spans 123 miles (198 km) along an existing rail corridor owned by CSXT between Control Point RO (MP CFP 110) in Arlington, VA to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County). The corridor generally parallels the I-95 corridor between Northern Virginia and Richmond, traversing twelve cities and counties (Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond, and Chesterfield County).

For the purposes of engineering and environmental planning, the DC2RVA corridor has been subdivided into six areas. Locations within these six areas were designated for archaeological survey through a review of modern aerial imagery, comparisons to DHR's site files, and in light of the predictive model created for the 2015 DC2RVA archaeological APE (Klein et al. 2015). Based on this analysis, the six DC2RVA project areas were further subdivided for the purposes of the current archaeological study, corresponding to discrete locations identified for archaeological survey. The archaeological areas subjected to Phase IB study encompassed 158.8 acres (64.3 ha). These subdivided locations, referred to as Phase IB archaeological areas, were given alphabetical letter designations within each of the larger six DC2RVA project areas (Table 2-1; Figure 2-1 through Figure 2-5).

TABLE 2-1: PHASE IB ARCHAEOLOGICAL AREAS

Project Area	Phase IB Archaeological Areas	
Area 1, Arlington	Archaeological Areas	n/a
	Total Acreage	0
Area 2, Northern Virginia	Archaeological Areas	2a, 2b, 2c, 2d, 2e, 2f, 2g, 2h ,2i, 2j, and 2k
	Total Acreage	60.9 acres
Area 3, Fredericksburg	Archaeological Areas	3a, 3b, 3c, 3d, 3e, and 3f
	Total Acreage	29.5 acres
Area 4, Central Virginia	Archaeological Areas	4b, 4c, 4d, 4e, and 4f
	Total Acreage	3.9 acres
Area 5, Ashland	Archaeological Areas	5a, 5b, and 5c
	Total Acreage	31.7 acres
Area 6, Richmond	Archaeological Areas	6a, 6b, 6c, 6d, 6e, 6f, 6g, and 6h
	Total Acreage	32.8 acres

Note: Revisions to the LOD during the course of fieldwork eliminated the need for archaeological survey in Archaeological Area 4a, so it is not discussed or addressed within these results. Source: Dovetail 2018

3 SURVEY METHODOLOGY

The goal of the archaeological survey was to identify any archaeological sites within the archaeological APE that are listed in or eligible for the NRHP. The survey methods employed to meet this goal were chosen with regard to the project's scope (i.e., the project's potential to affect significant resources, should they be present), the potential of the project area to contain significant resources, local field conditions, documented prior disturbance, the limits of previous Phase IB survey, and the results of prior predictive modeling of the APE.

3.1 PHASE IB ARCHAEOLOGICAL AREA SELECTION

As previously noted, the DC2RVA corridor has been the subject of ongoing cultural resource investigations from 2014 to present, including a Phase IA archaeological background review and archaeological predictive model (Klein at al. 2015) and a Phase IB archaeological survey of the mainline based on modeling (McCloskey et al. 2016). This previous Phase IB investigation examined the output locations from the predictive modeling efforts within the APE, defined at the time as 50 feet (15.2 m) on both sides of the center of the existing 123-mile (198-km) project corridor. This investigation found that the overwhelming majority of the APE was disturbed by buried utility corridors, modern development, and grading associated with the railroad. The field observations and results from this previous Phase IB investigation helped to inform the selection of areas warranting archaeological survey within the LOD of the Preferred Alternative, which serves as the APE for the current investigation. The results of this survey combined with additional locational and disturbance factors were used to select the areas subjected to Phase IB survey within the scope of this project and they include:

- Proximity and relative location to areas previously identified by predictive modeling to have high, medium, and low potential for archaeological deposits
- Proximity and relative location to previously recorded archaeological sites and battle-related architectural resources
- Location relative to the limits of the previous Phase IB APE
- Topography
- Location within utility corridors as defined from the previous Phase IB survey
- Modern disturbance noted on aerial imagery and documented during the previous Phase IB survey

These factors were analyzed and delineated during an intensive GIS-based desktop analysis of the Preferred Alternative LOD. The analysis rendered discrete locations throughout the length of the corridor that warranted archaeological survey within the scope of the current Phase IB investigation. These discrete locations were then grouped for ease of survey, as discussed in the following section (3.2 Archaeological Survey).

During the desktop review discussed above, it became apparent that certain locations along the corridor required additional historic map analysis. The predictive model developed by Klein et al. (2015) and implemented by McCloskey et al. (2016) consulted and incorporated historic maps which shaped the model development and thus were reflected in the output probability locations. To mirror this methodology, a variety of historic maps were georeferenced using GIS software and used to identify additional locations for archaeological survey in the Fredericksburg and Richmond areas of the APE. These locations were targeted for historic map analysis because the Preferred Alternative LOD extended well beyond the previous Phase IB APE and a multitude of map resources were available for analysis. Other historic locations considered but eliminated from analysis due to a lack of LOD modifications/track improvements outside the 2016 Phase IB APE (in that their historic map analysis was completed as part of the predictive model), were Ashland and Alexandria.

Historic maps consulted in Fredericksburg included Ferguson (1909), Gray (1878), and Sanborn Map Company (1886, 1891, 1896, 1902, 1912, 1919, and 1927). In Richmond maps georeferenced included Baist (1889), Bates (1835), Beers (1877), Ludwig (1865), Randal (1922), and Sanborn Map Company (1905). These maps were used to note areas within the APE that reflected a historical occupation and could yield intact archaeological deposits. Locations identified through this analysis were flagged for archaeological survey and in some locations, this analysis resulted in the identification of archaeological site boundaries, based purely on historic map projections.

3.2 ARCHAEOLOGICAL SURVEY

As previously discussed, locations within the six DC2RVA project areas were designated for archaeological survey through a review of modern aerial imagery, comparisons to DHR's site files, analysis of the Phase IA study and predictive model, and evaluating the results of the prior Phase IB survey. The locations indicated by this review, referred to as Phase IB archaeological areas, were given alphabetical letter designations within each of the larger six DC2RVA project segments. The archaeological areas were designated first by their DC2RVA area number and then by their lettered designation assigned as part of this study, for example Archaeological Area A in Area 2, Northern Virginia, is notated within this report as "2a". Shovel test pits (STPs) were excavated at 50-foot (15.2-m) intervals along transects across these Phase IB archaeological areas within the larger APE. Given the highly disturbed nature of the APE, judgmental shovel testing (shovel tests placed not on transect but judgmentally placed given field conditions) was also employed in order to maximize subsurface sampling and to verify subsurface integrity.

Each STP within the archaeological area was given a numerical designation. The provenience information for each STP included the archaeological area alphabetical designation, lettered transect designation, and the sequential numerical designation. For example, STP 2a-A-1 refers to the first STP on the first transect excavated within Area A of Area 2, Northern Virginia. STPs were not excavated in areas of obvious modern disturbance. STPs measured approximately 1.3 feet (38.1 cm) in diameter and were excavated to penetrate at least 0.3 feet (10.2 cm) into sterile subsoil where possible. Shovel test radials were excavated at 25-foot (7.6-m) intervals in cardinal directions from shovel tests that produced cultural materials.

All soils excavated from STPs were passed through 0.25-inch (0.6-cm) hardware mesh cloth. Each distinct soil horizon was given a stratum designation (e.g., I, II) in order to delineate stratigraphic relationships. All artifacts were recovered and bagged by stratum. The project name, area designation, transect, STP, stratum, excavator, date, and material recovered were recorded on field tags for each level. Soil conditions, weather information, and notations on disturbances were recorded in field notes.

Metal detector survey was carried out within the American Battlefield Protection Program's (ABPP) potential National Register (PotNR)-established boundaries of all Civil War battlefields that intersect the Phase IB archaeological areas within the APE. Additionally, judgmental metal detector survey was completed in areas deemed to have high probability for containing Civil War resources. This assessment of probability was based on the evidence of recent metal detecting activity by amateurs and other surface features identified during the pedestrian survey.

The metal detector surveys were only completed in areas deemed through pedestrian survey to have the potential for intact subsurface deposits and thus overlapped the STP survey transects within potential Civil War sites. The metal detector surveys were conducted by staff who have received specialized training in using metal detectors at Civil War sites, using a Fisher Gold Bug and a Tesoro Cibola metal detector. Metal detecting was conducted in a zig-zag pattern along transects spaced at 6-foot (1.8-m) intervals. The discriminating function of the metal detector was turned off and any positive contacts were identified with pin flags. The locations of all positive contacts were excavated to determine if the contact was positive for historic ferrous and/or non-ferrous metal artifacts. All contacts positive for artifacts were mapped and, if need be, were used to produce artifact distribution maps that show and discriminate between locations of military and non-military and possible dual use artifacts.

3.3 LABORATORY METHODS

Any archaeological specimens collected during the Phase IB survey were transported to Dovetail's laboratory in Fredericksburg, VA, for processing and analysis. Prior to artifact washing, each bag was cross-referenced with the field log to confirm provenience information and contents. Stable objects were washed with tap water and a soft brush with special attention paid to edges of ceramics and glass to better aid in identification. After washing, the artifacts were grouped by provenience and placed on a drying rack.

Once dry, the artifacts were cataloged for analysis. Specific characteristics were described using currently accepted terminology and were entered into an Access database. After cataloging, diagnostic artifacts were pulled and directly marked with their provenience information or accession number.

Specific ware types and manufacture dates were identified using Adams (2002), Bartoviks (1980), Greer (1970), Nelson (1968), Noël Hume (1991), Pittman et al. (1987), and South (1977). Non-tool prehistoric lithics were identified using Andrefsky (1998), Odell (2004), and Whittaker (1994). Hafted bifaces and prehistoric ceramics, if recovered, were assigned types using standard regional typologies (i.e., Coe 1964; Custer 1989; Ritchie 1971).

4 RESULTS OF ARCHAEOLOGICAL SURVEY

The archaeological areas subjected to Phase IB study, inclusive of pedestrian and subsurface testing, encompass 158.8 acres (64.3 ha). For purposes of this report, areas of archaeological testing will be described by their orientation to the existing rail, as that rail is oriented at the specific segment location in each area.

The following discussion first presents a general summary of the extensive disturbance noted throughout the APE. Following this discussion, the survey results from each area within the DC2RVA preferred alternative corridor are presented inclusive of location, noted disturbance, and general results. Within each segment description is a detailed presentation of the archaeological areas that warranted subsurface testing, and all of the identified sites are described in detail, including NRHP eligibility recommendations. Maps of archaeological areas surveyed within the APE are not presented within the body of this results section; instead these are presented in Appendix A. Also presented as appendices are the shovel test catalog (Appendix B), the artifact catalog (Appendix C), archaeological State Lands Permit (Appendix D), and newly recorded archaeological site forms (Appendix E).

The significance of each site within this survey was evaluated in relation to the NRHP eligibility criteria. Sites were evaluated in regards to Criterion A, for their association with events that have made a significant contribution to the broad patterns of our history; Criterion B, for their association with people significant in our nation's history; Criterion C, for their embodiment of the distinctive characteristics of a style, type, or period of construction; and Criterion D, for their potential to yield information important to our understanding of history or prehistory. The seven aspects of integrity (location, design, setting, materials, workmanship, feeling, and association) were also examined, as they pertain to subsurface deposits and particularly in relation to NRHP assessment under Criterion D.

4.1 DISTURBANCE

As expected within a project corridor that is so closely aligned with an existing major railroad corridor, the archaeological areas subjected to Phase IB survey within the DC2RVA corridor contained substantial portions in which subsurface archaeological testing was not warranted (for detailed photographs of disturbance within the corridor as a whole, see McCloskey et al. 2016). Substantial subsurface disturbance throughout much of the APE rendered systematic shovel testing unnecessary, impracticable, or unsafe (Figure 4-1). The single largest source of surface disturbance within the corridor is grading associated with the construction and maintenance of the existing railroad. A number of other disturbances are found repeatedly throughout the corridor, including buried utility transmission lines, access roads, and large areas of standing water.

Throughout the 123 miles (198 km) of the DC2RVA corridor, the track of the existing railroad and associated ballast are largely level, with their topographic relief varying only a few feet across the entire length of the corridor. The surrounding natural topographic relief, however, varies substantially, from the tops of significant hills to low lying areas near wetlands and streams. To maintain the largely level rail line through these topographic variances, a great deal of grading has been undertaken. Throughout the DC2RVA corridor, where the existing rail is substantially higher than the natural surface, a large artificial berm is required to carry the existing rail at its level. Where the rail needs to be lower than the natural surface, it has been cut through leaving high walled, steeply sloped embankments leading from the natural topography down to the rail bed. The entire width of the APE was often within these graded and thus artificially sloped areas. Although the width of the Preferred Alternative corridor often extends substantially further from the existing rail than the APE of the 2016 survey (McCloskey et al. 2016), these areas are often those in which the grading from the existing rail to the surrounding land is most extreme, and therefore even this wider corridor was largely disturbed by grading. Not only are these areas disturbed and susceptible to erosion, therefore not likely to contain intact cultural deposits, they are also in many cases so steep as to make any kind of subsurface testing entirely impracticable.

Outside of areas disturbed by grading for the existing railroad, the largest cause of disturbance in the DC2RVA archaeological APE is the presence of buried utility corridors. Petroleum pipelines and fiber optic cable parallel the existing railroad line on one or both sides and often are located within the APE. The prevalence of these buried utility lines precluded subsurface testing because of obvious safety reasons; additionally, conversations with utility marking personnel knowledgeable about those corridors indicated that their installation involved a great deal of subsurface disturbance/earth moving. The petroleum pipeline was described as occupying a trench that was cut approximately 20 feet (6.1 m) wide. It is important to note that there are many areas within the corridor, in which these buried utilities combine with other disturbances, in particular the construction and maintenance grading discussed above. As such, in many locations, multiple subsurface disturbances are evident and occupy the entire width of the APE.

Another source of substantial disturbance throughout the length of the DC2RVA corridor is the presence of standing water in the archeological APE. Whether as a result of natural streams or as a result of drainage from the existing rail corridor accumulating in low-lying or poorly drained areas, large portions of the areas identified for Phase IB study were covered in standing water. Standing water was present in areas not mapped as being within one of the numerous streams that lie in or near the DC2RVA corridor.

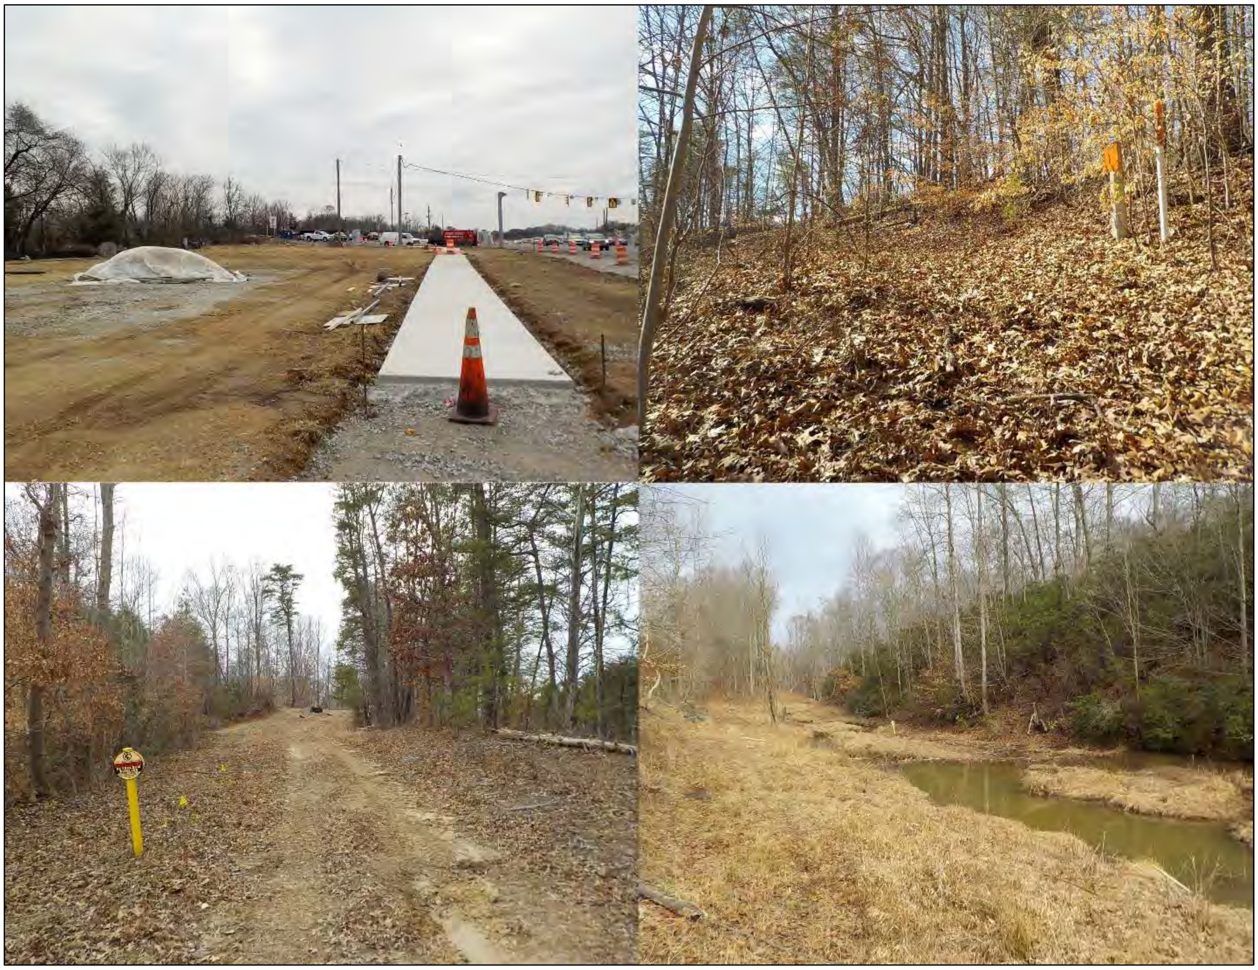

FIGURE 4-1: EXAMPLES OF COMMON DISTURBANCES NOTED THROUGHOUT THE APE (UPPER LEFT: UTILITY LINE CORRIDORS; UPPER RIGHT: STEEP SLOPES; LOWER LEFT ACCESS ROADS; LOWER RIGHT: STANDING WATER)

4.2 AREA 1: ARLINGTON

Area 1 of the DC2RVA archaeological APE is located entirely in the City of Arlington (see Figure 2-1). Extending less than 1 mile (1.6 km), Area 1 follows the existing rail line and runs through highly developed areas of Arlington adjacent to Ronald Reagan Washington National Airport. Analysis of the Preferred Alternative compared to the previous DC2RVA Phase IB survey, aerial photography, DHR records, and the predictive model from 2016 indicated no additional Phase IB survey was warranted in Area 1 as a result of previous disturbance (Figure 4-2).

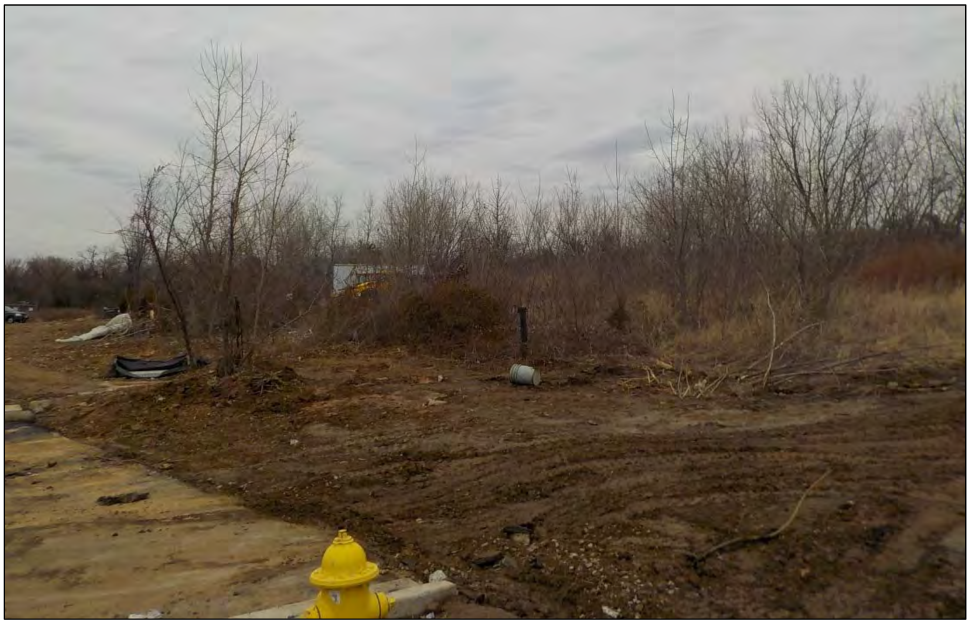

FIGURE 4-2: TYPICAL ENVIRONMENTAL SETTING IN AREA 1, LOOKING EAST

4.3 AREA 2: NORTHERN VIRGINIA

The Northern Virginia area of the Preferred Alternative encompasses those portions of the LOD lying within Arlington, Fairfax, and Prince William Counties, as well as part of the LOD within Stafford County (see Figure 2-1). Beginning in the north at the Arlington-Fairfax County Line, and ending in the south near Dahlgren Junction, approximately 1-mile (1.6-km) north of the Rappahannock River, Area 2 runs along approximately 47 miles (75.6 km) of the existing CSXT rail. The Area 2 archaeological APE encompasses 60.9 acres (24.6 ha) identified for archaeological survey.

The setting of the Northern Virginia segment is varied; however, most of the area consists of rolling terrain containing young deciduous forest with some stands of pine and varying degrees of grasses and brambles (Figure 4-3). Area 2 consists of 11 archaeological areas, lettered 2a through 2k, that were identified for Phase IB testing. Of these, Archaeological Areas 2a, 2b, and 2h required no subsurface testing as these areas were disturbed in their entirety. These areas were the subject of pedestrian survey and photo documentation only. The remaining eight archaeological areas were subjected to subsurface testing in at least some portions. A number of the archaeological areas are crossed by or adjacent to streams, including the Occoquan River and Marumsco, Farm, and Neabsco Creeks.

Like much of the DC2RVA project corridor as a whole, substantial portions of Area 2 were not subjected to subsurface testing due to existing soil disturbances. These disturbances mainly consisted of the grading and embankments required by the existing railroad. Other disturbances included substantial buried fiber optic and petroleum utility transmission lines, and artificial ditches.

FIGURE 4-3: REPRESENTATIVE VIEW OF AREA 2 SETTING, LOOKING NORTHEAST

The pedestrian survey within Area 2 identified a small family cemetery, recorded as site 44ST1224/089-5624. Subsequent subsurface testing in the area resulted in the excavation of 156 shovel tests in Area 2. Stratigraphy varied greatly across this area, as would be expected from such a small sample over such a large geographic area. Shovel testing produced no artifacts, but seven artifacts were uncovered by metal detecting and a single artifact by surface collection within the area, resulting in the identification of one site (44ST1223) and one isolated find (ISF 2e-1). Additionally, three previously recorded sites, 44PW1008, 44ST0270, and 44ST0271, not previously examined by prior DC2RVA Phase IB survey, intersect Area 2. All previously and newly recorded sites are discussed below general descriptions of the archaeological area within Area 2.

4.3.1 Archaeological Area 2a

Area 2a is made up of four small clusters of areas requiring archaeological study, three lying along the southern side of the existing CSXT rail line, in Fairfax County, approximately 1-mile (1.6-km) east of the interchange of Interstate Highways 95 (I-95) and 495 (I-495) in Springfield, and one lying on the eastern side of the rail, approximately 500 feet (152.4 m) north of Airport Access Road in the City of Arlington. All three clusters lie in an area that is extensively developed with suburban residential, commercial and industrial construction. Area 2a stretches across approximately 8.5 miles (13.7 km) of the proposed corridor, through an area where the rail is largely oriented east to west, though it does turn to the south at the far eastern end of Area 2a. The four areas within this distance, beginning with the northernmost respectively, are approximately 560 feet (170.6 m), 600 feet (182.9 m), 310 feet (94.5 m) and 290 feet (88.4 m) long, with the widest section reaching 80 feet (24.4 m). Archaeological Area 2a encompasses a total of 3 acres (1.2 ha). No subsurface testing was conducted within Area 2a, as the entire area was disturbed, lying mainly within substantial grade between the surrounding land and the existing railroad (Figure 4-4 through Figure 4-6). Disturbance was also caused by multiple buried utilities running through the project area (Figure 4-7 and Figure 4-8). No artifacts were found, and no sites were discovered.

4.3.2 Archaeological Area 2b

Archaeological Area 2b, in Fairfax County, is made up of two small strips of APE identified for archaeological study, located on the east side of the existing CSXT rail, immediately to the north of the Occoquan River. Spanning across a combined length of 700 feet (213.4 m), and with a maximum width of 40 feet (12.2 m), Archaeological Area 2b lies in a strip of land paralleling the existing rail that has been cleared for a petroleum pipeline. Archaeological Area 2b encompasses a total of 0.3 acres (0.1 ha) subjected to Phase IB archaeological survey. The area is relatively level in the north but begins to slope down towards the river as it extends to the south. No subsurface testing was conducted within Archaeological Area 2b, as the entire area was disturbed, with testing precluded by construction grading related to the existing rail, the large trench containing the petroleum pipeline, and the slope down to the Occoquan River (Figure 4-9). No artifacts were found and no new sites were discovered (Figure 4-10).

4.3.3 Archaeological Area 2c

Archaeological Area 2c is located in Prince William County, beginning just south of the Occoquan River, opposite from Area 2b. This area consists of six discrete sections of areas requiring archaeological study lying in two large clusters, one along the east side of the existing rail immediately south of the river and one at the intersection of the existing rail with Dawson Beach Road in Woodbridge. Area 2c, which is surrounded by residential and industrial areas of Woodbridge, contains a mixture of young deciduous wooded areas with substantial undergrowth and cleared areas, which generally contain utility corridors (Figures 4-11 through Figure 4-13). Area 2c spans slightly less than 1 mile (1.6 km) of the existing rail corridor, and the six irregularly shaped sections vary in size, encompassing a combined area of 5.1 acres (2 ha). Much of Area 2c was not subjected to subsurface testing because of disturbances during pedestrian survey. These disturbances included graded surfaces associated with railroad construction and petroleum pipeline facilities. However, two small portions within Area 2c were subjected to STP survey (Figure 4-14 and Figure 4-15). Eight STPs were excavated along three transects. No artifacts were found and no sites were discovered.

\\Dts2\Main Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

The average STP depth in Area 2c was 1.1 feet (33.5 cm) with a maximum depth of 1.6 feet (48.8 cm). A-horizon depths ranged from 0.3 feet (9.1 cm) to 0.9 feet (27.4 cm) with an average depth of 0.5 feet (15.2 cm). A representative profile has dark yellowish brown (10YR 3/4) silt loam overlying strong brown (7.5YR 5/8) silt loam subsoil mottled with 2.5Y 7/6 yellow clay loam (Figure 4-16).

4.3.4 Archaeological Area 2d

Archaeological Area 2d is located on the west side of the existing railroad, immediately to the north of Neabsco Creek, near its mouth at Occoquan Bay. Archaeological Area 2d consists of a single linear block, measuring approximately 930 feet (283.5 m) from north to south and 55 feet (16.8 m) across its greatest width, a total of 1.1 acres (0.4 ha). The setting of Archaeological Area 2d is typified by second growth woods with a variable understory of vines and brambles (Figure 4-17). Although approximately half of the width of Archaeological Area 2d was not subjected to subsurface testing due to disturbance from construction and maintenance grading for the existing rail, as well as a buried fiber optic line that parallels the rail, STPs were excavated through the entire length of the area within the narrow strip of undisturbed land on the edge of the area (Figure 4-18). Two transects totaling 36 STPs were initially designated for excavation in Archaeological Area 2d, but the entirety of the "A" transect was observed to be disturbed, leaving the single B transect of 18 STPs as the entirety of excavation (Figure 4-19). No artifacts were found and no sites were discovered.

\\Dts2\Main Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

The average STP depth in Area 2d was 1.1 feet (33.5 cm) with a maximum depth of 1.8 feet (54.9 cm). A-horizon depths ranged from 0.3 feet (9.1 cm) to 0.7 feet (21.3 cm) with an average depth of 0.5 feet (15.2 cm). Typical STP profiles in Archaeological Area 2d consisted of very dark brown (10YR 2/2) silty clay with coal and ash inclusions, overlying a sterile subsoil of strong brown (7.5YR 4/6) clay loam mottled with 10YR 7/1 light gray clay (Figure 4-20). The coal and ash inclusions noted in Stratum I likely originated from rail operations, from either freight or locomotive by-products, and were observed in the upper soil strata of many STPs in close proximity to the rail corridor.

FIGURE 4-20: REPRESENTATIVE SOIL PROFILE FROM AREA 2D, STP 2D-B-4

4.3.5 Archaeological Area 2e

Archaeological Area 2e lies adjacent to Leesylvania State Park on a wooded peninsula between Neabsco and Powells Creeks in Prince William County. Because Archaeological Area 2e is in close proximity to Leesylvania State Park and archaeological survey work was completed in an area along the CSXT/Park boundary, a DHR State Lands Permit was obtained to adequately assure that all parties were thoroughly informed of the archaeological survey work. All excavation was conducted in accordance with that permit which is included in Appendix D.

Archaeological Area 2e consists of three discrete blocks identified for archaeological study, all of which are linear and parallel the existing rail line. The three areas span across approximately 1 mile (1.6 km) of the existing corridor and measure a total of 13.8 acres (5.6 ha). The two blocks of survey located to the west, measure 2,700 feet (823.0 m) long and 1,700 feet (518.2 m) long, while the block on the east is 1,600 feet (487.7 m) long. All three blocks vary in width but tend to be approximately 100 feet (30.5 m) wide, with a maximum width of 130 feet (39.6 m). The environmental setting includes both wooded and maintained grassy areas and is generally gently sloping with isolated locations containing more substantial slope. The bulk of the area is disturbed, with gravel roads, buried pipelines and construction grading for the existing rail precluding subsurface testing in the majority of the three blocks of survey (Figure 4-21). However, small portions of each of the three blocks of survey were tested (Figure 4-22). In total, 22 STPs were excavated along four transects (Figure 4-23 and Figure 4-24). STP survey produced no artifacts, but a single artifact, a fragment of insulator glass, was recovered from the surface, collected, and designated ISF 2e-1. Isolated finds are, by definition, not eligible for NRHP listing.

04/2018

\\Dts2\Main\Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

The average STP depth in Area 2e was 1.0 feet (30.5 cm) with a maximum depth of 1.2 feet (36.6 cm). A-horizon depths ranged from 0.1 feet (3.0 cm) to 0.5 feet (15.2 cm) with an average depth of 0.3 feet (9.1 cm). A typical STP profile in Archaeological Area 2e consisted of dark yellowish brown (10YR 4/4) loam overlying dark yellowish brown (10YR 4/6) clay loam, which in turn capped yellowish brown (10YR 5/8) clay loam subsoil (Figure 4-25).

4.3.6 Archaeological Area 2f

Archaeological Area 2f consists of two blocks of survey, which encompass a total of 2.2 acres (0.9 ha), on the west side of the existing rail located just to the south of Powells Creek in Prince William County. Both study blocks parallel the existing rail, with the smaller, northern of the two measuring approximately 130 feet (39.6 m) in length and the southern extending for approximately 1,900 feet (579.1 m), covering an area measuring 2.2 acres (0.9 ha). Width varied constantly across the length of these areas, but the widest parts of the corridor were approximately 55 feet (16.8 m) across. Archaeological Area 2f was typified by a substantial slope running from east to west leaving only a narrow strip of level ground within the project area. Vegetation consisted of secondary growth forest with a substantial understory of vines and brambles. In much of Archaeological Area 2f only pedestrian survey was undertaken due to disturbance related to the road running through the area or to extreme slopes or erosion that rendered STP survey impractical (Figure 4-26), but STP survey was completed through the southern block of Area 2f (Figure 4-27). A total of 30 STPs was excavated along a single transect within Archaeological Area 2f (Figure 4-28 and Figure 4-29). No artifacts were recovered, nor were any features or new archaeological sites encountered. Archaeological Area 2f does intersect with previously identified site 44PW1008, discussed within the sites description section below the area descriptions.

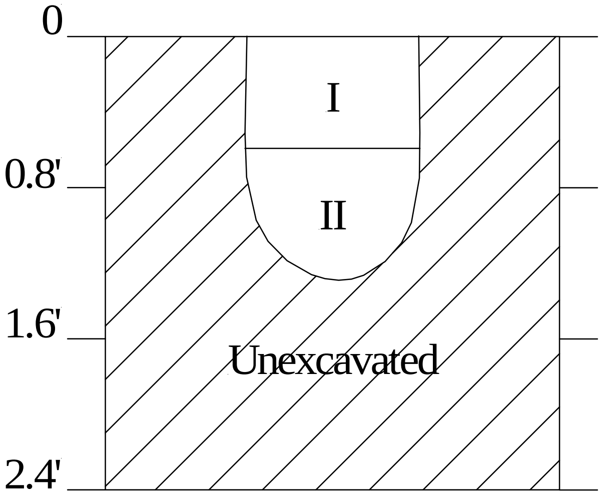
Figure 4-29
Survey Results in
Archaeological Area 2f
(Map 2 of 2)

04/2018

The average STP depth in Archaeological Area 2f was 0.9 feet (27.2 cm) with a maximum depth of 1.3 feet (39.6 cm). A-horizon depths ranged from 0.2 feet (6.1 cm) to 0.6 feet (18.3 cm) with an average depth of 0.4 feet (12.2 cm). STP profiles varied somewhat across the area, but a typical profile consisted of dark yellowish brown (10YR 3/4) silty sand with 10YR 7/1 gray degraded sandstone overlying gray (10YR 7/1) degraded sandstone bedrock (Figure 4-30).



Munsell:

I = Dark yellowish brown (10YR 3/4) with gray (10YR 7/1) degraded sandstone

II = Gray (10YR 7/1) degraded sandstone

FIGURE 4-30: REPRESENTATIVE SOIL PROFILE FROM AREA 2F, STP 2F-A-15

4.3.7 Archaeological Area 2g

Archaeological Area 2g, located in Prince William County, is situated in a wooded area just north of Aquia Creek. Consisting of two separate blocks of identified for Phase IB study, Area 2g lies entirely on the east side of the existing railroad. The northern block is very narrow, with a maximum width of a little over 10 feet (3.1 m) and a length of approximately 290 feet (88.4 m), while the southern block is wider, with a width of approximately 40 feet (12.2 m) and measuring 190 feet (57.9 m) in length. Archaeological Area 2g encompassed a total of 0.3 acres (0.1 ha) subjected to Phase IB archaeological survey. Archaeological Area 2g was generally typified by level topography and open older growth forest, and not as obviously subject to disturbance as much of the corridor. However, upon excavation of STPs, it became clear that the area had actually been subjected to substantial construction grading related to the existing railroad (Figure 4-31). Two STPs were excavated on two transects (Figure 4-32 and Figure 4-33). No artifacts were found and no sites were discovered.

Only two STPs were excavated in Archaeological Area 2g, and both showed substantial evidence of disturbance. The average STP depth in Area 2g was 1.2 feet (36.6 cm) with a maximum depth of 1.7 feet (39.6 cm). All soils above subsoil in both STPs were disturbed. A representative profile consisted of dark yellowish brown (10YR 3/4) silty clay overburden, overlying another layer of overburden made up of olive yellow (2.5Y 6/6) with dark yellowish brown (10YR 3/4) clay overlying yet another disturbed level consisting of dark brown (10YR 3/4) with reddish yellow (7.5YR 6/8) clay (Figure 4-34).

FIGURE 4-34: REPRESENTATIVE SOIL PROFILE FROM AREA 2G, STP 2G-A-1

4.3.8 Archaeological Area 2h

Archaeological Area 2h lies in Stafford County across Aquia Creek from Archaeological Area 2g and consists of eight small blocks of areas identified for archaeological study, dispersed across approximately 1.7 miles (2.7 km) on both sides of the existing CSXT rail line and comprising 4.1 acres (1.7 ha). These eight blocks contain a total length of approximately 3,700 feet (1,127.8 m), and vary in width, reaching a maximum width of approximately 110 feet (33.5 m). Archaeological Area 2g is situated generally in low lying areas with young deciduous forest, the entirety of which was disturbed and not suitable for subsurface survey (Figure 4-35 through Figure 4-37). Disturbance arose from erosion, the steep existing railroad, and buried utility lines (Figure 4-38). No artifacts were recovered and no sites were identified.

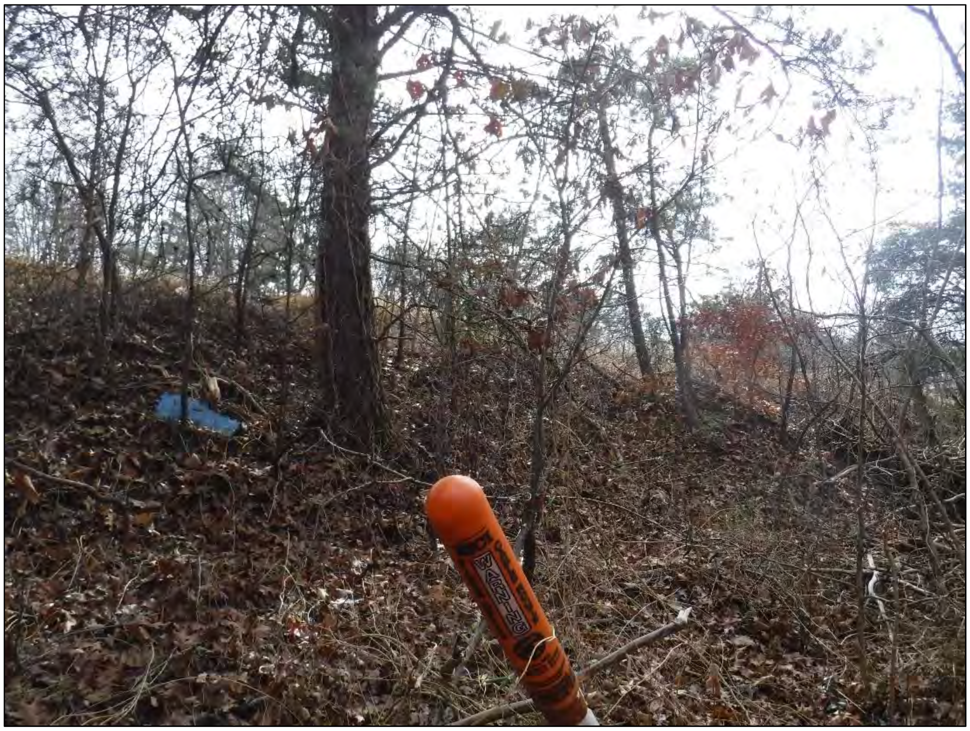

FIGURE 4-38: STEEP SLOPE AND DISTURBANCE FROM BURIED UTILITIES IN AREA 2H, LOOKING SOUTH

4.3.9 Archaeological Area 2i

Archaeological Area 2i is located in Stafford County near the Brooke VRE station. This area spans across approximately 1.8 miles (2.9 km) of the existing rail corridor beginning 0.6 miles (1.0 km) south of Courthouse Road and continuing to the crossing of Eskimo Hill Road over the existing rail. This archaeological area consists of 16 separate study blocks encompassing a total of 18.8 acres (7.6 ha) located both on the sides of the existing railroad and along Eskimo Hill Road. A large section located in the wooded area north of the existing rail extending from Union Camp Drive between Andrew Chapel Road and Mt. Hope Church Road was identified for Phase IB study, but was not tested because the landowners denied access. Settings varied across Area 2i and included open fields and yards as well as areas of secondary growth woods. Topography was typified by gentle slopes in less disturbed areas, and as elsewhere in the corridor, more extreme slopes near existing rail and road grading. Large portions of Archaeological Area 2i were disturbed by both road and rail construction, landscaping around residences, as well as buried utilities (Figure 4-39 and Figure 4-41). Fifty-Four STPs were excavated along 15 transects (Figure 4-42 through Figure 4-46). No artifacts were found and no sites were discovered.

4.3.10 Archaeological Area 2j

Archaeological Area 2j is located in Stafford County in a swath of woods located north of Potomac Creek, near Daffan. This archaeological area, located in a semi-rural area on the edges of the Fredericksburg suburbs, contains three separate blocks, two on the east of the existing rail and one on the west. These sections lie almost entirely within forests, but a cleared powerline corridor does cut across the area. Archaeological Area 2j encompasses a total of 1.5 acres (0.6 ha) of identified for Phase IB study. The natural topography of the area is gently sloping or level, but the extreme slope of the existing rail does cut through the areas identified for study. The entirety of the east side of the rails was disturbed by a petroleum pipeline corridor, but one of the sections on the west side was largely undisturbed allowing for STP survey (Figure 4-48). Five STPs were excavated along a single transect (Figure 4-49 and Figure 4-50). No artifacts were found and no sites were discovered.

FIGURE 4-51: REPRESENTATIVE SOIL PROFILE FROM AREA 2J, STP 2J-A-7

4.3.11 Archaeological Area 2k

Archaeological Area 2k begins directly across Potomac Creek from the end of Archaeological Area 2j. From there it follows the existing rail to the southwest, then curving to the west, before curving back to the southwest, ending approximately 2,000 feet (609.6 m) from the railroad's crossing of Primmer House Road. In addition to the sections that parallel the rail on both sides, Area 2k includes blocks deemed suitable for archaeological study that extend along Primmer House and Leeland Roads at their crossing with the existing rail. Composed of 18 separate blocks, Archaeological Area 2k encompasses 10.6 acres (4.3 ha). The majority of Area 2k lies within wooded locations, varying from relatively open older growth to young secondary growth with dense vines and brambles. Most of Area 2k is gently sloping, but the rolling natural topography occasionally becomes steeper, and the existing rails and roads through these slopes required substantial construction grading. These natural and artificial slopes precluded subsurface testing in much of Archaeological Area 2k, as did buried utility lines and eroded areas (Figure 4-52). Small Portions of Archaeological Area 2k were, however, suitable for subsurface testing (Figure 4-53). Twenty STPs were excavated on eight transects (Figure 4-54 through Figure 4-64). Metal detector survey was conducted in portions of Archaeological Area 2k based on the evidence of recent metal detecting activity by amateurs and other surface features identified during the pedestrian survey. These features were believed to be indicative of a Civil War era archaeological site and, as such, metal detecting was conducted.

No artifacts were recovered from the STPs in Archaeological Area 2k, but metal detector survey, undertaken when depressions were observed in the project area, recovered seven artifacts which resulted in the identification of site 44ST1223, a nineteenth-century historic site with a Civil War component. Additionally, two previously identified archaeological sites, 44ST0270 and 44ST0271, slightly overlap the project area within Area 2k. Also, pedestrian survey within Archaeological Area 2k identified a small family cemetery, recorded as site 44ST1224/089-5624. New and previously identified sites are discussed separately below the area descriptions.

\\Dts2\Main Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

The average STP depth in Archaeological Area 2k was 1.1 feet (33.5 cm) with a maximum depth of 1.5 feet (45.7 cm). A-horizon depths ranged from 0.1 feet (3.0 cm) to 0.6 feet (18.3 cm) with an average depth of 0.4 feet (12.2 cm). A representative profile consists of very dark grayish brown (2.5Y 3/2) silt loam topsoil, capping light yellowish brown (2.5Y 6/4) silty clay subsoil (Figure 4-65).

4.3.12 Previously Recorded Site 44PW1008

Site 44PW1008 is an archaeological site of indeterminate age or cultural affiliation in Prince William County (Figure 4-66). DHR site files record no notes of the associated site artifacts and indicate that the site is unevaluated regarding its NRHP eligibility. Most of the site as previously mapped lies outside the APE to the west. The APE within this site lies in a graded area between two artificial sloped surfaces, with push piles and dumped trash (Figure 4-67). Because of these artificial slopes, visual observation from the project corridor into the site was limited. However, to the extent that the site overlaps the present survey area, substantial disturbance is evident on the surface. Two STPs on the transect testing this portion of Archaeological Area 2f lie within the site boundaries. Both STPs had similar profiles consisting of a thin topsoil of dark yellowish brown (10YR 3/4) overlying gray (10YR 7/1) degraded sandstone. This is consistent with the area having been extensively graded. Because of the limited portion of the site lying within the project boundaries **it is recommended that site 44PW1008 remains unevaluated for the NRHP. However, within the archaeological APE, this portion of site 44PW1008 has been substantially disturbed and retains little soils that might retain archaeological deposits, and as such any portion of the site within the APE would not contribute to the site's overall eligibility**.

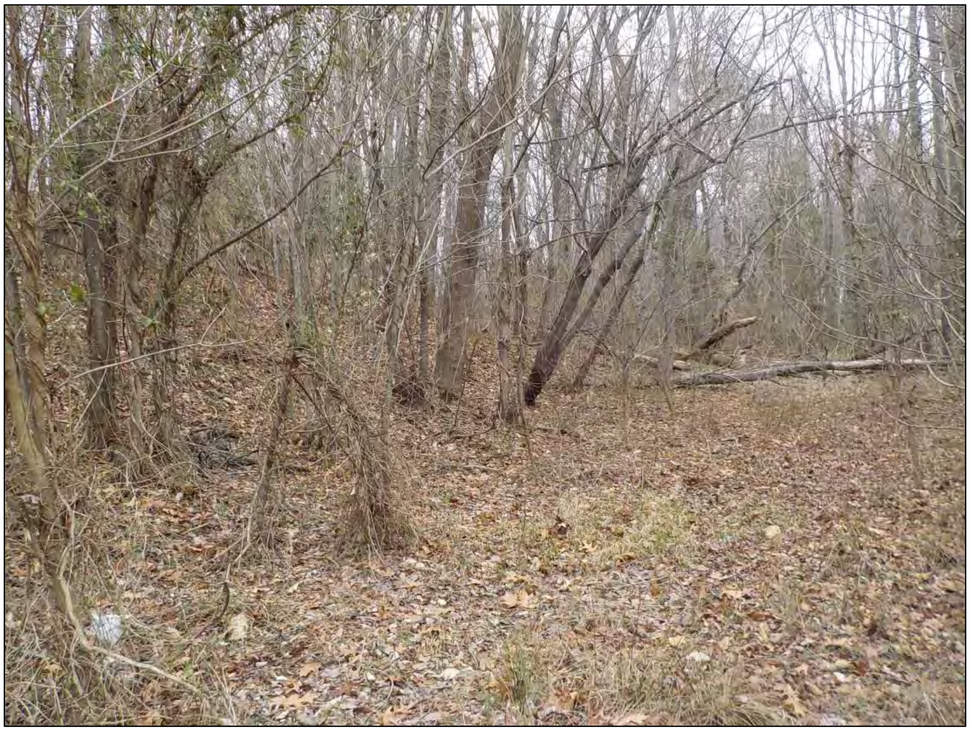

FIGURE 4-67: OVERVIEW OF SITE 44PW1008 WITHIN APE, LOOKING NORTH

4.3.13 Previously Recorded Site 44ST0270

Site 44ST0270, a reported Civil War camp, was identified to DHR by an informant who observed hut depressions in the area (Figure 4-68). The site has not been evaluated for NRHP eligibility. The substantial majority of the site lies outside the present survey area, and the portion that lies within the survey area is either on the extremely steep artificial slope up to Primmer House Road, or in the eroded area at the bottom of that slope (Figure 4-69). A pedestrian survey of the site indicated that no depressions or other visual indicators of the site were found intact within the project APE. It is therefore unlikely that any portion of the site within the current survey area remains intact, and given the nature of the site's initial recordation, may not have been part of the site core to begin with. **It is recommended that site 44ST0270 remains unevaluated for the NRHP. However, within the archaeological APE, the portion of site 44ST0270 has been extensively compromised by buried utilities and a gravel road, and as such any portion of the site within the APE does not contribute to the site's overall eligibility**.

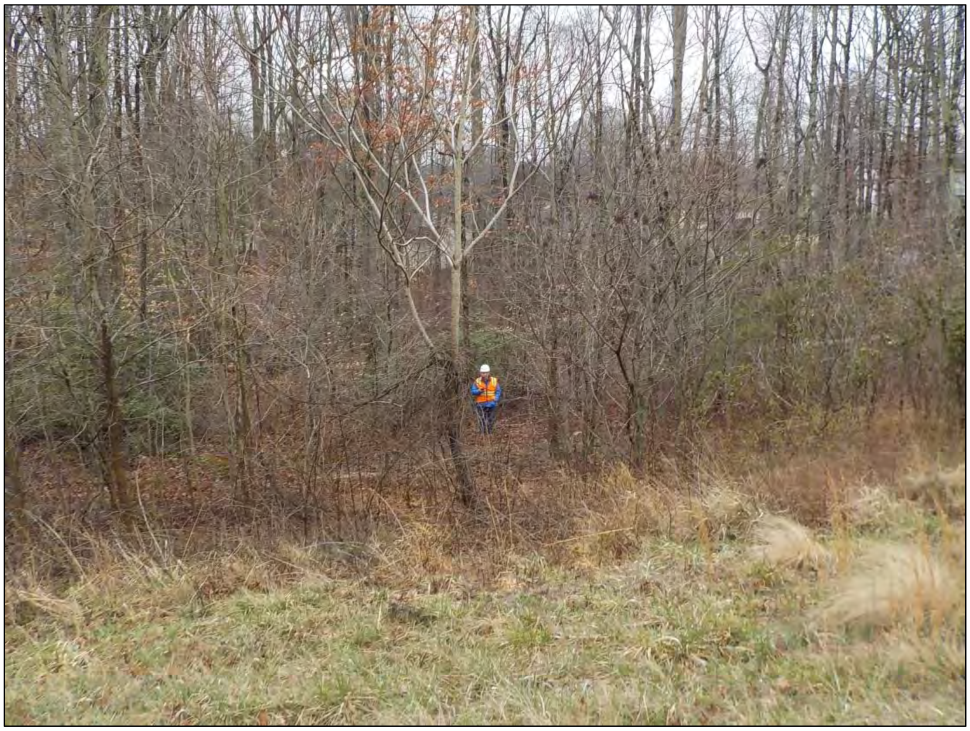

FIGURE 4-69: OVERVIEW OF SITE 44ST0270 WITHIN APE, LOOKING WEST

4.3.14 Previously Recorded Site 44ST0271

Site 44ST0271 is also an informant-identified Civil War camp (see Figure 4-68). DHR site files indicate that the site is unevaluated in regard to its NRHP eligibility. The substantial majority of the site as mapped lies outside the present survey area on private property to which Dovetail archaeologists did not have access. However, to the extent that the site overlaps the present survey area, the likelihood of undisturbed subsurface remains is low, as the area shows substantial erosion and disturbance relating to the existing rail line and a buried fiber optic line paralleling the rail (Figure 4-70). No depressions or other visual indicators of the site were found intact within the project APE. As such i**t is recommended that site 44ST0271 remains unevaluated for the NRHP. However, within the archaeological APE, the portion of site 44ST0271 has been substantially disturbed by both utility trenches and grading for the existing rail, and as such any portion of the site within the APE would not contribute to the site's overall eligibility**.

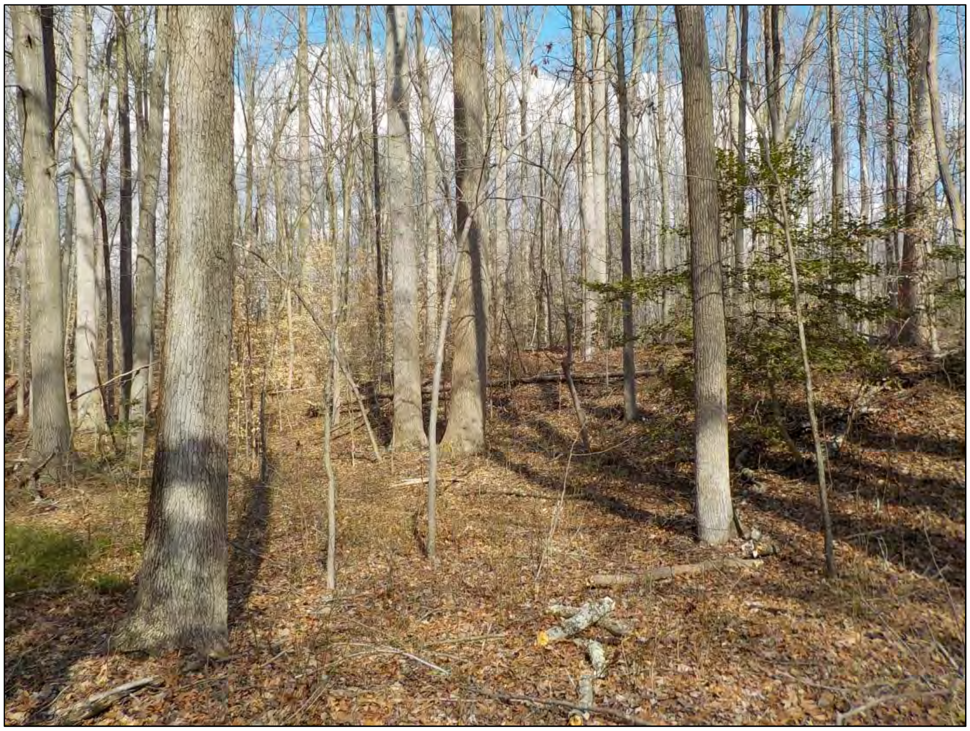

FIGURE 4-70: OVERVIEW OF SITE 44ST0271 WITHIN APE, LOOKING WEST

4.3.15 Newly Identified Site 44ST1223

4.3.15.1 Site Description

Site 44ST1223 is located in a wooded setting (Figure 4-71) on the north side of the CSXT rail line, just east of Primmer House Road, more specifically, within the central portion of Archaeological Area 2k (see Figure 4-68). This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters. The site was initially identified during the pedestrian survey based on the presence of two square depressions measuring approximately 3-foot (0.3-m) square, representing 'hut holes' (areas where soldier's winter tents were located) as well as recent metal detecting activity. These features were roughly linear in nature, however given only two were identified an exact layout is difficult to ascertain. While shovel testing resulted in no cultural materials, a cursory metal detector sweep of the archaeological APE was conducted to further delineate the portion of the site within the project limits.

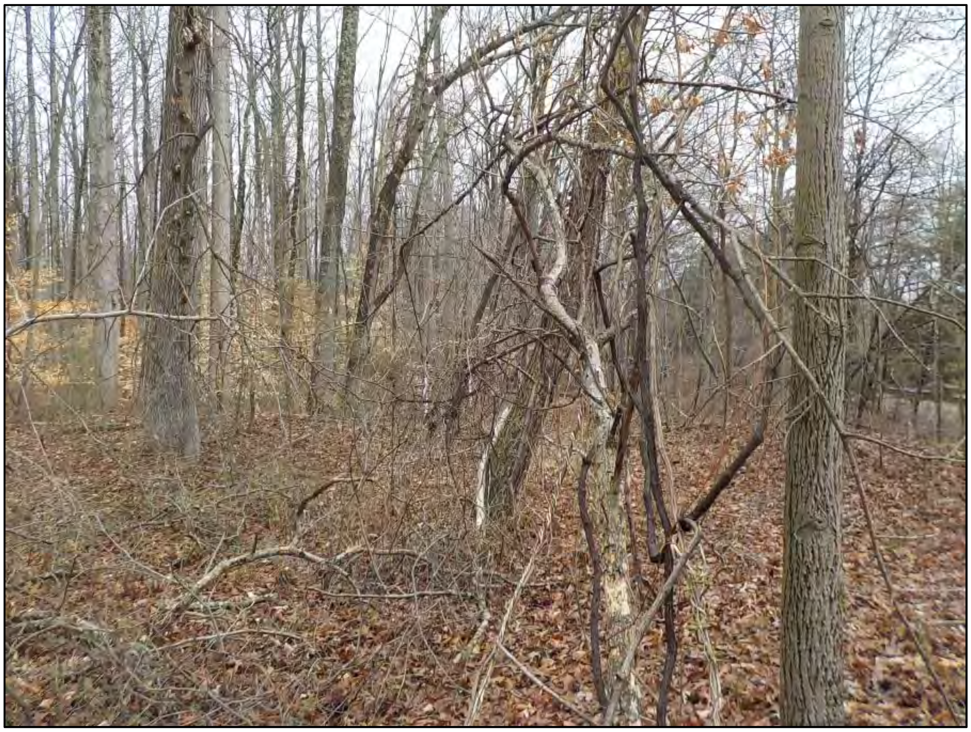

FIGURE 4-71: GENERAL VIEW OF SITE 44ST1223, LOOKING NORTHWEST

Much of the area is disturbed from logging, access roads, and buried utility lines which appear to have impacted a portion of the site. Due to property access limitations, only a portion of the site was investigated; however, additional hut holes were observed on a neighboring parcel. The portion of the site investigated during this survey measures approximately 223 feet (67.9 m) x 54 feet (62.4 m), covering an area of 0.2 acres (0.08 ha). It sits at an elevation of approximately 185 feet (56 m) above mean sea level (AMSL).

A total of seven artifacts was recovered from six metal detector hits at site 44ST1223, all representing the historic occupation of the site. Materials recovered include cut nails, barrel banding, and a broken horseshoe. While these artifacts could also represent a historic domestic occupation, the presence of hut holes and recent metal detectorist activity indicates this site represents a Civil War-era winter encampment. Furthermore, discussions with local metal detecting amateurs suggest that this site was occupied by the elements of the Third Corps during the winter of 1862–1863, and several Union and Confederate-related artifacts have been recovered from the general vicinity in the past.

The average depth of STPs within the site was 0.9 feet (0.3 m), with the deepest STP extending to a depth of 1 foot (0.3 m). The average A-horizon measured 0.47 feet (0.1 m). The maximum A-horizon measurement within the site was 0.6 feet (0.2 m). An average soil profile for this site contained two stratigraphic levels. Stratum I, consists of a very dark grayish brown (2.5Y 3/2) silt loam which overlaid a subsoil consisting of a light yellowish brown (2.5Y 6/4) clay loam (Figure 4-72).

II = Light yellowish brown (2.5Y 6/4) clay loam

FIGURE 4-72: REPRESENTATIVE STP PROFILE FOR SITE 44ST1223

4.3.15.2 Evaluation and Significance

Site 44ST1223 is a nineteenth century Civil War encampment occupied during the winter of 1862–1863. Excavations at the site resulted in little cultural material specific to the Civil War occupation of the site, but surface evidence indicates that features related to hut holes are present. While this site is tied to the Civil War, specifically when the Union Army went into winter quarters, this is not considered a significant historical event or pattern of events as Civil War winter encampments are found throughout this portion of Virginia (Criterion A) and, as such, Criterion A is not applicable. Additionally, there are no known associations with significant persons (Criterion B) and the deposits do not illustrate distinctive characteristics of a type, period, or method of construction (Criterion C). Furthermore, nearly 100 sites of this type have been identified in Stafford County alone, approximately 20 of which were subjected to a Phase II evaluation (i.e. Brady et al. 2004; Klein et al. 2007) and would be more applicable for Criterion C.

However, the presence of above-ground remains representative of Civil War features and the recovery of artifacts representing the nineteenth century Civil War occupation of the site suggests that further excavation at the site has the potential to yield significant data about the nineteenth century occupation of the area (Criterion D). As such, Dovetail **recommends site 44ST1223 as potentially eligible for NRHP listing, under Criterion D.**

4.3.16 Newly Identified Site 44ST1224

4.3.16.1 Site Description

Site 44ST1224/089-5624 is a small mid-nineteenth century family cemetery, known as the Daffan Cemetery, located in densely wooded portion of Archaeological Area 2k (Figure 4-73 and Figure 4-74). The cemetery is on the north side of the CSXT rail line and south of Leeland Road, situated approximately 6 miles (9.7 km) northeast of Falmouth, Virginia, in Stafford County. The site was identified during the pedestrian survey and no shovel tests were excavated within the cemetery area. The site measures approximately 35 x 40 feet (10.7 x 12.2 m), covering an area of 0.04 acres (0.02 ha). It sits at an elevation of approximately 130 feet (39.6 m) AMSL.

FIGURE 4-74: SITE 44ST1224/089-5624, LOOKING NORTH

Surface features noted at the site include five headstones, one associated footstone, and at least three unmarked interments. The first headstone reads "IN / *Memory of* / WILLIAM DAFFAN / DIED / April 2nd, 1855/in the 78th year of / His age." The marker is sandstone and has an unmarked associated sandstone footstone (Figure 4-75). The second headstone, also sandstone, has an engraved circle thought to contain an angel and reads "In memory of" (the rest of the text is buried) (Figure 4-76). The third sandstone marker has been damaged and is represented by detached top half and the bottom half which remains in its original location. The detached top half is decorated with a rose and reads "In memory of". The in situ base bears the inscription "…ANN M. / BURRUS/ WIFE OF P. H. BURRUS / Caroline County/ Who died / November 22nd 1848 / 29th year of her age." (Figure 4-77). The fourth headstone is also sandstone and reads "IN / *Memory of* / HUGH W. DAFFAN / DIED / Sept, 22. 1847 / In the 11 year / of his age." (Figure 4-78). The final headstone is granite and has no discernible inscription (Figure 4-78).

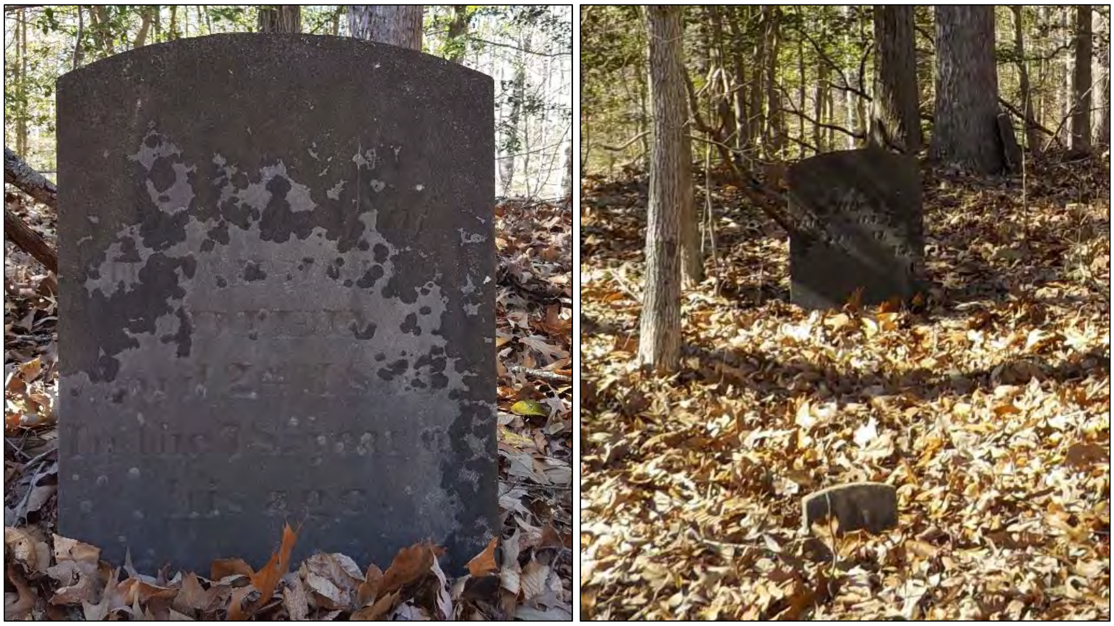

FIGURE 4-75: SITE 44ST1224, WILLIAM DAFFAN HEADSTONE DETAIL

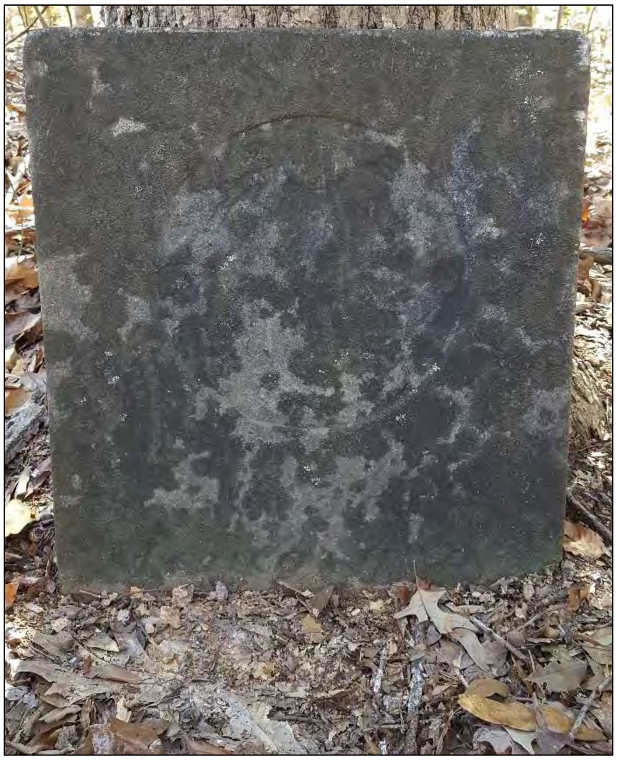

FIGURE 4-76: SITE 44ST1224, UNKNOWN HEADSTONE DETAIL

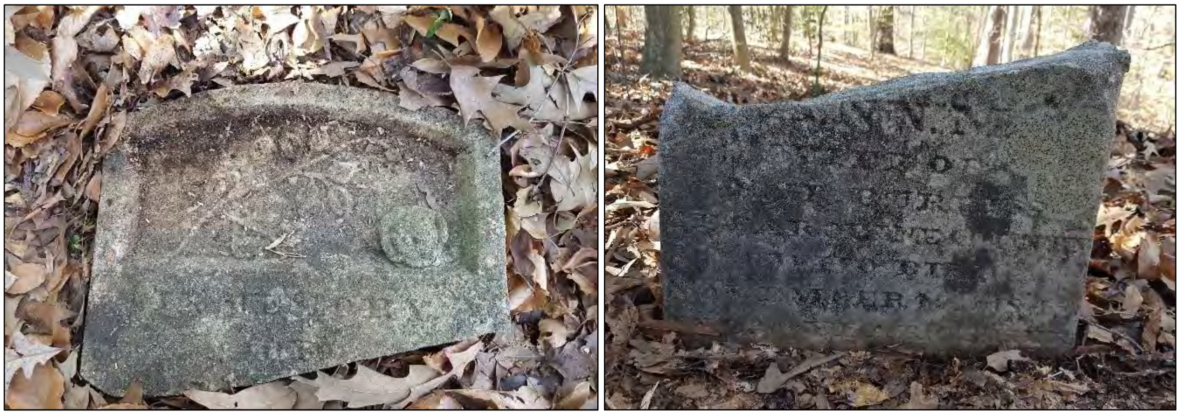

FIGURE 4-77: SITE 44ST1224, ANN M. BURRUS HEADSTONE DETAIL

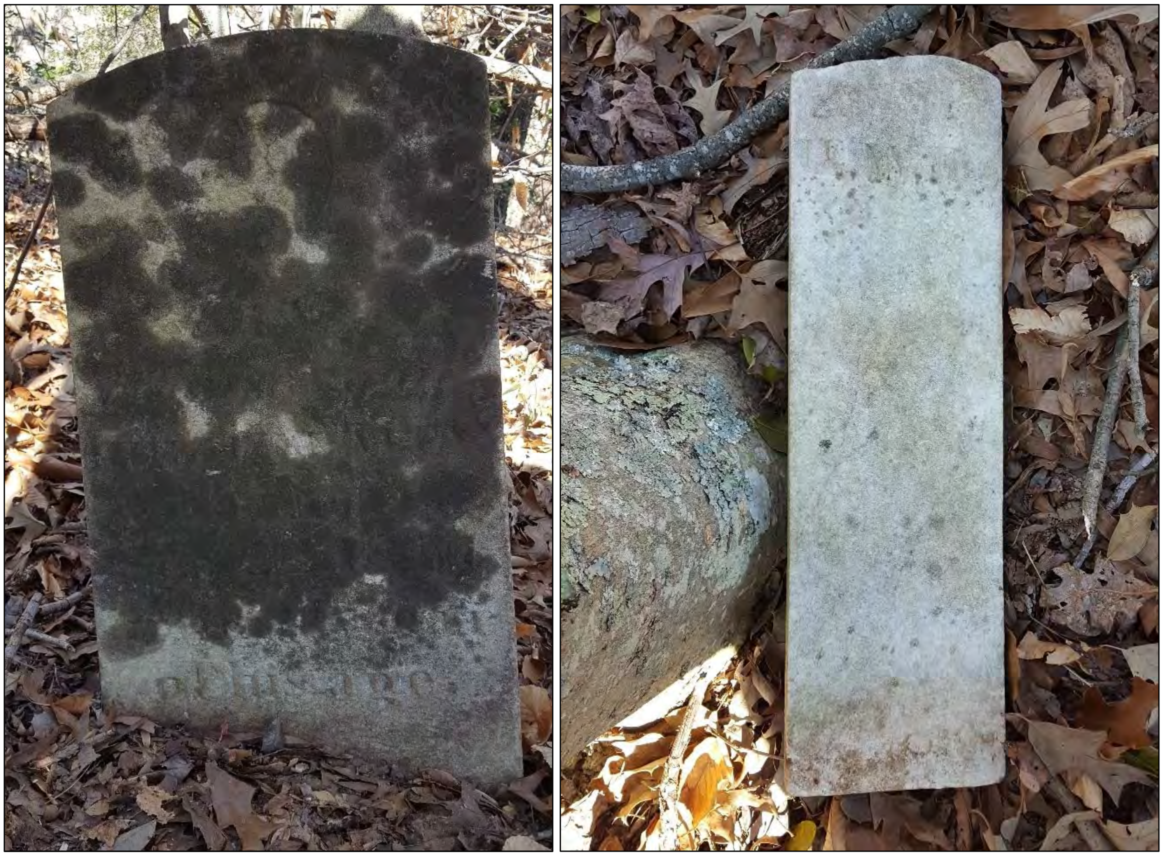

FIGURE 4-78: SITE 44ST1224, HUGH W. DAFFAN HEADSTONE DETAIL (LEFT) AND UNKNOWN HEADSTONE DETAIL (RIGHT)

In addition to the marked interments, at least three additional unmarked graves were noted during the pedestrian survey of the cemetery area. These unmarked interments were identified based on the presences of shallow rectangular depressions. Based on the presence of both marked and unmarked graves, it appears that a minimum of eight individuals may be buried within the cemetery. Given the interment dates on the discernible grave markers, the cemetery was established circa 1847 and abandoned circa 1855, suggesting it was in use for a very short period during the mid-nineteenth century. The Stafford County Cemetery Committee completed a survey of the cemetery in April 2009 and noted similar conditions and the presence of at least seven graves (both marked and unmarked) (Dodd 2009). This 2009 survey noted that the cemetery was threatened by neglect and that at least one grave had been disturbed and damaged.

4.3.16.2 Evaluation and Significance

Site 44ST1224/089-5624 is a small mid-nineteenth-century family cemetery, including the marked interments of five individuals and at least three unmarked graves. No subsurface excavations were conducted within the cemetery area, as such the boundaries of the cemetery have not been delineated. The cemetery appears to be typical of small family burying grounds encountered throughout the region and does not display any unique architectural elements or known association with people or events important in history. As such, **it is recommended that site 44ST1224/089-5624 is not eligible for NRHP inclusion under Criteria A–D.** However, it is recommended that the general cemetery area should be avoided or further delineation efforts should be undertaken to determine the exact limits of the cemetery.

4.4 AREA 3: FREDERICKSBURG

Area 3 of the DC2RVA Preferred Alternative encompasses those portions of the LOD lying within a part of Stafford County, and the City of Fredericksburg and Spotsylvania County in their entirety. A very small portion of Area 3 extends into Caroline County with the final archaeological area terminating approximately 800 feet (243.8 m) south of the Spotsylvania-Caroline County line. Beginning in the north near Dahlgren junction and ending on the south between Claiborne and Guinea, Area 3 runs along approximately 13 miles (20.9 km) of the existing CSXT rail. The areas identified for archaeological survey within Area 3 encompasses 29.5 acres (11.9 ha).

The setting of Area 3 is varied, running directly through downtown Fredericksburg and the local environs, but continuing into the rural areas to the southeast of the city. The northern portions of Area 3 reflect the urban environment around Fredericksburg, and as the corridor moves further to the south, the setting transitions to one dominated by wooded areas. (Figure 5-29). Area 3 consists of six archaeological areas, lettered 3a through 3f, designated for Phase IB study within the scope of the current investigation. One of these, Archaeological Area 3e, was inaccessible at the time of field survey and no pedestrian or subsurface archaeological investigations were completed in this area. The remaining five archaeological areas were subjected to subsurface testing in at least some portions. A number of the archaeological areas are crossed by or adjacent to streams, including the Rappahannock River, and Deep Run and Massaponax Creeks (see Figure 2-2).

Like much of the DC2RVA project corridor as a whole, substantial portions of Area 3 were not subjected to subsurface testing due to existing disturbances. These disturbances mainly consisted of the construction grading creating embankments required by the existing railroad. Other disturbances included substantial buried fiber optic and petroleum utility transmission lines and artificial ditches. Although the majority of area within Area 3 was disturbed and therefore not subjected to subsurface testing, five archaeological areas received at least some subsurface testing (Figure 4-79).

FIGURE 4-79: REPRESENTATIVE VIEW OF AREA 3 SETTING, LOOKING NORTHEAST

A total of 199 shovel tests was excavated in Area 3. Stratigraphy varied greatly across this area, as would be expected from such a small sample over such a large geographic area. Eight positive shovel tests and a single metal detector hit resulted in the identification of two new archaeological sites (44SP0767 and 3f-2) and two isolated finds (ISF 3c-1 and ISF 3f-1). Additionally, five previously recorded archaeological sites intersect Area 3 and were revisited during the current survey (44SP0187, 44SP0468, 44SP0687, 44SP0688, and 44ST0011). Artifacts were recovered from only one of these previously identified sites, 44SP0187. Newly and previously identified sites and ISFs are discussed below a general description of each area.

4.4.1 Archaeological Area 3a

Archaeological Area 3a begins at the existing CSXT railroad’s crossing of Kings Highway (Route 3), and continues from there to the southwest, ending at the Rappahannock River, and spanning across approximately 2,400 feet (731.5 m). Archaeological Area 3a consists of eight blocks of area deemed suitable for archaeological study that are located on both sides of the existing rail and running along the sides of Kings Highway. These areas encompass a total of 8.1 acres (3.3 ha). The majority of this area is not suitable for subsurface testing as the corridor falls largely in the extensive construction grading related to both the railroad as it approaches a bridge crossing the Rappahannock River, and to the multi-lane overpass of Kings Highway over the railroad (Figure 4-80). A small portion of Archaeological Area 3a, lying primarily along the western side of the rail, was tested via STP survey, but even there, many shovel test locations were left unexcavated as construction grading or inundation protrude across the transects (Figure 4-81). Twenty-one STPs were excavated and were located primarily on two transects, but a pair of judgmental STPs was excavated as well (Figure 4-82 and Figure 4-83). No artifacts were found and no new sites were identified in Archaeological Area 3a. However, previously identified site 44ST0011 intersects the APE in this area.

\\Dts2\Main Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

The average STP depth in Archaeological Area 3a was 1.3 feet (39.6 cm) with a maximum depth of 3.0 feet (91.4 cm). A-horizon depths ranged from 0.1 feet (3.0 cm) to 2.0 feet (61.0 cm) with an average depth of 0.6 feet (18.3 cm). A typical shovel test profile in Archaeological Area 3a consisted of dark grayish brown (10YR 4/2) sandy loam overlying dark yellowish brown (10YR 4/6) sandy loam, which sat atop brownish yellow (10YR 6/8) sand subsoil (Figure 4-84).

FIGURE 4-84: REPRESENTATIVE SOIL PROFILE FROM AREA 3A, STP 3A-D-7

4.4.2 Archaeological Area 3b

Archaeological Area 3b is a small area located in the downtown area of the City of Fredericksburg. Area 3b consists of a single block of survey area in a grassy level field to the south of the existing rail, overlooking the Rappahannock River. Measuring approximately 180 feet (54.9 m) long and 40 feet (12.2 m) wide, Area 3b extends from the river bank to the edge of Sophia Street, encompassing 0.2 acres (0.8 ha) identified for archaeological survey. Enough of Area 3b was undisturbed that subsurface testing was feasible through its entire length, but disturbances from the railroad construction and from buried utilities were present (Figure 4-85 and Figure 4-86). Subsurface testing in Archaeological Area 3b consisted of the excavation of four STPs along a single transect as well as metal detector survey, as Area 3b overlaps the PotNR boundaries for Battle of Fredericksburg I (111-5295), Battle of Fredericksburg II (111-5296), and the Salem Church Battlefield (088-5181). All four STPs were positive, and this finding and a metal detector hit resulted in the expansion of previously identified site 44SP1087 (Figure 4-87). These results, including notes on soil stratigraphy, are discussed below as they relate to site 44SP1087. Additionally, the APE in Archaeological Area 3b crosses previously recorded archaeological sites 44SP0687 and 44SP0688, which were examined as part of the study.

4.4.3 Archaeological Area 3c

Archaeological Area 3c consists of six blocks that were part of the archaeological study lying along Lansdowne Road near its intersection with the existing CSXT rail, and one additional strip of testing along the east side of the rail, to the north of Lansdowne Road. The surrounding setting of Archaeological Area 3c is dominated by commercial and light industrial development. In general the setting of the studied areas within Archaeological Area 3c corresponds to this development, lying in level graded, mowed areas surrounding commercial facilities. However, portions of Archaeological Area 3c lie in areas of secondary growth woods. The seven blocks making up Archaeological Area 3c total 3.4 acres (1.4 ha). Although substantial disturbance was present within the area, five of the seven sections had sufficient undisturbed areas as to allow for subsurface testing (Figure 4-88 and Figure 4-89). Subsurface testing in Archaeological Area 3c consisted of 43 STPs aligned on nine transects (Figure 4-90 through Figure 4-92). A single positive STP resulted in the identification of an isolated find, ISF 3c-1, a fragment of prehistoric quartz debitage. Isolated finds are by definition not eligible for NRHP listing.

The average STP in Archaeological Area 3c reached a depth of 1.0 feet (30.5 cm) with the deepest STP extending to 1.8 feet (54.9 cm). A typical STP profile consisted of dark yellowish brown (10YR 4/4) clay loam topsoil which sat above strong brown (7.5YR 5/6) clay subsoil with pockets of brownish yellow (10YR 6/8) clay (Figure 4-93).

FIGURE 4-93: REPRESENTATIVE SOIL PROFILE FROM AREA 3C, STP 3C-D-2

4.4.4 Archaeological Area 3d

Archaeological Area 3d is a small area lying entirely on the steep slope lying between a curve in the existing CSXT rail and the Fredericksburg and Spotsylvania National Military Park (111-0147). Archaeological Area 3d measures 425 feet (129.5 m) long and has a maximum width of 55 feet (16.8 m) encompassing an area of 0.4 acres (0.2 ha) on the west side of the existing rail. The area is entirely covered in young mixed woods with an understory of greenbrier and brambles, and is generally characterized by steep slope, though a narrow relatively level area was present allowing for a transect of STPs which ran the entire length of Area 3c (Figure 4-94). A total of eight STPs was excavated (Figure 4-95). In addition to STP survey, metal detector survey was conducted within Archaeological Area 3d, as it overlaps the PotNR boundaries for the Battle of Fredericksburg I (111-5295) and the Battle of Fredericksburg II (111-5295). No artifacts were found and no new sites were discovered. However, the majority of Archaeological Area 3d lies within the mapped boundaries of previously identified site 44SP0468 (see site description below).

The average STP in Archaeological Area 3d reached a depth of 1.0 feet (30.5 cm), with the deepest extending to 1.2 feet (36.6 cm). A-horizon soils in 3d ranged from 0.3 feet (9.1 cm) to 0.8 feet (24.4 cm) with an average depth of 0.6 feet (18.3 cm). STP profiles generally consisted of dark yellowish brown (10YR 4/4) silt loam topsoil overlying yellow (10YR 7/8) silt loam subsoil (Figure 4-96).

FIGURE 4-96: REPRESENTATIVE SOIL PROFILE FROM AREA 3D, STP 3D-A-1

4.4.5 Archaeological Area 3e

Archaeological Area 3e is located on the east side of Benchmark Road, which parallels the east side of the existing rail, running north to south across a length of 650 feet (198.1 m). The area includes two blocks identified for archaeological study and encompasses 0.6 acres (0.2 ha). This area is situated within a residential zone, south of Fredericksburg. At the time of survey Benchmark Road within Area 3a was closed for road construction, as such archaeological survey crews were not permitted to enter the area. Based on the inability to access Archaeological Area 3e, no pedestrian or subsurface archaeological investigations were completed in this area (Figure 4-97). No artifacts were found and no sites were discovered.

4.4.6 Archaeological Area 3f

Archaeological Area 3f is a long section of the LOD containing eight separate blocks including sections to both the east and west of the existing CSXT rail. Archaeological Area 3f begins approximately 3,000 feet (914.4 m) south of Mills Drive (U.S. Highway 17) near Olive in Spotsylvania County, and continues along the rail spanning approximately 4 miles (6.4 km) of the rail corridor, and encompassing a total of 16.9 acres (6.8 ha). The topography within Archaeological Area 3f consists generally of ridgetops and slopes, and is largely wooded with cleared areas for utility corridors as well as the unmaintained path of Benchmark Rd along the eastern side of the rail. North of Summit Crossing Road, STP survey was possible through much of the survey sections (Figure 4-98). However, the portions of Archaeological Area 3f south of Summit Crossing Road are typified by extensive construction grading resulting from the existing CSXT rail line as well as disturbance and erosion from the access roads and utility lines paralleling the existing rail line. Additionally, the intersection of those eroded areas with the numerous creeks crossing low lying spots within the area led to the inundation of substantial portions of the corridor. As such, work completed Archaeological Area 3f south of Summit Crossing Road included only pedestrian survey, no subsurface investigations were undertaken (Figure 4-99). Subsurface testing in Archaeological Area 3f included 124 STPs on 14 transects (Figure 4-100 through Figure 4-109). Three positive STPs produced a total of seven historic artifacts, which together with the observations made during pedestrian reconnaissance resulted in the identification of two new archaeological sites and one isolated find. ISF 3f-1 consisted of a cut nail and a bottle glass fragment of indeterminate manufacture. Isolated Finds are, by definition, not eligible for NRHP listing. Sites 44SP0767 and 3f-2 are discussed in detail below the area descriptions.

\\Dts2\Main Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 04.23.2018

STPs excavated in Archaeological Area 3f reached an average depth of 0.9 feet (27.4 cm) with the deepest reaching 2.0 feet (61.0 cm). A-horizon soils averaged 0.3 feet (9.1 cm) deep, reaching a maximum of 2.0 feet (61.0 cm) in depth. A typical STP profile in Area 3f consisted of a topsoil of black (10YR 2/1) sand with humus, overlying dark yellowish brown (10YR 4/4) sand, which in turn overlay brownish yellow (10YR 6/8) sandy clay subsoil (Figure 4-110).

4.4.7 Previously Recorded Site 44ST0011

Site 44ST0011 is a multicomponent site lying within the overall boundary of Ferry Farm (089-0016) (Figure 4-111). This site, identified primarily as a prehistoric site but including colonial elements, has not been evaluated in regard to its NRHP eligibility. The majority of the site as mapped lies outside the present survey in an open field to the southwest of the wooded survey area. However, to the extent that the site overlaps the present survey area, it lies in a sloping eroded area lying at the base of the railroad bridge crossing the Rappahannock River to the south (Figure 4-112). As the bulk of the site lies outside the project corridor in a field toward which visibility was limited from the project corridor, the site integrity as a whole cannot be assessed. However, based on the Phase IB study, the portion of the site within the APE was found to be heavily disturbed by erosion from an ephemeral drainage leading to the Rappahannock River. Of the approximately 50,000 square feet (4,645. 2 sq. m) encompassed by the site as a whole, less than 2 percent of the area lies within the APE. As such i**t is recommended that site 44ST0011 remains unevaluated for the NRHP. However, within the archaeological APE, the portion of site 44ST011 has been substantially disturbed, and as such any portion of the site within the APE would not contribute to the site's overall eligibility**.

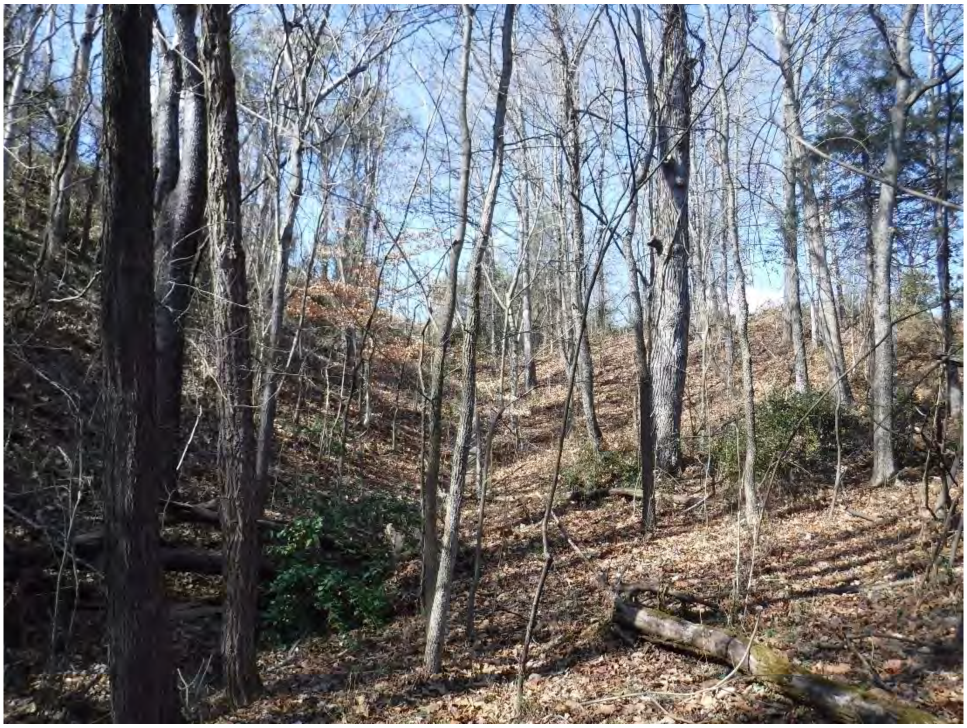

Figure 4-112: Overview of Portion of 44ST0011 Lying Within the APE, Looking North

4.4.8 Previously Recorded Site 44SP0187

4.4.8.1 Site Description

Previously recorded site 44SP0187 is located in a portion of Archaeological Area 3b that was identified for additional archaeological study (see Figure 4-111). As recorded at the DHR, the site is a nineteenth-century cut stone bridge pier on the south bank of the Rappahannock River, east of Sophia Street in Fredericksburg. Site 44SP0187 was visited during the 2016 Phase IB archaeological survey focused on the rail mainline (McCloskey et al. 2016). Expansions to the LOD as a result of the final EIS planning and design work required Phase I survey within additional portions of the site and gave archaeologists a better window into the site deposits and stratigraphy.

As noted by McCloskey et al. 2016, the DHR archives record site 44SP0187 as the remains of a bridge based on the observation of a cut-granite pier at the water's edge during low tide. McCloskey et al. noted the site location likely represented the remains of a mill operation that had been replaced by a series of industrial plants over time as well as several incarnations of the railroad bridge. As such, it was postulated that the site likely includes the remains of several buildings and structures; however, no subsurface testing was conducted at that time based on the limits of APE.

During the current survey, no cut stone was observed in the river, so although classified as a nineteenth-century bridge, the terrestrial portion of site 44SP0187 occupies the location of Marye's Mill, depicted in an 1863 photograph taken during the Second Battle of Fredericksburg and mills identified on Gray's (1878) map of late-nineteenth-century Fredericksburg (Hennessy 2011;

Figure 44). The mill extends inland from the river's edge to the ridge top along Sophia Street in all cases. In addition, the 1856 *Bird's Eye Views of Fredericksburg* published in 1856 and redrawn in 1862 depicts buildings at the approximate location of the survey, but there are no details clearly identify the function of the buildings (Figure 4-115 and Figure 4-116).

Archaeological testing of site 44SP0187 included the excavation of four STPs and metal-detector survey along transects spaced at 6-foot (1.8-m) intervals. Metal detector survey was completed as the site is located within PotNR boundaries for Battle of Fredericksburg I (111-5295), Battle of Fredericksburg II (111-5296), and the Salem Church Battlefield (088-5181). The STP transect crossed the project area from approximately 25 feet (7.6 m) southeast of Sophia Street to the floodplain of the Rappahannock River (Figure 4-117 through Figure 4-119).

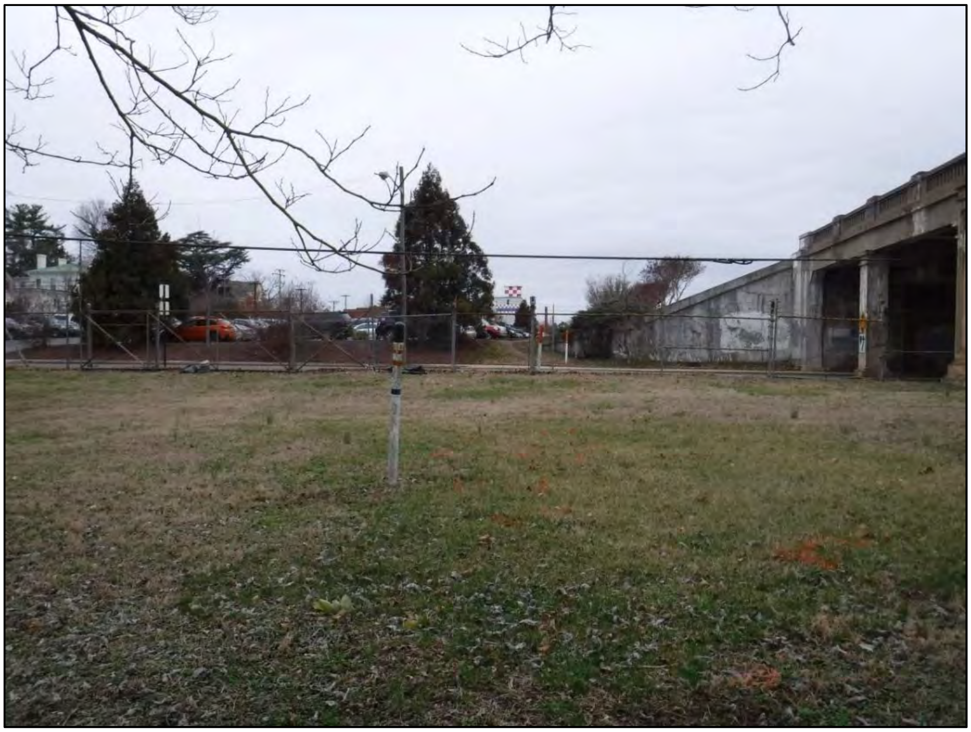

FIGURE 4-117: SOPHIA STREET SHOWING MARKED UTILITY LINE, LOOKING SOUTHWEST

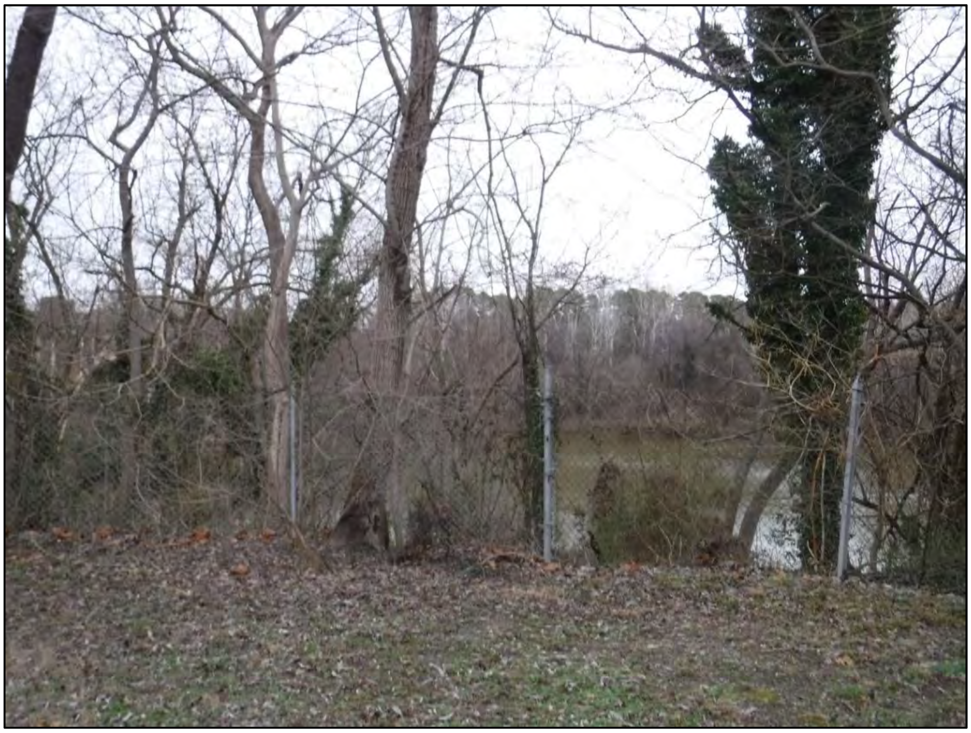

FIGURE 4-118: EDGE OF THE RIDGE AND SLOPE DOWN TO THE RAPPAHANNOCK RIVER, LOOKING SOUTHEAST

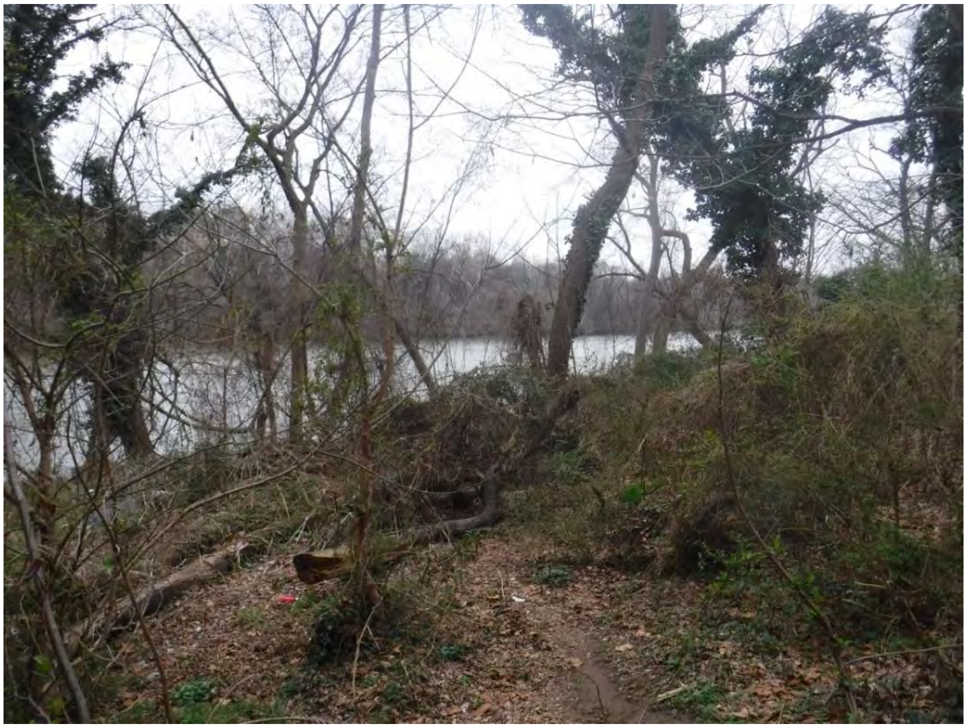

FIGURE 4-119: FLOODPLAIN PORTION OF SITE 44ST0187, LOOKING SOUTHEAST

The average depth of STPs within the site was 1.7 feet (0.5 m), with the deepest STP extending to a depth of 3 feet (0.9 m). The average A-horizon soils measured 0.7 feet (0.2 m). The maximum A-horizon soils measurement within the site measured 1 foot (0.3 m). As a result of considerable disturbance and of the variation in anthropogenic, colluvial, and alluvial deposition across the project area, the profiles of STPs differed considerably. Road gravel in the topsoil and the mix of soils in the underlying stratum indicated disturbance in STP 3b-A-1, while, despite the presence of a relatively large artifact assemblage in STP 3b-A-2, the recovery of an aluminum twist-off bottle cap near the base of Stratum III indicated that all contexts were formed relatively recently (Figure 4-120). Despite apparent disturbance in STP 3b-A-3, located on the small bench above the active floodplain, the complete bricks and large brick bats protruding from the walls and near the base of the 2.2-foot (0.7-m) deep STP indicated the possible presence of an intact, deeply buried stratum.

The domestic assemblage recovered during the STP survey included redware, whiteware, ironstone, stoneware, soft-paste porcelain and various types of bottle and vessel glass. Architectural artifacts included brick fragments, cut and wire nails, and window glass. In addition, a white ball-clay pipe stem, lamp parts, iron straps, and oyster shell were recovered.

A large, rectangular fragment of an iron spring was encountered during metal-detector survey. Other metal items excavated during the metal-detector survey were wire and cut nails, bolts and screws, a faucet part, corroded iron, and aluminum cans, bottle caps, and pop tops. No artifacts clearly dating to the Civil War era or unambiguously associated with a mill were encountered during the archaeological survey.

III = Brown (7.5YR 4/3) sand with very small fragments of shell

FIGURE 4-120: REPRESENTATIVE SOIL PROFILE FROM SITE 44SP0187

4.4.8.2 Evaluation and Significance

Site 44SP0187 is the nineteenth-century Marye's Mill and includes cut stone piers and likely other building remains. Excavations at the site resulted in the recovery of domestic material and evidence of intact subsurface features, but no direct evidence of milling operations. Additional excavations are needed to ascertain the integrity and significance of the deposits, as a buried intact mill-era stratum was noted during the survey. As such, Dovetail **recommends that site 44SP0187 is potentially eligible for the NRHP under Criterion A for its association with the nineteenth-century milling industry in the region and under Criterion D for its archaeological potential.**

4.4.9 Previously Recorded Sites 44SP0687 and 44SP0688

Sites 44SP0867 and 44SP0688, each encompassing a city block in Fredericksburg (blocks 48 and 49 respectively), were identified by the Center for Historic Preservation at the University of Mary Washington in 1992 (see Figure 4-111). Both sites were identified via systematic shovel test survey, followed by test unit excavation and backhoe trenching. According to DHR site files and the report summarizing investigations undertaken at these locations, both sites show evidence of the occupation of these city blocks spanning from the Late Archaic through the twentieth century. Artifacts listed in both site forms include Civil War buttons and Minié-style bullets from the Fredericksburg Union occupation, quartz lithics, animal bone and ceramics from the late-eighteenth- through early-nineteenth-century occupation, and artisan related objects. Pedestrian inspection of these sites during the current investigation indicated that both include paved parking lots and buildings, indicative of their urban location (Figure 4-121 and Figure 4-122). However, previous investigations of these locations have documented the presence of intact cultural deposits beneath modern development (Sanford et al. 1992). As such, it is **recommended that sites 44SP0867 and 44SP0688 are potentially eligible for listing in the NRHP.**

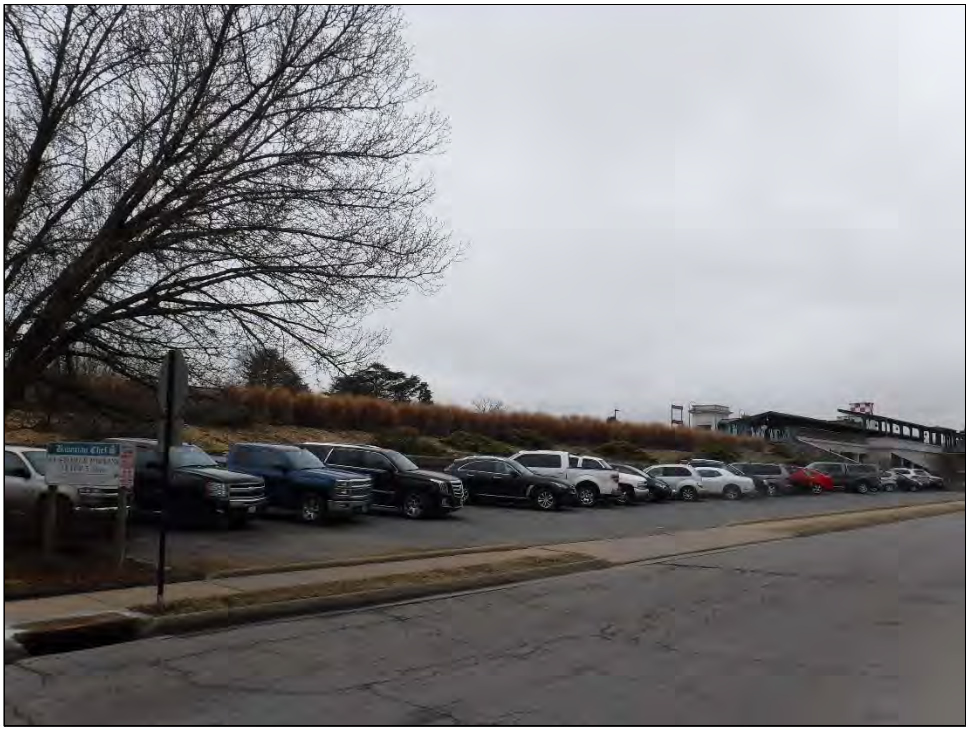

FIGURE 4-121: OVERVIEW OF SITE 44SP0688 WITHIN APE, LOOKING WEST

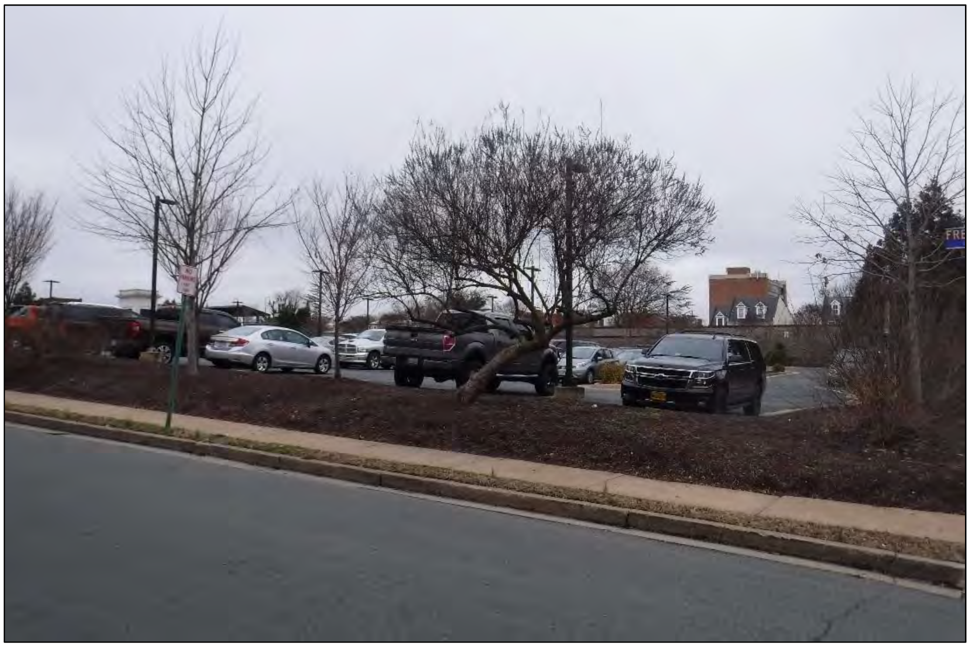

FIGURE 4-122: OVERVIEW OF SITES 44SP0688 AND 44SP0687, LOOKING SOUTHEAST

4.4.10 Previously Recorded Site 44SP0468

Site 44SP0468, Jackson's Earthworks-Encampment site, is a large complex of earthworks and other encampment features associated with the Civil War First Battle of Fredericksburg and lying within the PotNR boundaries of the Fredericksburg I Battlefield (111-5295) (Figure 4-123). The site is mapped mainly to the east of the corridor but encompassing most of Archaeological Area 3d. A section of earthworks, likely associated with this site, was observed during the 2016 survey (McCloskey et al. 2016) but lay slightly outside the APE of that survey. The portion of the current survey area lying within the mapped boundaries of the site lies entirely on the steep and eroded slope running down from Fredericksburg and Spotsylvania National Military Park (111-0147) towards the existing CSXT rail. STP and metal detector survey were undertaken in Archaeological Area 3c, including within site 44SP0468, but recovered no artifacts (Figure 4-124). This resource taken as a whole was recommended in the 2016 report to be potentially eligible for the NRHP under Criterion A for its associated with Civil War activity in the area and under Criterion D for its archaeological potential pending additional studies. DHR concurred with this recommendation in a letter dated October 11, 2016. The current survey did not yield additional artifacts from the site, but the previous recommendation **that the site as a whole remains potentially eligible for the NRHP under Criteria A and D, remains unchanged.**

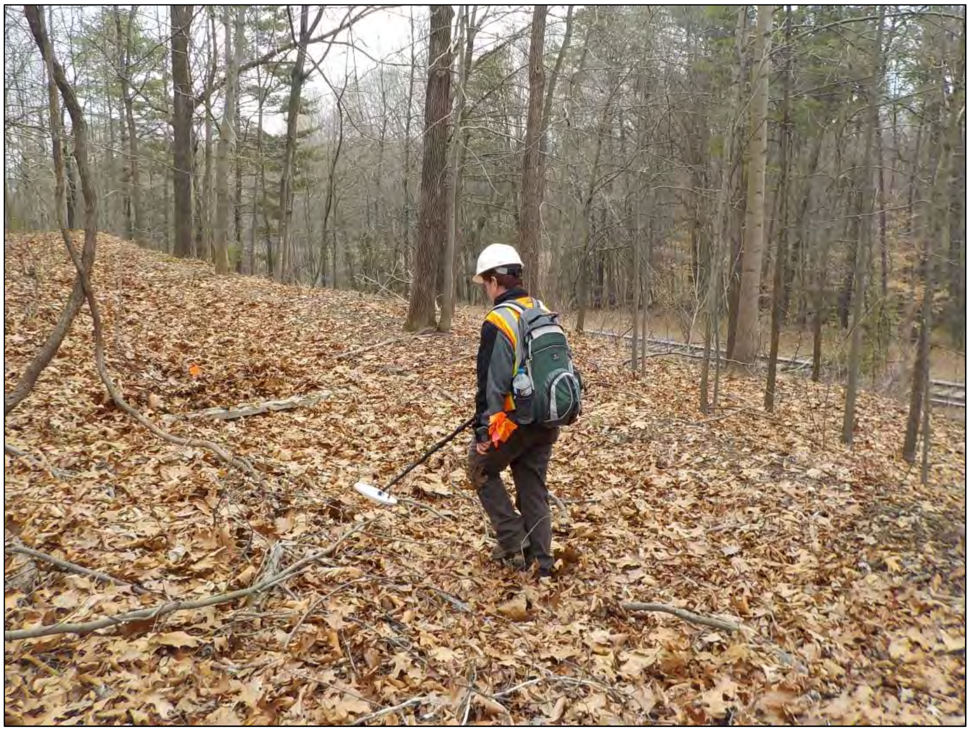

FIGURE 4-124: METAL DETECTOR SURVEY IN SITE 44SP0468, LOOKING NORTHEAST

4.4.11 Newly Identified Site 44SP0767

4.4.11.1 Site Description

Site 44SP0767 is located in a wooded setting (Figure 4-125) on the west side of the CSXT rail line, north of Summit Crossing Road, within the central portion of Archaeological Area 3f (Figure 4-126). This site represents a potential Civil War earthwork measuring 150 by 115 feet (45.7 by 35 m), comprising 0.33 acres (0.1 ha). It sits at an elevation of 210 feet (64 m) AMSL and is approximately 9 feet deep (2.7 m) from the top of earthen mound to the base of the depression.

The site was identified during the pedestrian survey and subsequent STP testing and metal detector survey yielded no cultural material. However, a lack of cultural deposits should not negate the significance of this resource as it was likely hastily constructed in anticipation of a need to defend the nearby railroad during the Civil War. Unfortunately, an exhaustive map search did not reveal any documented earthwork located in this area which could have provided a narrower date range. Despite its absence on historic maps, the Union Army's Fifth Corps were known to be in the general vicinity in 1864. Most notable among the known Civil War presence in the area, General Grant held a war council at the nearby Massaponax Church in 1864, less than 5 miles (8 km) to the west of the site. The earthwork remains observed at site 44SP0767 could be representative of any one of these Civil War activities.

\\DTS2\Main\Job\14-015 RAPS\GIS\2018Work\14_015_RAPS_AE_2018New.mxd | Last Updated: 05.10.2018

An average soil profile for this site contained three stratigraphic levels. Stratum I consisted of a black (10YR 2/1) sand extending to a depth of 0.3 feet (0.09 m) that overlaid a dark yellowish brown (10YR 4/4) sand terminating at 0.6 feet (0.2 m). Beneath the second stratum was a subsoil of a brownish yellow (10YR 6/8) sandy clay (Figure 4-127). Excavation ceased at 0.9 feet (0.3 m) below ground surface.

II = Dark yellowish brown (10YR 4/4) sand
III = Brownish yellow (10YR 6/8) sandy clay

FIGURE 4-127: REPRESENTATIVE STP PROFILE FROM SITE 44SP0767

4.4.11.2 Evaluation and Significance

Site 44SP0767 is a late-nineteenth century Civil War earthwork. Excavations at the site resulted in no cultural material specific to the Civil War occupation of the site and only a large surface feature characterizes this site. While this site is tied to the Civil War, it is unknown if it is related to a significant engagement during the war and, as such, Criterion A is not applicable. Additionally, there are no known associations with significant persons (Criterion B) and the deposits do not illustrate distinctive characteristics of a type, period, or method of construction (Criterion C). Above-ground remains representative of a Civil War earthwork comprise the entirety of the site and with no cultural remains present or identification of the earthwork on historic maps it is unclear at what point during the war this earthwork was constructed. As such, **it is recommended that site 44SP0767 does not have the potential to yield significant data about the nineteenth century occupation of the area (Criterion D).**

4.4.12 Newly Identified Site 44SP0768

4.4.12.1 Site Description

Site 44SP0768/088-5511 is a small twentieth-century family cemetery and associated artifact scatter located in a densely wooded portion of Area 3f. The site is on the west side of the CSXT rail line and north of Summit Crossing Road (see Figure 4-126), situated immediately north and west of a communications tower and associated metal pre-fabricated shed (Figure 4-128). The site was identified during the pedestrian survey and based on the recovery of five fragments of clear bottle glass from one STP. The site measures approximately 250 x 150 feet (76.2 x 45.7 m), but the cemetery area itself measures 25 x 25 feet (7.6 x 7.6 m). The site covers an area of 0.06 acres (0.02 ha) and it sits at an elevation of approximately 230 feet (70.1 m) AMSL.

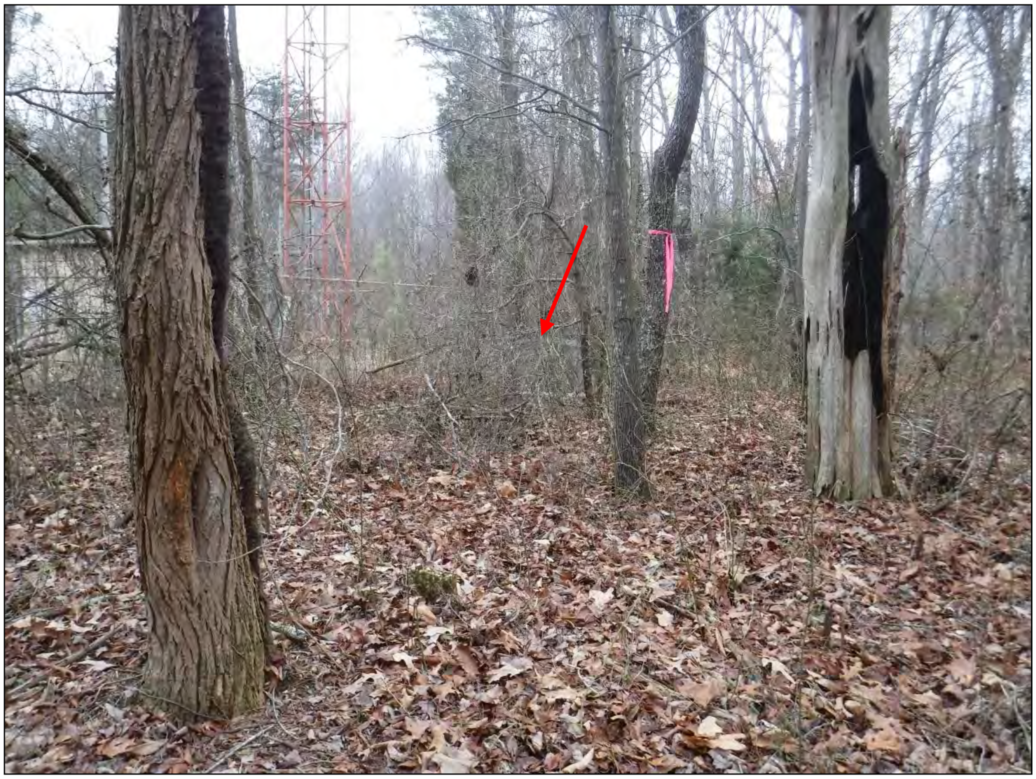

FIGURE 4-128: SITE 44SP0768/088-5511, LOOKING SOUTH. NOTE THE COMMUNICATION TOWER AND SHED TO THE SOUTH AND HEADSTONE (RED ARROW).

The artifact assemblage recovered from site 44SP0768 includes five artifacts, likely indicative of the twentieth century use of the cemetery or adjacent communication tower construction. All five artifacts consist of clear bottle glass. The only STP excavated in the site area was 3f-B-8 East from which the artifacts were recovered, all adjacent STPs were negative for cultural materials. This STP within the site contained two levels. Stratum I, which was 0.2 feet (6 cm) thick, consisted of a dark yellowish brown (10YR 4/2) sand. It overlaid a subsoil consisting of a strong brown (7.5YR 5/6) sandy clay. The STP was terminated at a depth of 0.9 feet (27 cm).

Surface features noted at the site location include two engraved headstones, one footstone, four metal fence posts, and one gate post. One headstone reads "CATLETT/ Vivian 1901–1952/Shirley 1898–1948/Henry 1865–1919/Nellie 1869–1951" and the second reads "Annie Kate/ Gilchrist/ Born/October 11, 1882" (Figure 4-129). The death date on the second stone was not visible at the time of survey as it was buried, but images of the markers located in the findagrave.com database indicate the death date to be 1914 (Findagrave.com 2010). Based on the presence of these stones, it appears that a minimum of five individuals may be buried within the cemetery. Four metal fence posts and a metal gate post were observed surrounding the marked graves, although no fencing in between these posts remains (Figure 4-130).

4.4.11.2 Evaluation and Significance

Site 44SP0768/088-5511 is a small twentieth-century family cemetery and artifact scatter, including five artifacts, the marked interments of five individuals, and the remains of decorative metal fencing. No subsurface excavations were conducted within the cemetery area, as such the cemetery has not been delineated. The cemetery appears to be typical of small family burying grounds encountered throughout the region and does not display any unique architectural elements or known association with people or events important in history. As such, it is **recommended that site 44SP0768/088-5511 is not eligible for NRHP inclusion under Criteria A–D. However, it is recommended that the general cemetery area should be avoided or further delineation efforts should be undertaken to determine the exact limits of the cemetery.**

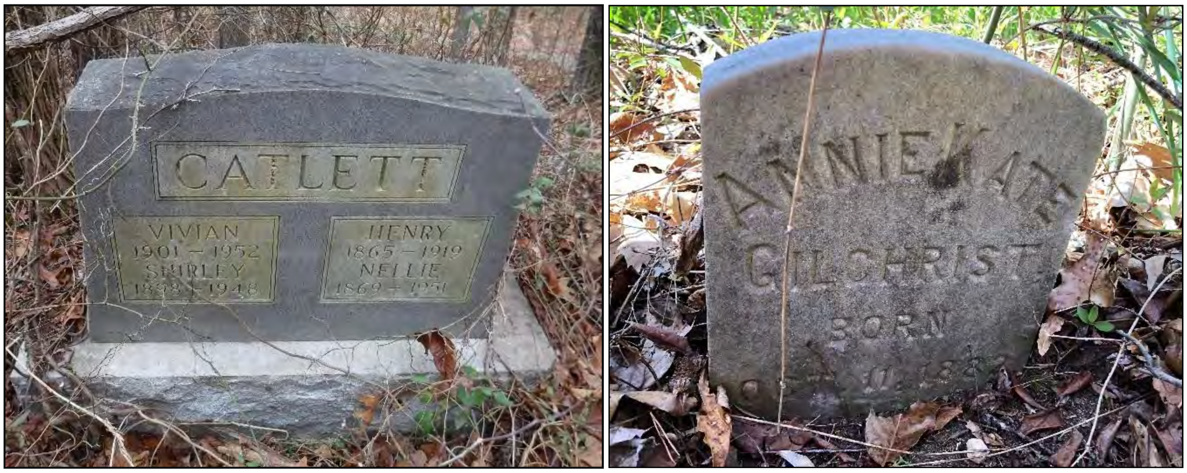

FIGURE 4-129: SITE 44SP0768/088-5511, HEADSTONE DETAILS

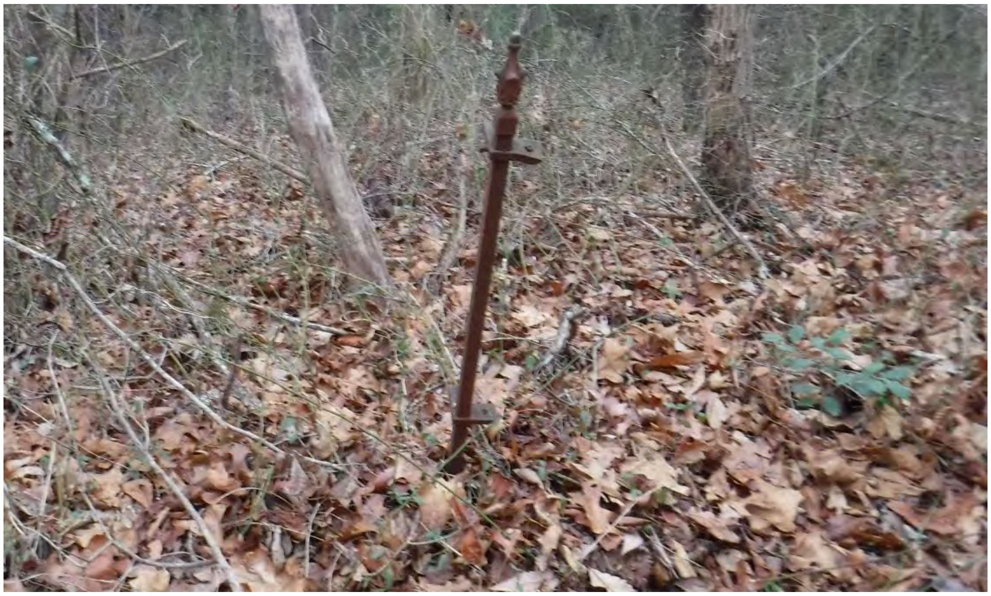

FIGURE 4-130: SITE 44SP0768/088-5511, FENCEPOST DETAIL

4.5 AREA 4: CENTRAL VIRGINIA

The Central Virginia segment (Area 4) of the DC2RVA Preferred Alternative encompasses those portions of the LOD lying within Caroline and Hanover Counties (with the exception of the small portion of Area 3 that extends into Caroline, as discussed above). Beginning in the north at Guinea and ending in the south at the South Anna River, Area 4 runs along approximately 28 miles (45.1 km) of the existing CSXT rail. The areas subjected to study within Area 4 encompasses 3.9 acres (1.2 ha) (see Figure 2-3).

The setting of Area 4 is almost entirely rural, with the development related to Kings Dominion theme park and industrial activity near Doswell being the only substantial development near the project corridor, other than the existing rail. In general, the areas subject to archaeological study within Area 4 are dominated by young evergreen or mixed woods and topography is characterized by either rolling slopes or flatter low lying areas that are often inundated (Figure 4-131). Area 4 consists of five archaeological areas, 4b through 4f, designated for Phase IB archaeological study (note: revisions to the LOD during fieldwork eliminated the need for archaeological survey in Archaeological Area 4a, so it is not discussed or addressed within these results). Two of these archaeological areas, 4c and 4e, were dominated by disturbed, inundated, or sloping areas to such an extent as to entirely preclude shovel testing, though metal detector survey was undertaken in portions of Archaeological Area 4e. The remaining three archaeological areas were subjected to subsurface testing in at least some portions. The North and South Anna Rivers and their tributaries cross the project area in Archaeological Area 4.

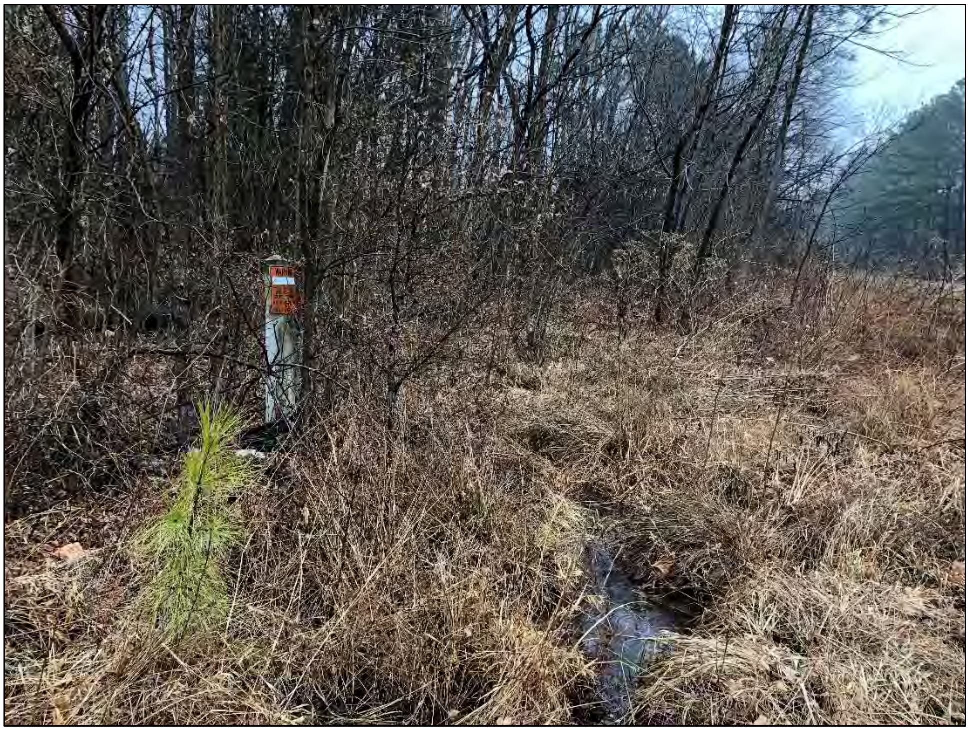

FIGURE 4-131: REPRESENTATIVE VIEW OF AREA 4 SETTING, LOOKING NORTH

A total of 28 shovel tests was excavated in Area 4. Stratigraphy varied greatly across this area, as would be expected from such a small sample over such a large geographic area. No artifacts were recovered from Area 4 nor were any features or archaeological sites identified.

4.5.1 Archaeological Area 4b

Area 4b consists of eight blocks of identified for Phase IB study in Caroline County, four (one at each corner) at the crossing of Woodslane Road near Woodford and the existing rail, and four located similarly at the crossing of Paige Road and the existing rail near Bowling Green. These locations are both at-grade crossings of the rail over those roads, and the grading associated with road construction around these crossings has rendered -inundated areas occupying almost the entire width of the APE. As such, shovel testing in seven of the eight sections could not be completed (Figure 4-132). However, a small strip of woods and plowed field along the north side of Woodslane Road was the subject of subsurface investigation (Figure 4-133). The eight blocks encompass an area of 0.8 acres (0.3 ha). Subsurface testing in Archaeological Area 4b included the excavation of six STPs aligned on a single transect (Figure 4-134 and Figure 4-135). No artifacts were recovered and no sites or features were identified.

The average STP in Archaeological Area 4b reached a depth of 1.3 feet (39.6 cm). The deepest STP extended to a depth of 1.4 feet (42.7 cm). A-horizon soils in Area 4b ranged from 0.8 feet (24.4 cm) to 1.0 feet (30.5 cm) with an average depth of 0.9 feet (27.4 cm). A typical STP profile within Area 4b consisted of a dark yellowish brown (10YR 4/4) sandy loam plow zone overlying a yellowish brown (10YR 5/6) silty clay subsoil (Figure 4-136).

4.5.2 Archaeological Area 4c

Archaeological Area 4c consists of five blocks of area deemed suitable for Phase IB archaeological study spanning approximately 3.5 miles (5.6 km) along an east to west oriented stretch of the existing CSXT rail to the northeast of Ruther Glen in Caroline County. The first block is a long narrow strip paralleling the north side of the rail to the east of Penola Road, while the remaining four blocks are roughly semi-circular and are located at each corner of the crossing of Colemans Mill Road with the existing rail. The eastern section lies entirely in a deeply rutted gravel road lying adjacent to the CSXT rail corridor, while the western section lies in the steep slopes on the sides of Colemans Mill Road as it approaches the crossing with the rail (Figure 4-137 and Figure 4-138). These disturbances precluded STP survey in Archaeological Area 4c (Figure 4-139 through Figure 4-141). No artifacts were recovered, nor were any sites or features identified.

4.5.3 Archaeological Area 4d

Archaeological Area 4d is located in Ruther Glen, in Caroline County. It covers approximately 3,000 feet (914.4 m) along the existing rail line from its northernmost to southernmost studied area. It consists of five discrete blocks located on both sides of the existing rail, to both north and south of the rail's intersection with Dry Bridge Road (Virginia State Route 684). These five blocks include a linear distance of approximately 1,760 feet (536.4), which never exceeded 55 feet (16.8 m) in width and encompassed an area of 0.8 acres (0.3 ha). The area is typified by gently rolling hills, and the study areas generally lie in thin wooded strips between utility corridors or access roads and the existing rail. The slope leading down to the existing rail line often occupies a substantial portion of the area width, and where it does not, disturbance associated with the parallel utility corridors and access roads occupy the bulk of the remainder (Figure 4-142). This leaves only a narrow strip available for subsurface testing, and in several places these disturbances occupied the entire width of the APE, entirely precluding subsurface testing (Figure 4-143). One of the five blocks was, upon pedestrian survey, determined to be entirely disturbed. The remaining four blocks received subsurface investigation. STP survey consisted of a total of 16 STPs placed along four transects, one transect in each of the four blocks (Figure 4-144 through Figure 4-146). Even where STPs were excavated, the profiles often indicated disturbed soils (Figure 4-147). No artifacts were recovered, nor were any sites or features identified in Archaeological Area 4d.

04/2018

STP profiles vary substantially across Archaeological Area 4d, and as discussed above, a number of STPs contained clearly disturbed soils. STPs were excavated to an average depth of 1.2 feet (36.6 cm) with the deepest reaching 1.9 feet (57.9 cm). A horizon soils ranged from 0.2 feet (6.1 cm) to 1.0 feet (30.5 cm), averaging 0.4 feet (12.2 cm). A typical non-disturbed STP profile within Area 4d consisted of dark grayish brown (2.5Y 4/2) sandy loam topsoil, under which was brownish yellow (10YR 6/6) sandy clay subsoil (Figure 4-148).

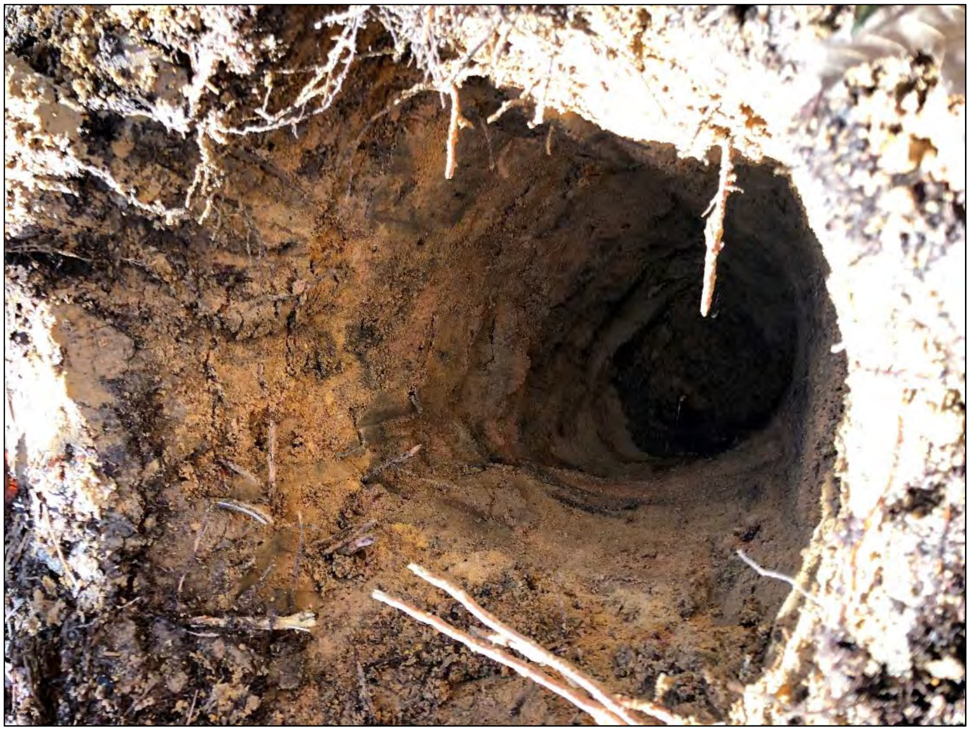

FIGURE 4-147: DISTURBED SOILS IN AREA 4D STP

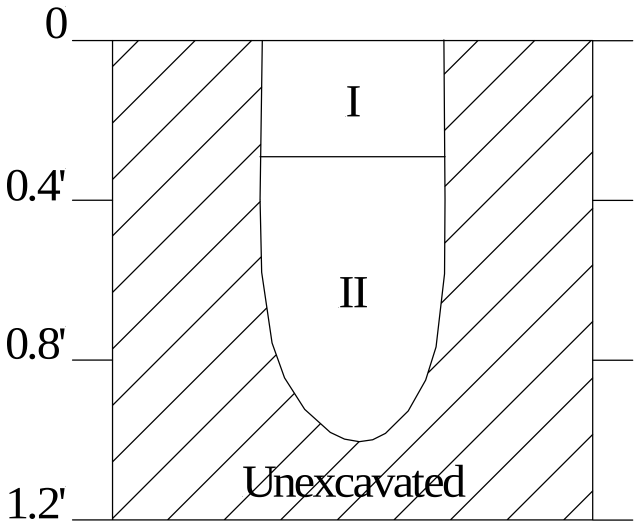

Munsell:

I = Dark grayish brown (2.5Y 4/2) sandy loam

II = Brownish yellow (10YR 6/6) sandy clay

FIGURE 4-148: REPRESENTATIVE SOIL PROFILE FROM AREA 4D, STP 4D-E-1

4.5.4 Archaeological Area 4e

Archaeological Area 4e consists of two study blocks on the west side of the existing rail line, immediately south of the North Anna River. The two areas span a total length of 865 feet (263.7 m), which had a maximum width of 35 feet (10.7 m). These areas identified for Phase IB study encompass an area of 0.5 acres (0.2 ha). The area was generally unsuitable for subsurface testing based on the presence of an access road within the APE. Additionally, poorly drained soils within the APE had left much of the area inundated at the time of survey (Figure 4-149). Push piles were also observed throughout the areas identified for Phase IB study. Although a STP survey was not performed as a result of these clear signs of disturbance, a metal detection survey was conducted, as Archaeological Area 4e lies entirely within the study area for the North Anna Battlefield (042-0123). The only items recovered from metal detection were modern refuse, such as beer cans, galvanized wire, and aluminum foil, that was discarded in the field. No artifacts were found and no sites or features were identified in Archaeological Area 4e (Figure 4-150).

4.5.5 Archaeological Area 4f

Archaeological Area 4f is a north-south oriented area consisting of three discrete blocks, all located on the west side of the existing rail line. Located in Doswell less than 0.5 miles (0.8 km) west of Kings Dominion theme park, Archaeological Area 4f spans a total distance of 1.5 miles (2.4 km) and measures less than 40 feet (12.2 m) wide. The locations identified for Phase IB study encompass an area of 1 acre (0.4 ha). Most of this area was found to be disturbed as a result of the pedestrian survey, as most of the APE falls either in the slope leading to the existing rail, or in a buried fiber optic corridor (Figure 4-151). One section, however, contained enough level ground outside of the rail grade to permit a single transect of nine STPs (Figure 4-152). No artifacts were found and no sites or features were identified in Archaeological Area 4f (Figure 4-153 and Figure 4-154).

Although STP survey was undertaken in one portion of Archaeological Area 4f that was not obviously disturbed based on pedestrian reconnaissance, subsurface testing indicated that even that area was disturbed, likely by a nearby buried fiber optic utility corridor. All nine excavated STPs showed similar evidence of disturbance, with mixed soils to depths of 1.5 feet (45.7 cm). A typical STP profile consisted entirely of various clumps and bands of brownish yellow (10YR 6/8), dark grayish brown (2.5Y 4/2), and brownish yellow (10YR 6/6) sandy loam and sandy clay with 40 percent gravel (Figure 4-155 and Figure 4-156).

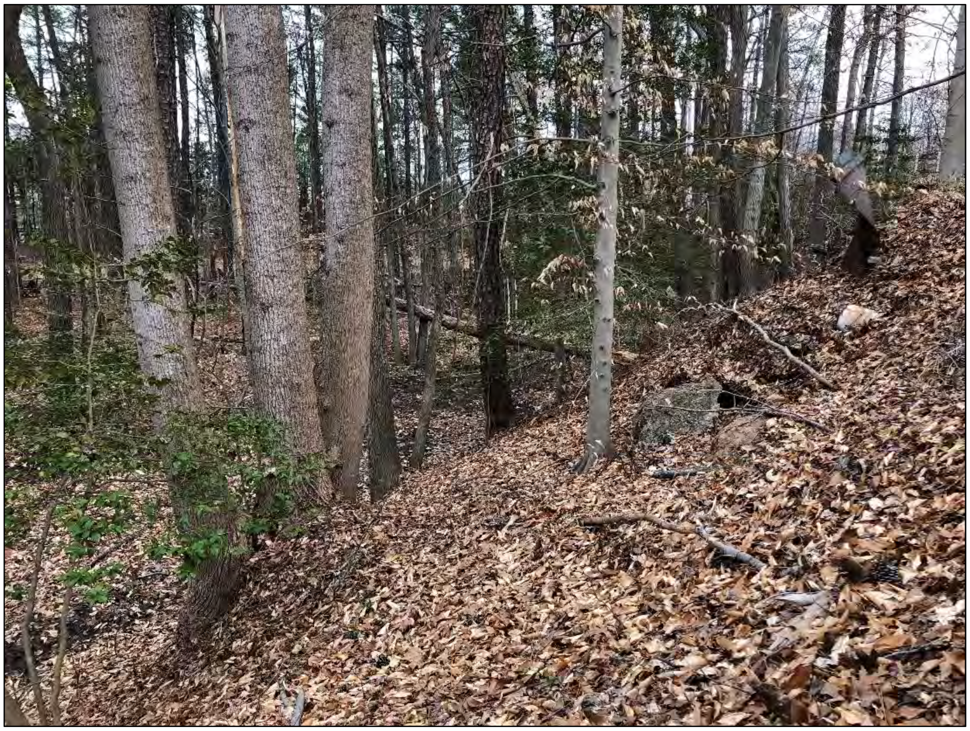
FIGURE 4-156: REPRESENTATIVE SOIL PROFILE FROM AREA 4F, STP 4F-A-5

4.6 AREA 5: ASHLAND

The Ashland Area (Area 5) of the DC2RVA Preferred Alternative encompasses those portions of the LOD to the north and south of downtown Ashland, located in Hanover County. Beginning in the north near the South Anna River and ending on the south near Center Street Road, Area 5 extends along approximately 3 miles (4.8 km) of the existing CSXT rail. It also extends along U.S. Highway 1 (Route 1) to the northwest of that road's crossing with the existing rail for approximately 0.5 miles (0.8 km). The archaeological area identified for Phase IB study with Area 5 encompass 31.7 acres (12.8 ha) (see Figure 2-4).

The setting of Area 5 is a mixture of rural and suburban, including both wooded areas, domestic lots, and industrial locations. In general, the Phase IB study areas lie along the edges of either the existing rail or those roads which cross the rail as it approaches Ashland. These areas were generally steeply sloped, particularly in those areas that approach either Route 1 or the substantial railroad bridge over the South Anna River (Figure 4-157). Area 5 consists of three archaeological areas, Areas 5a through 5c, designated for Phase IB study. Although pedestrian survey revealed that the majority of Area 5 was disturbed, at least some portion of each of the three areas was sufficiently intact to allow some subsurface testing.



5

FIGURE 4-157: REPRESENTATIVE VIEW OF AREA 5 SETTING, LOOKING NORTH

A total of 84 shovel tests was excavated in Area 5. Stratigraphy varied greatly across this area, as would be expected from such a small sample over such a large geographic area. Two artifacts were recovered from Area 5, resulting in the identification of a single isolated find, ISF 5a-1. No features or archaeological sites were identified.

4.6.1 Archaeological Area 5a

Archaeological Area 5a consists of several survey blocks, located along the existing rail, as well as along Cross Corner and Ellets Crossing Roads and Route 1. Archaeological Area 5a begins at the South Anna River and continues south across approximately 1.8 miles (2.9 km) of the existing rail corridor, as well as extending out along the aforementioned roads, to encompass a total of 13 acres (5.3 ha) subjected to Phase IB survey. The APE within Archaeological Area 5a is largely occupied by mixed secondary growth forest, with dense brambles and numerous fallen trees, but the immediate surroundings outside the corridor are relatively developed including industrial and municipal facilities. The pedestrian survey of Archaeological Area 5a revealed wide-spread surface and subsurface disturbance, which precluded subsurface testing in most locations. The substantial construction grading necessary to build roads and railroads through the rolling topography within Archaeological Area 5a resulted in most portions lying in the steep artificial slopes leading up from or down to the nearby roads and railroads (Figure 4-158). However, some portions of Area 5a were located on level ground that was not obviously disturbed (Figure 4-159). Subsurface testing in Archaeological Area 5a included 14 STPs located on three transects (Figure 4-160 through Figure 4-164). STPs produced two artifacts, resulting in the identification of a single isolated find. ISF 5a-1 consisted of two pieces of prehistoric quartz debitage produced from one primary STP and one radial STP. ISFs are, by definition, not eligible for NRHP listing.

The average STP in Archaeological Area 5a reached a depth of 1.0 feet (30.5 cm), with the deepest STP excavated to 1.5 feet (45.7 cm). A-horizon soils in Area 5a had an average thickness of 0.5 feet (15.2 cm) and ranged from 0.1 feet (3.0 cm) to 0.8 feet (24.4 cm) thick. A typical STP profile for Archaeological Area 5a consisted of light olive brown (2.5Y 5/3) clay loam topsoil, overlying light yellowish brown (2.5Y 6/4) silty clay (Figure 4-165)

FIGURE 4-165: REPRESENTATIVE SOIL PROFILE FROM AREA 5A, STP 5A-A-2

4.6.2 Archaeological Area 5b

Archaeological Area 5b consists of study blocks lying along the existing rail and along Archie Cannon Drive/Vaughan Road in the vicinity of the rail. These blocks span across approximately 1.3 miles (2.1 km) north to south along the existing CSXT rail line and 0.5 miles (0.8 km) east to west along Archie Cannon Drive/Vaughan Road. The portion of Area 5b identified for Phase IB study encompasses an area of 11.2 acres (4.5 ha). The setting transitions from the more industrially oriented outskirts of Ashland to the essentially suburban setting along Archie Cannon Drive. As with much of Area 5, these blocks lie largely in the already graded areas along these transportation corridors and are disturbed (Figure 4-166). Several areas extending off Archie Cannon Drive/Vaughan Road, however, appeared relatively undisturbed and were subjected to STP survey (Figure 4-167). The portions of Archaeological Area 5b identified for Phase IB survey were tested with 29 STPs aligned on six transects (Figure 4-168 through Figure 4-174). No artifacts were recovered from testing in Area 5b, nor were any sites or features identified.

Average depth of STPs in Archaeological Area 5b was 1.0 feet (30.5 cm) with a maximum depth of 1.7 feet (51.8 cm), while A horizons, which ranged from 0.2 feet (6 cm) to 1.3 feet, averaged a depth of 0.6 feet (18.3 cm). A typical STP profile in Area 5b consisted of olive brown (2.5Y 4/3) sandy loam topsoil which capped light yellowish brown (10YR 6/4) sandy clay subsoil (Figure 4-175).

4.6.3 Archaeological Area 5c

Archaeological Area 5c lies along both sides of Ashcake Road, south of downtown Ashland, at Ashcake's crossing of the existing CSXT railroad. It covers approximately 0.5 miles (0.8 km), with one notable larger block running diagonally from Ashcake over approximately 900 feet (274.3 m) toward the existing rail. Two additional blocks of survey on Elmont Road were also included in Archaeological Area 5c, resulting in a total study area of 7.5 acres (3 ha). Located at the south end of Ashland, Archaeological Area 5c is a mixture of suburban and rural settings. The portions of Archaeological Area 5c lying immediately adjacent to Ashcake Road were almost entirely disturbed by road construction grading and development, though small undisturbed areas were found in some areas and tested with STPs (Figure 4-176). The bulk of this subsurface testing took place in the pasture lying within the southwest corner of Ashcake's crossing with the CSXT rail (Figure 4-177). Archaeological Area 5c was tested with a total of 41 STPs along 8 transects (Figure 4-178 through Figure 4-180). All STPs were negative, and no artifacts were recovered from Archaeological Area 5c. No archaeological features or sites were identified.

STPs in Archaeological Area 5c reached an average depth of 1.2 feet (36.6 cm) and a maximum depth of 1.6 feet (48.8 cm). A-horizon soils in Area 5c averaged 0.8 feet (24.4 cm) and ranged from 0.3 to 1.2 feet (9.1 to 36.6 cm) in depth. A typical soil profile recorded in Area 5c consisted of dark olive brown (2.5Y 3/3) sandy loam topsoil overlying brownish yellow (10YR 6/6) sandy clay sterile subsoil (Figure 4-181).

4.7 AREA 6: RICHMOND

The Richmond Area (Area 6) of the DC2RVA Preferred Alternative LOD is located in Henrico and Chesterfield Counties and the City of Richmond. Starting in the north, the first portion of the Phase IB study is located just south of Interstate Highway 295 (I-295). From there Area 6 continues south through Glen Allen and towards the City of Richmond, passing through downtown Richmond and crossing the James River into the Manchester Area, continuing into Chesterfield County and ending at the crossing of Centralia Road and the existing CSXT railroad in Centralia (see Figure 2-5). Area 6 spans across approximately 14 miles (22.5 km) of the existing railroad corridor and areas within it identified for Phase IB study encompasses 32.8 acres (13.3 ha). Area 6 consists of eight archaeological areas, 6a through 6h.

The setting of Area 6 varies substantially from the commuter community settings found in Glen Allen and Centralia at either end of Area 6, through the dense commercial development in Henrico just north of Richmond, the downtown commercial setting, and heavily industrialized areas immediately south of the James River (Figure 4-182). Like much of the project corridor, substantial portions of Area 6 were found to be unsuitable for subsurface testing based on the pedestrian reconnaissance. This reconnaissance revealed a variety of existing disturbances within the APE, mainly consisting of the construction grading and artificially sloped embankments associated with the CSXT corridor.

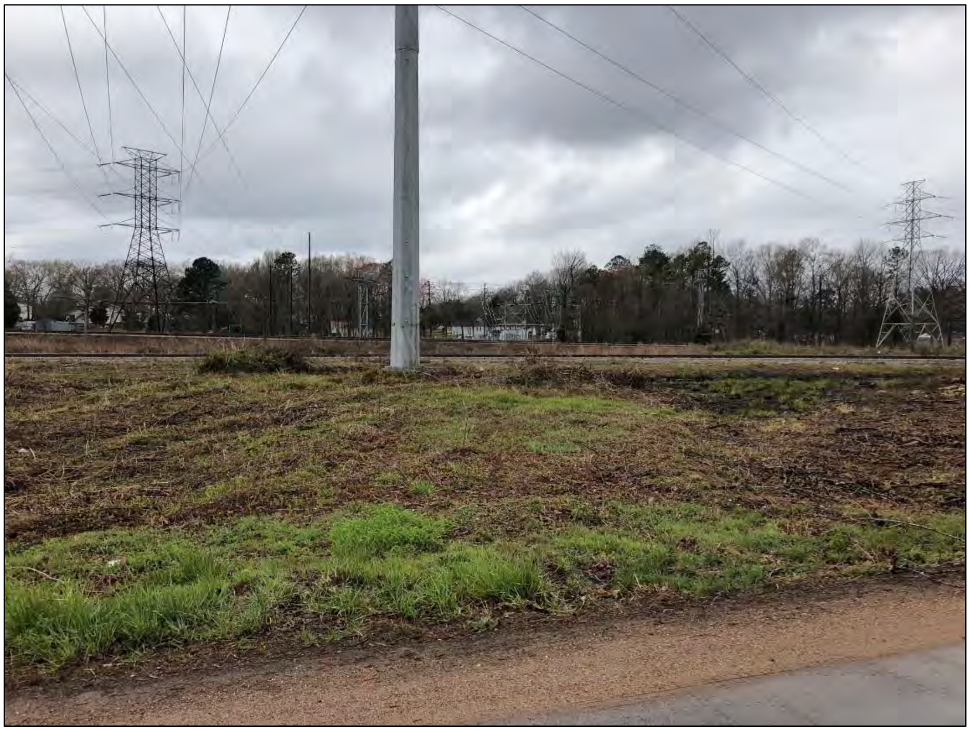

FIGURE 4-182: TYPICAL SETTING IN AREA 6, LOOKING WEST

Subsurface testing in Area 6 consisted of STP survey, as well as metal detector survey within the small areas of the Yellow Tavern Battlefield (043-5108) and Proctor's Creek Battlefield (020-5320) that overlap the APE. A total of 44 STPs was excavated in Area 6, producing 22 artifacts and resulting in the identification of a single new site, 44HE1202. Additionally, two sites were identified by historic map research (44HE1203 and 44HE1204), while eight previously identified sites (44CF0022, 44CF0123, 44CF0260, 44CF0680, 44HE0357, 44HE1094, 44HE1097, and 44HE1098) that overlap the project area were inspected.

4.7.1 Archaeological Area 6a

Archaeological Area 6a, located in Henrico County, has its northern end just south of I-295. From there it follows the existing CSXT rail approximately 2 miles (3.2 km) to the south across Mountain and Hungary Roads, before ending just south of Hungary Road. It includes small portions extending to the east and west along Hungary Road and Mountain Road. The total area encompassed by survey in Area 6a was 6.1 acres (2.5 ha). Near Hungary Road, the study area overlaps the Yellow Tavern Battlefield (043-5108). Construction grading associated with the railroad and the nearby roads, as well as buried utilities and inundation, precluded subsurface testing throughout much of Archaeological Area 6a (Figure 4-183 and Figure 4-184). However, where the railroad and surrounding land were all relatively level near the crossing of Hungary Road, STP survey was performed (Figure 4-185). Metal detection was attempted in the areas within the Yellow Tavern Battlefield (043-5108), but the graded, graveled setting and prevalence of trash limited the efficacy of that technique. STP survey included the excavation of 31 STPs on nine transects (Figure 4-186 through Figure 4-189). A total of 22 artifacts was recovered from Area 6a, resulting in the identification of a single historic site, 44HE1202, discussed below after the area descriptions.

4.7.2 Archaeological Area 6b

Archaeological Area 6b consists of only two small sections, one in the Amtrak parking lot at Bremner Boulevard and Staples Mill Road and the other along Hermitage Road near its intersection with Edenbrook Drive. These sections encompass 2.1 acres (0.8 ha). These areas are entirely disturbed, with the area at the Amtrak station having been recently paved and graded, while the areas along Hermitage Road lie entirely in steep slopes and drainages along the edge of that road (Figure 4-191). No STP survey was possible in Archaeological Area 6b, and no sites, features, or artifacts were identified (Figure 4-192 and Figure 4-193).

4.7.3 Archaeological Area 6c

Archaeological Area 6c is another small area in Henrico County consisting of a number of blocks in one location along the overpass of Dumbarton Road over the existing CSXT rail and another pair of survey blocks along the CSXT rail south of Dumbarton Road. The areas identified for Phase IB study within Archaeological Area 6c encompass 9.6 acres (3.9 ha). This portion of the APE reflects the most heavily developed parts of the Richmond metro area, with disturbance related to the railroad, Interstate Highway 64 (I-64), the local road grid, and residential development all making the entirety of Archaeological Area 6c unsuitable for subsurface testing. The sections along Dumbarton Road lie mainly in the sloped margins of the overpass or in graveled front drives with buried utilities, while the sections along the CSXT rail lie in a highly deflated and graveled work area (Figure 4-194 and Figure 4-195). Given this widespread disturbance, no subsurface testing was undertaken in Archaeological Area 6c (Figure 4-196 and Figure 4-197).

4.7.4 Archaeological Area 6d

Archaeological Area 6d consists of a single study block located on the western side of the existing rail line, near the intersection of Hermitage Road and Leigh Street in the City of Richmond. The area begins approximately 400 feet (121.9 m) northwest of Hermitage Road, and its longest side parallels the existing rail for 650 feet (198.1 m) from there. Overall the area, which has a maximum width of approximately 185 feet (56.4 m), has a roughly triangular shape and occupies 1.4 acres (0.6 ha) in a heavily graded, graveled, and otherwise disturbed wedge of land between an electric power substation and the CSXT railroad (Figure 4-198). Subsurface testing in Archaeological Area 6d was entirely precluded by disturbance. No artifacts were found and no sites or features were identified in Archaeological Area 6d (Figure 4-199).

4.7.5 Archaeological Area 6e

Archaeological Area 6e consists of two locations identified for Phase IB archaeological study: one along St. James Street, just north of downtown Richmond, and the second running adjacent to sections of CSXT rail between Oliver Hill Way and I-95, occupying a combined area of 7.1 acres (2.9 ha). The portion lying on the west side of St. James Street runs along that road for approximately 400 feet (121.9 m) and lies entirely in the extremely steep slope up from that road, or in the ditch between the slope and the road (Figure 4-200). The larger area, along the CSXT rail, is approximately 2,200 feet (670.6 m) long and is also entirely disturbed, dominated by gravel, rubble, and push piles (Figure 4-201). Subsurface testing in Archaeological Area 6e was entirely precluded by disturbance. No artifacts were found, and no new sites or features were identified during the survey; however, historic map analysis resulted in the identification of two new archaeological sites, 44HE1203 and 44HE1204 (Figure 4-202 through Figure 4-204), both described below.

4.7.6 Archaeological Area 6f

Archaeological Area 6f is composed of several separate blocks identified for Phase IB archaeological study generally organized into three locations. The first of these locations is between Commerce Road and the existing CSXT rail as they parallel I-95 near Ancarrow's Landing in Richmond and the remaining two are situated along Ruffin Road and Dale Avenue. These sections encompass a total area of 3.4 acres (1.4 ha) identified for Phase IB archaeological study. The sections along Commerce and Ruffin Road were subjected to pedestrian survey only, as extensive grading activity in the industrial area along Commerce Road, buried utilities in the residential area on Ruffin Road, and paved surfaces throughout precluded subsurface investigations (Figure 4-205). However, in the wooded area to the south of Dale Avenue, no obvious disturbance was observed and as such, a single transect of two STPs was excavated (Figure 4-206). No artifacts were found and no sites were identified in Archaeological Area 6f (Figure 4-207 through Figure 4-210).

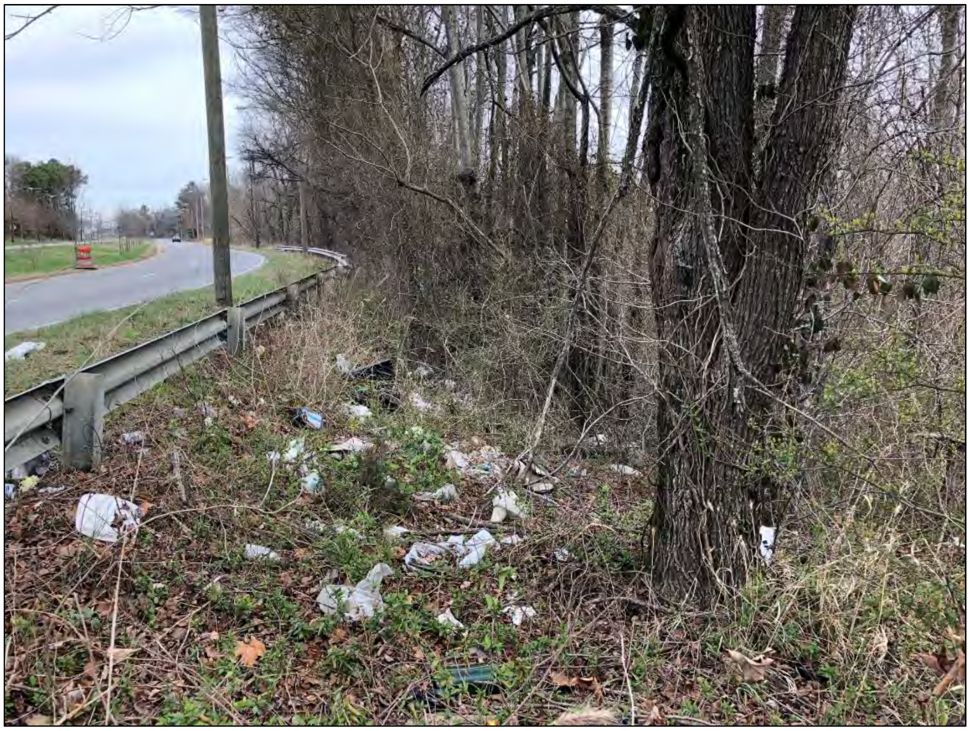

FIGURE 4-205: ROAD CONSTRUCTION AND SLOPE DISTURBANCE IN AREA 6F ALONG COMMERCE ROAD, LOOKING NORTHEAST

The two STPs excavated in Archaeological Area 6f had relatively similar soils, consisting of thin topsoil overlying clayey subsoil. The average STP reached a depth of 0.8 feet (24.4 cm), with the deeper STP reaching 1.0 feet (30.5 cm), while the A horizons averaged 0.3 feet (9.1 cm). A representative profile consists of brown (10YR 4/3) sandy loam overlying light brownish (10YR 6/2) gray sandy clay (Figure 4-211).

4.7.7 Archaeological Area 6g

Archaeological Area 6g is located in Chesterfield County and consists of two large locations. The larger, northern block is clustered around Elliham Avenue at its overpass of the existing rail. The smaller, southern block is located near the intersection of Kingsland and Chester Roads. These combine for a total of 2.3 acres (0.9 ha). The southern portion of Archaeological Area 6g was not subjected to subsurface testing due to notable surface disturbances. It is situated in an area extensively graded and around Kingsland Road's crossing of the existing rail line and in inundated areas as the grading along the rail approaches a creek. The much larger northern portion also contains substantial disturbance, as the overpass required substantial grading, and the area in general slopes down from I-95 on the east toward the much lower lying rail line. Along Elliham Avenue, driveways and the drainage and utilities along the road precluded subsurface testing (Figure 4-212). However, two sections, one in a flat field adjacent to the overpass and one paralleling the rail on the east, were subjected to subsurface testing (Figure 4-213).

Subsurface testing in Archaeological Area 6g consisted of 10 STPs located on three transects. A very narrow portion of the Proctors Creek Battlefield (020-5320) overlaps the project area south of Elliham Avenue, but the steep, and apparently artificial slope in this area made STP and metal detector survey impracticable (Figure 4-214). No artifacts were recovered, nor were any new sites or features identified (Figure 4-215 through Figure 4-217). Previously identified site 44CF0022 also intersected the APE in this location; the site is discussed in detail below.

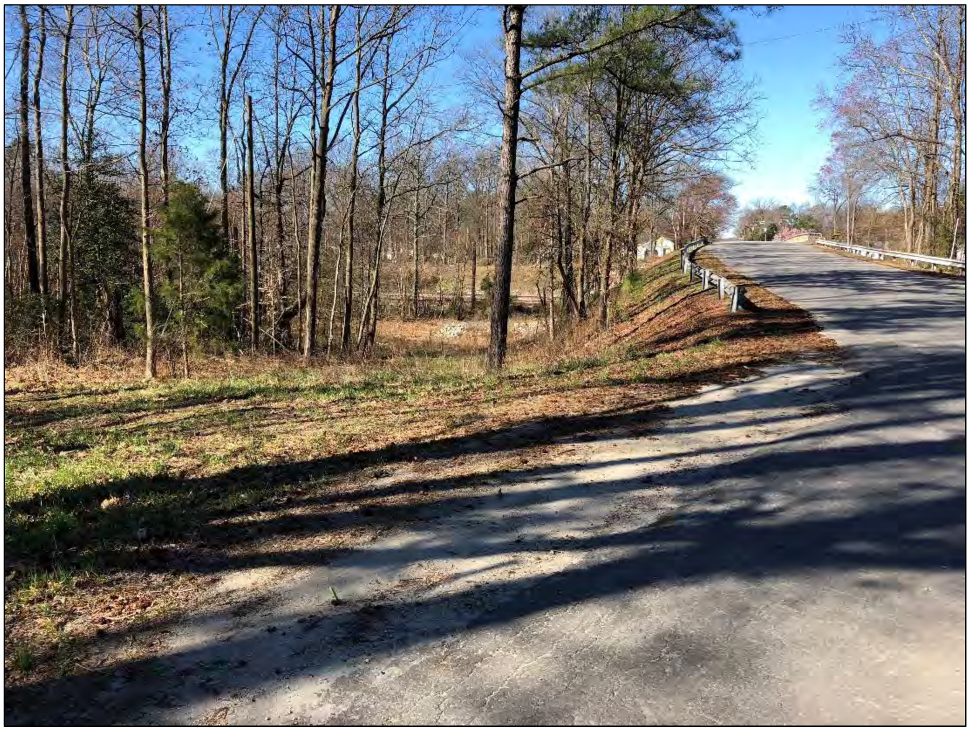

FIGURE 4-212: GRADING OF OVERPASS IN AREA 6G ON ELLIHAM AVENUE, LOOKING WEST

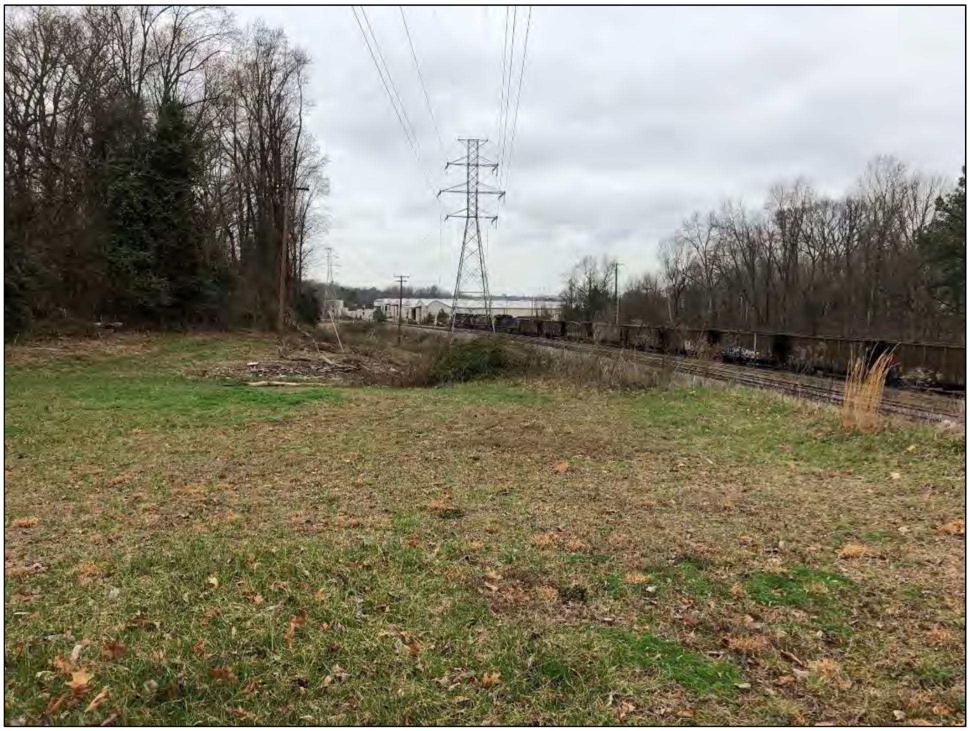

FIGURE 4-213: PORTION OF AREA 6G, NORTH OF ELLIHAM AVENUE, SUBJECTED TO SUBSURFACE TESTING, LOOKING NORTH

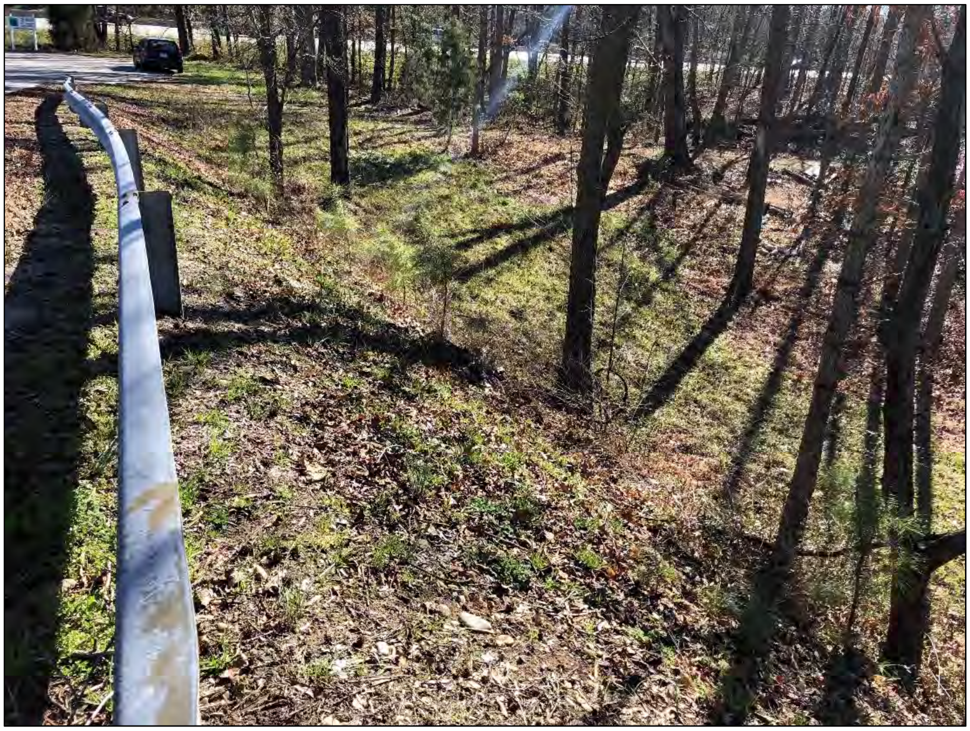

FIGURE 4-214: GRADING FROM OVERPASS, WITHIN PROCTORS CREEK BATTLEFIELD, LOOKING EAST

STPS in Archaeological Area 6g reached an average depth of 0.8 feet (9.1 cm) with a maximum depth of 1.4 feet (42.7 cm). A-horizon soils in Area 6g STPs had an average thickness of 0.4 feet (4.6 cm) and ranged from 0.1 to 1.0 feet (3.0 to 30.5 cm). A typical STP profile in Area 6g consisted of dark yellowish brown (10YR 3/4) silt loam topsoil overlying brownish yellow (10YR 6/6) silty clay subsoil (Figure 4-218).

4.7.8 Archaeological Area 6h

Archaeological Area 6h is the southernmost area within the APE. It is located in Chesterfield County and consists of three locations identified for Phase IB study lying on the east side of the existing CSXT rail between Chester Road and Virginia State Route 288, as well as two smaller locations further to the south, lying on either side of Old Lane on the west side of its crossing of the existing rail. Combined, these locations within Archaeological Area 6h include 0.7 acres (0.3 ha). The three northern portions all lie in disturbed areas along the existing CSXT rail (Figure 4-219). Three portions of this area are traversed by the mapped extent of previously recorded site 44CF0680, Fort Darling, but no evidence of visible earthworks could be seen within or in the viewshed of the project corridor (Figure 4-220). Site 44CF0680 was evaluated as part of the previous DC2RVA Phase IB survey (McCloskey et al. 2016) but is discussed further below.

The southern portion along Old Lane is also largely disturbed, either in graded or graveled areas along the road, but a small part of this location appeared undisturbed and was tested with a single STP (Figure 4-221 through Figure 4-223). This STP had a profile consisting of an A horizon of brown (10YR 4/3) sandy loam reaching a depth of 0.7 feet (21.3 cm) overlaying a sterile subsoil of light yellowish brown (10YR 6/4) clay sand that was excavated to a depth of 1.1 feet (33.5 cm) (Figure 4-224). This portion of Archaeological Area 6h is within Proctors Creek Battlefield (020-5320), as such metal detector survey was completed. No artifacts were found and no new sites were identified in Archaeological Area 6h.

4.7.9 Previously Recorded Site 44HE0357

Site 44HE0357, located east of Main Street Station in Richmond, is currently recorded as a privy/pit complex dating to the eighteenth and nineteenth century (Figure 4-225). No bibliographic reference or other documentation is provided in DHR's site files, other than to note that the site was recorded by then Virginia Department of Transportation (VDOT) archaeologist Lyle Browning. The site form further describes the site as:

> …bounded by the backs of several decrepit buildings on the west and a parking lot under tarmacadam on the east. To the north and south are derelict areas. The three holes presently open show a black heavily organic nightsoil buildup containing oyster shell, late 18th-mid 19th century ceramics, tile drain, metal drain frags., and gingerbeer bottles. Local tradition has it that the honeywagons were dumped in the vicinity in a small either alley or stream like area. This site is being at present severely pothunted by privy hunters for glass and ceramics. [Browning 1980]

The site is currently located underneath a paved parking lot to the east of Main Street Station (Figure 4-226). Based on its location within a paved parking lot, no Phase IB subsurface investigations were undertaken at the site during the current survey; as such the subsurface integrity of the site is unknown. However, pedestrian survey of the area did document near-surface disturbances indicative of the urban location of the site. Excavations in the immediate vicinity of this site have demonstrated that cultural deposits have the potential to be preserved, buried under modern and historic fill (Laird 2006, 2010). Based on the potential for buried cultural deposits within this site location and the inability for the Phase IB methodology of this investigation to adequately assess the integrity of any potential deposits, **it is recommended that site 44HE0357 is potentially eligible for listing in the NRHP under Criterion D.**

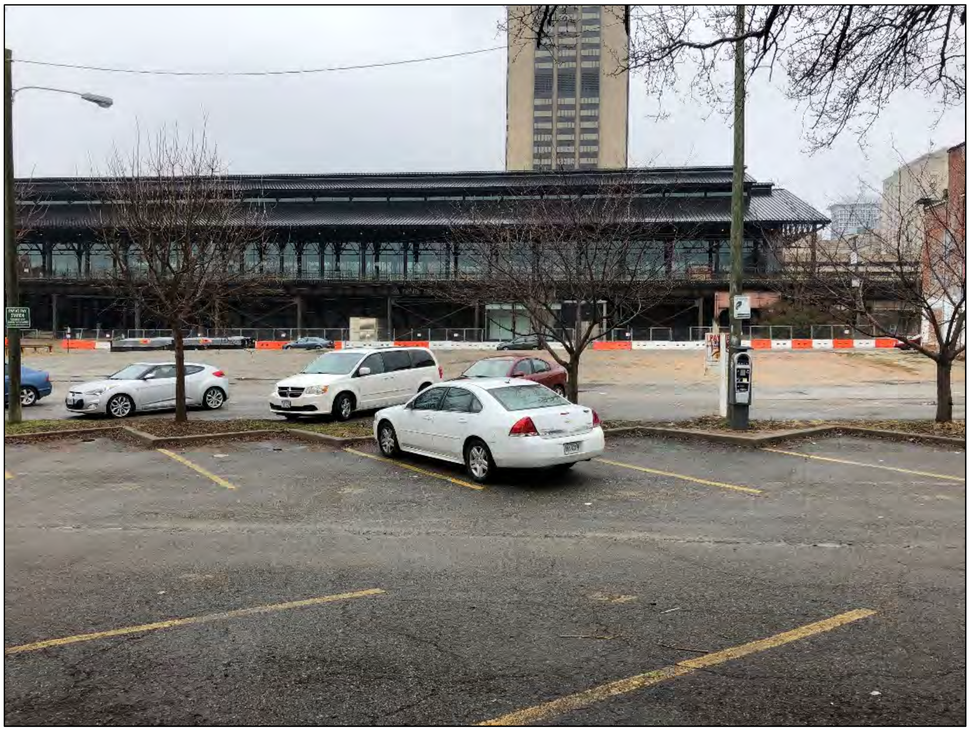

FIGURE 4-226: OVERVIEW OF SITE 44HE0357, LOOKING WEST

4.7.10 Previously Recorded Sites 44HE1094, 44HE1097 and 44SHE1098

Site 44HE1094 is recorded in DHR site files as a nineteenth-century Commissary Warehouse and located in Archaeological Area 6e northwest of the intersection of Interstate Highway 195 (I-195) and I-95. The site is currently not evaluated for listing in the NRHP (see Figure 4-225). The site was identified during archaeological work in advance of the Richmond Floodwall project in the early 1990s. Unfortunately, an archaeological report was never completed in association with this Richmond Floodwall project, so little is known about the identification or composition of the site. During the current survey, a pedestrian inspection of the site area found it to be located within a paved parking lot and extant buildings along 15th Street in Richmond (Figure 4-227).

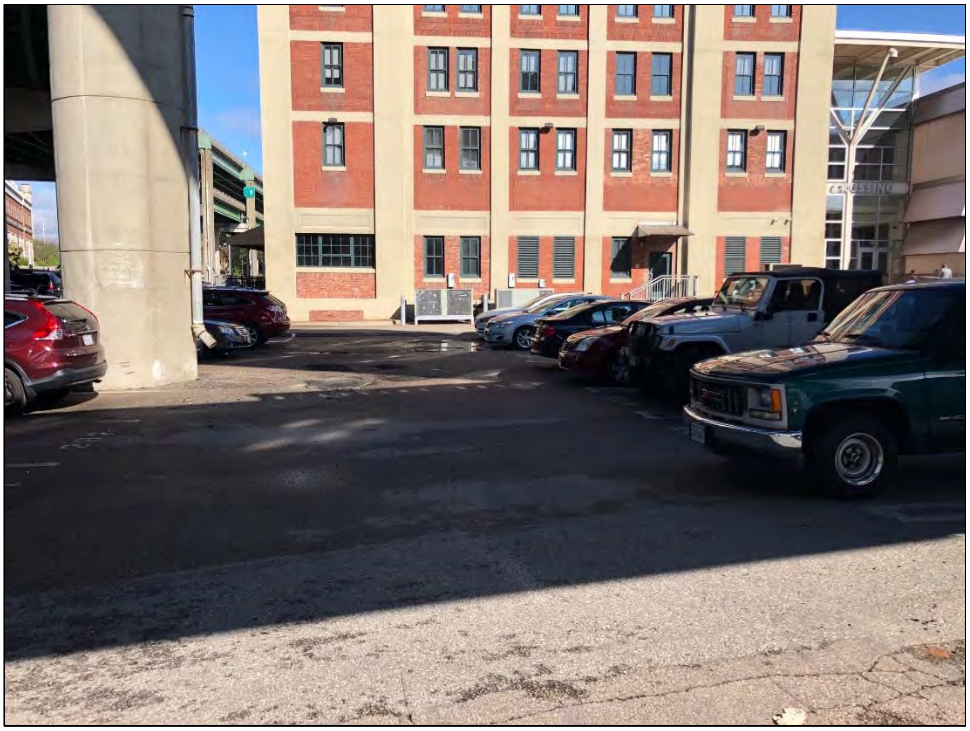

FIGURE 4-227: OVERVIEW OF SITE 44HE1094, LOOKING WEST

Sites 44HE1097 and 44HE1098, located west of Main Street Station in Richmond, were also identified during archaeological work in advance of the Richmond Floodwall project in the early 1990s (see Figure 4-225). Both sites are currently recorded in DHR site records as being unevaluated for NRHP listing. DHR site files note site 44HE1097 as a railroad warehouse dating to the nineteenth century. DHR files further state that artifacts were collected from the site during monitoring associated with the floodwall construction, but do not elaborate on the type or number of materials collected. Site 44HE1098 is classified as a railroad site, but no other information is noted about the site's function or time period. The site was located during excavation and construction of the floodwall, and it was subjected to surface collection efforts during construction. Again, the type or number of materials collected is not recorded. Both sites are currently located underneath a paved parking lot adjacent to Main Street Station (Figure 4-228).

Given their location within paved parking lots and extant building, Phase IB subsurface investigations were not undertaken at these sites, as such the subsurface integrity of these sites is unknown as a result of this survey. Other excavations in the immediate vicinity of these sites have demonstrated that cultural deposits have the potential to be preserved, buried under modern and historic fill (Laird 2006, 2010). Based on the potential for buried cultural deposits within these site locations and the inability for the Phase IB methodology of this investigation to adequately assess the integrity of any potential deposits, **it is recommended that sites 44HE1094, 44HE1097, and 44HE1098 are potentially eligible for listing in the NRHP under Criterion D.**

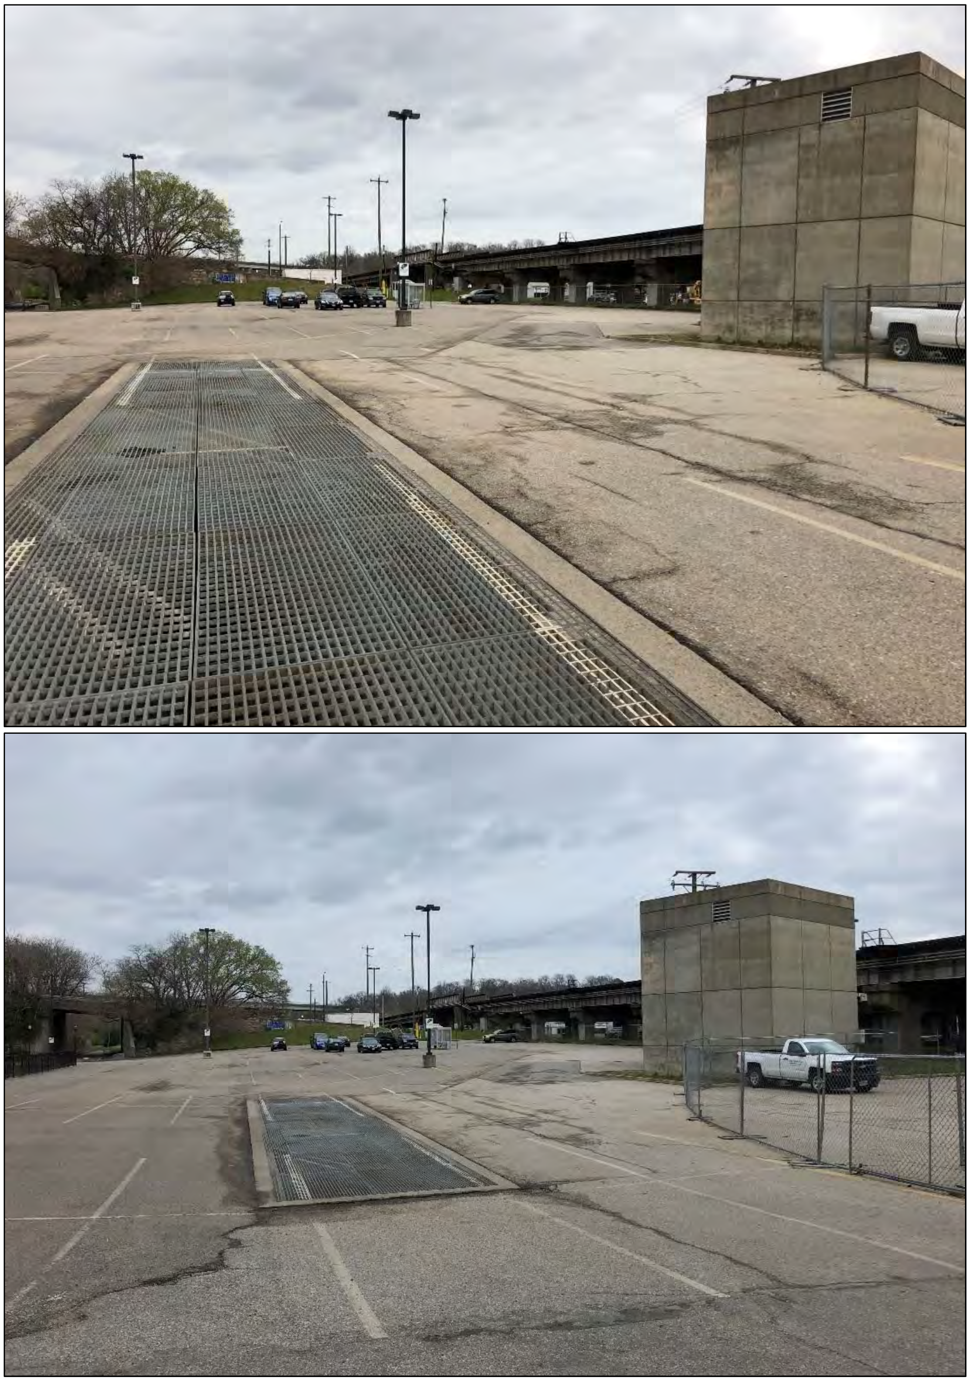

FIGURE 4-228: OVERVIEW OF SITE 44HE1098, LOOKING NORTH (TOP); OVERVIEW OF SITES 44HE1097 AND 44HE1098, LOOKING NORTH (BOTTOM)

4.7.11 Previously Recorded Site 44CF0022

Site 44CF0022 is listed as an Archaic lithic scatter with a Woodland component that has not been evaluated for NRHP listing. The majority of the site is mapped to the east of the project area (Figure 4-229). The portions of the site lying within the APE are situated within the steeply sloped margins along I-95 and the substantially lower-lying CSXT rail line (Figure 4-230). To obtain some information about this site, STPs were placed on a somewhat level area on the side of this slope. Five STPs were excavated and all contained deflated soils, with a thin topsoil, less than 0.1 feet (3.0 cm) in all STPs transitioning into gravelly sandy clay subsoil. No artifacts were recovered and no features identified. As the majority of the site lies outside the current project area, it is **recommended that the site remain unevaluated**. However, given the highly eroded soils and widespread grading and road disturbance within Site 44CF0022 as it overlaps the current project area **it is recommended that those portions of the site lying within the project area do not contribute to potential NRHP eligibility under Criterion D.**

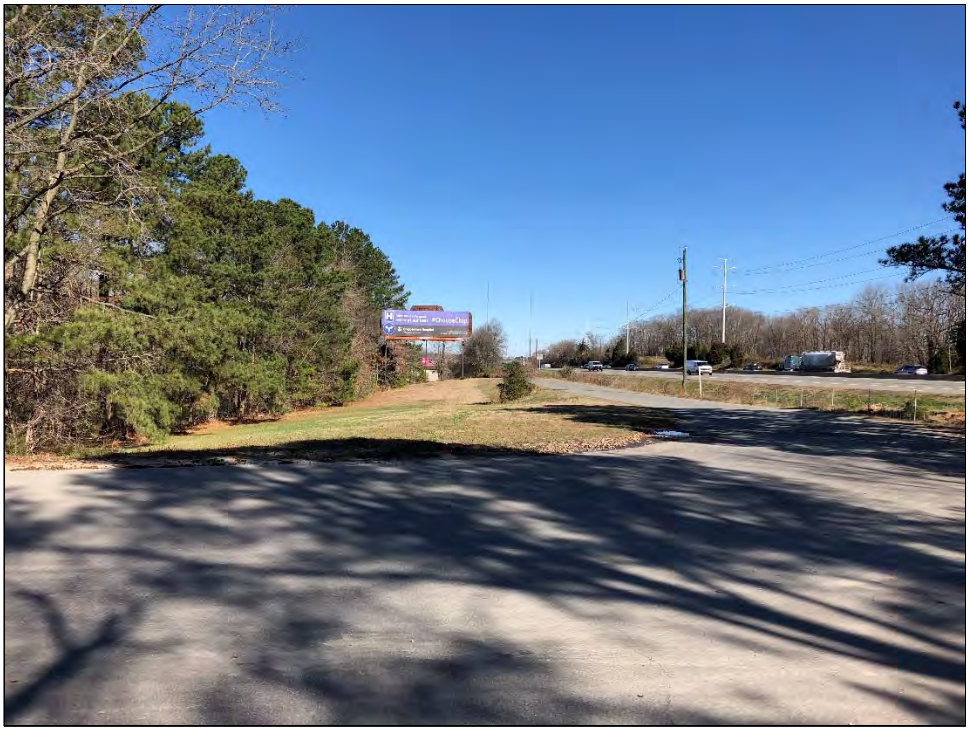

FIGURE 4-230: OVERVIEW OF SITE 44CF0022 WITHIN APE, LOOKING NORTH

4.7.12 Previously Recorded Site 44CF0123

Site 44CF0123, the Maury Street site, is an unevaluated multicomponent site with Early Woodland and nineteenth-century components, described as a prehistoric camp and historic dwelling. The portions of the site within the APE are located within heavily disturbed and graded areas owned by Richmond public utilities and in the artificially sloped surfaces associated with the Richmond Floodwall network (see Figure 4-225 and Figure 4-231). The extensive disturbance of the site within the current project area precluded subsurface testing, but observable conditions indicate that it is unlikely that intact archaeological deposits remain in those portions of the site. Because a substantial portion of the site lies outside the current survey area it is recommend that the site as a whole remain unevaluated, but given the conditions within the project area **it is recommended that those portions of 44CF0123 lying within the project area do not contribute to potential NRHP eligibility under Criterion D.**

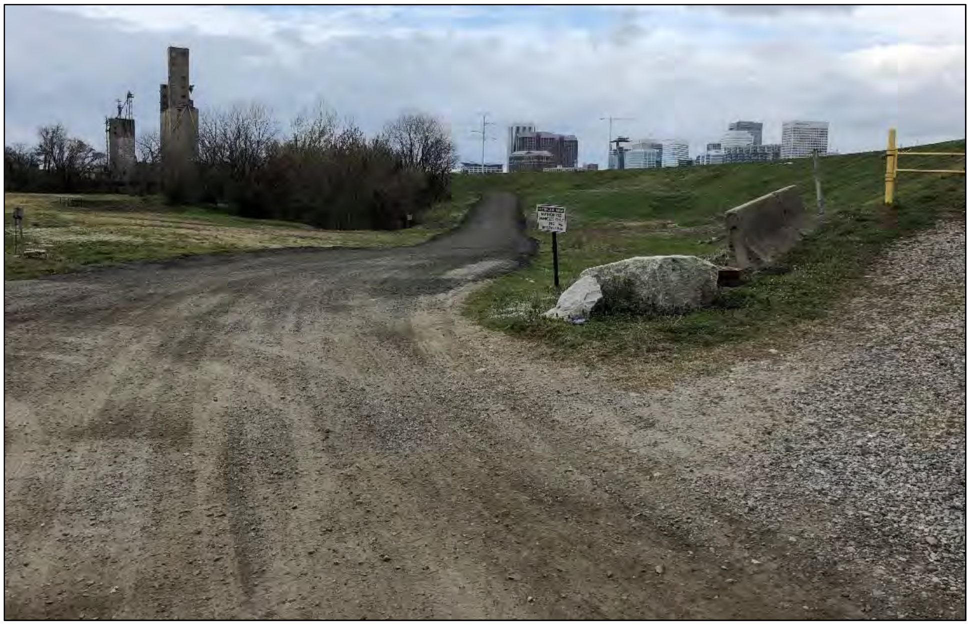

FIGURE 4-231: OVERVIEW OF SITE 44CF0123 WITHIN APE, LOOKING WEST

4.7.13 Previously Recorded Site 44CF0260

Site 44CF0260, a surface scatter of prehistoric lithics, lies on the south side of State Route 288, within a graded area between the SR 288 onramp and a large retention pond (Figure 4-232). A very small section of the site is situated within Archaeological Area 6h of the current investigation. A pedestrian survey of the site location was conducted and found that the area in which the site is located has little integrity remaining (Figure 4-233). The site was originally recorded as a surface scatter, but pedestrian survey identified no artifacts or features present on the ground surface. Based on the results of the pedestrian survey, no subsurface testing was conducted within the site area. Because a substantial portion of the site lies outside the current survey area, it is recommended that the site as a whole remain unevaluated, but given the conditions within the project area **it is recommended that those portions of 44CF0260 lying within the project area do not contribute to potential NRHP eligibility under Criterion D.**

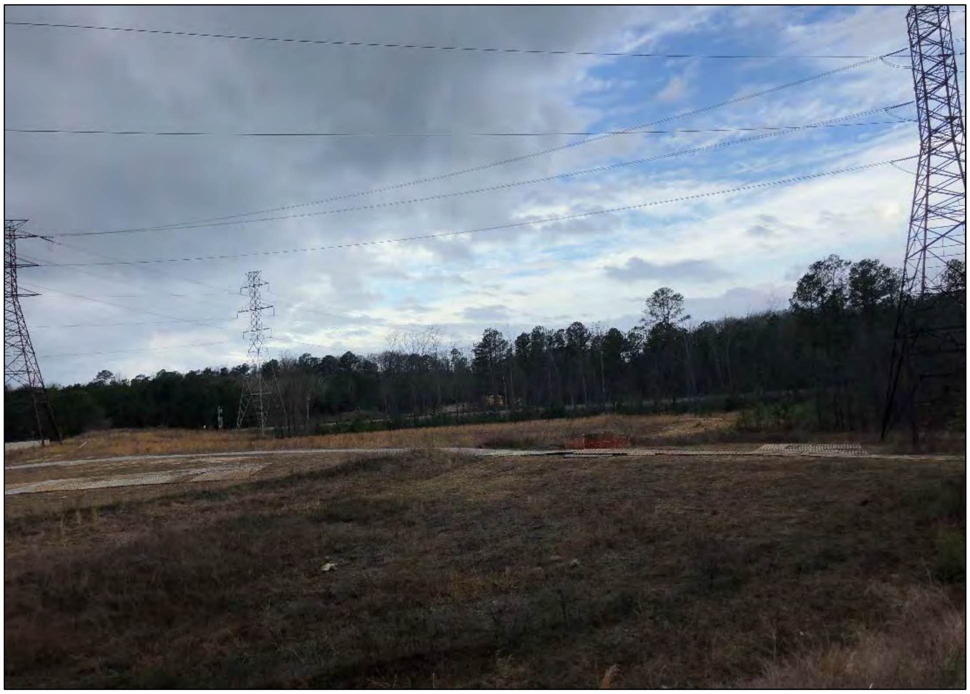

FIGURE 4-233: OVERVIEW OF SITE 44CF0260 WITHIN APE, LOOKING SOUTH

4.7.14 Previously Recorded Site 44CF0680

Site 44CF0680, Fort Darling or Centralia Earthworks site, is a large complex of earthworks and other encampment features associated with the Civil War activity south of Richmond. DHR has determined this site to be eligible for the NRHP under Criteria A and C, and it is associated with architectural resource 020-0022. Archaeological Area 6h intersects the mapped extent of previously recorded site 44CF0680 in three locations, but no evidence of visible earthworks could be seen from the project corridor at any location (see Figure 4-220 and Figure 4-234). This resource, taken as a whole, was recommended in the McCloskey et al. (2016) to be eligible for the NRHP under Criteria A and C, and DHR concurred with this recommendation in a letter dated October 11, 2016. Because of its notable association with the Civil War and preservation in other locations, **it is recommended that site 44CF0680 remains eligible for the NRHP under Criteria A and C. The subsurface integrity of the segments of the site overlapping the APE, however, have been compromised by the railroad construction and lack any visible evidence of earthworks, as such the portions of this site within the APE do not contribute to overall site eligibility.**

4.7.15 Newly Identified Site 44HE1202

4.7.15.1 Site Description

Site 44HE1202 is located in a small wooded area on the eastern side of the CSXT rail line, between the rail and Mayfair Avenue, just south of Hungary Road in Glen Allen, Henrico County (Figure 4-235). This site appears to be a refuse scatter dating to the twentieth century (Figure 4-236). The site was initially identified during STP survey, via the recovery of 22 artifacts in five STPs. The site was bounded by negative STPs to the north and west, disturbance to the east and the project boundary to the south. Though no structural remains of a house or other building were observed within the project area, periwinkle abounded in the vicinity of the positive STPs, which could be indicative of intentional planting by historic occupants, suggesting the possibility of a house site.

Ground surfaces in and around the site show substantial signs of disturbance, and the soils and inundation nearby indicate that the area may occasionally be flooded. The area is generally characterized by level topography and young deciduous trees, with a dense understory of vines and brambles, as well as the aforementioned periwinkle ground coverage. Site 44HE1202 measures approximately 110 feet (33.5 feet) north to south and 50 feet (15.2 m) east to west, encompassing an area of 0.1 acres (404 m). Site 44HE1202 lies at 215.4 feet (65.7 m) AMSL.

The assemblage recovered from site 44HE1202 includes 22 artifacts dating to the early-twentieth century. The artifacts primarily include clear, brilliant green, and aqua bottle glass likely representing casual discard rather than being indicative of a domestic occupation. Additional materials include nails, both machine-cut and those of indeterminate manufacturing, window glass, and a fragment of ironstone.

FIGURE 4-236: GENERAL VIEW OF SITE 44HE1202, FACING NORTH

The average depth of STPs within the site was 1.3 feet (39.6 cm), with the deepest STP also extending to a depth of 1.3 feet (39.6 cm). The average A horizon measured 0.8 feet (24.4 cm). The maximum A-horizon measurement within the site measured 0.9 feet (27.4 cm). The typical STP within the site contained two levels. Stratum I consists of a black (2.5Y 2.5/1) sandy loam which overlaid a subsoil consisting of a light yellowish brown (10YR 6/4) sandy clay (Figure 4-237).

FIGURE 4-237: REPRESENTATIVE STP PROFILE FOR SITE 44HE1202

4.7.15.2 Evaluation and Significance

Site 44HE1202 is likely a twentieth-century refuse scatter. Given the lack of evidence for a structure in the site boundaries and the widespread disturbance, as well as the abundance of sites dating to this period, it is unlikely that the site would yield significant information about twentieth-century occupation of the Glen Allen area, as such the site is not eligible for NRHP listing under criterion D. Nor is the site associated with a historical event or pattern of events (Criterion A) or significant persons (Criterion B) and the deposits do not illustrate distinctive characteristics of a type, period, or method of construction (Criterion C). As such, it is **recommended that site 44HE1202 is not eligible for NRHP listing.**

4.7.16 Newly Identified Site 44HE1203

4.7.16.1 Site Description

Site 44HE1203 is located in an urban setting (Figure 4-238 and Figure 4-239) on the west side of the CSXT rail line, along Hospital Street in Richmond, within the northern portion of Archaeological Area 6e. This site represents the "Grave Yard for Free People of Color and Slaves" identified solely based on current historic map analysis. The site was identified based on the Micajah Bates 1835 *Plan of the City of Richmond Drawn From Actual Survey and Regional Plans* (Figure 4-239). Phase IB pedestrian survey of this portion of the APE indicated near-surface disturbance to the site location from buried utility corridors, modern development of the location, and construction associated with the modern alignment of Hospital Street. Given the presence of multiple near-surface disturbances, no subsurface testing was undertaken at the location and thus, no subsurface deposits associated with the site have been identified. The site, as defined from historic map analysis, measures 350 x 500 feet (106.7 x 152.4 m), encompasses an approximate area of 3.3 acres (1.3 ha), and is located at approximately 105 feet (32 m) AMSL.

Further evidence of the presence of the "Grave Yard for Free People of Color and Slaves" as noted by Bates (1835) comes from previous archaeological investigations undertaken in advance of the proposed widening of I-64, of which the project area partially overlaps the DC2RVA archaeological APE (Calhoun 2013). The archaeological investigation, completed on behalf of VDOT, included the excavation of a series of backhoe trenches used to assess the stratigraphy and presence of archaeological features within the 0.68-acre (0.28-ha) project area. Extensive documentary, map, and background research as to the location and extent of the purported cemetery was conducted by VDOT in advance of the archaeological investigation (Calhoun 2013). The study noted that the cemetery location shows up intermittently on maps of city, including Beers (1877), Ellyson (1856), and Michler (1867). Documentary evidence of the cemetery was also noted in Richmond City Council Minutes from 1816 and an advertisement in the *Richmond Enquirer* in 1816 (see images in Calhoun 2013). In a discussion of the documentary evidence, Calhoun speculated that the interments may have been moved from the cemetery location to make way for the 1890 construction of the 5th Street Viaduct (now the Stonewall Jackson Bridge) and were reinterred in the graveyard at the Richmond Penitentiary. An excerpt from this report outlines the speculation on the individuals buried at the cemetery:

> Burying Ground were removed prior to, or during, the construction of the 1890 viaduct and that [sic] they were reinterred in the graveyard at the Richmond Penitentiary. The Richmond Penitentiary closed in the early 1990s, and all of the graves were removed from the property and it was sold. During the archaeological exhumation, it was noted that dispersed amongst the prison burials were some that contained more than one individual and that were not consistent with other burials at the penitentiary. Kathy Biedleman, who directed the project, stated that she accessed records that indicated that these burials were originally interred in the Burying Ground and that when the viaduct was constructed in 1890, they were moved to the penitentiary (Interview with Robert Clarke). Unfortunately, the research conducted for the purpose of this report did not discover any records that substantiate this claim, and the several attempts to contact Ms. Biedleman have been unsuccessful. [Calhoun 2013]

Despite overwhelming documentary evidence of the cemetery, no physical archaeological evidence was documented in the 2013 project area. Instead the geoarchaeological assessment indicated that the project area stratigraphy consisted of vary degrees of modern fill deposited on top of truncated ancient marine soils. The documentary and geoarchaeological analysis indicated that if the cemetery remains intact, that it was likely located at the crest of the valley slope immediately east of the extant Shockoe Hill Cemetery (127-0389) and Hebrew Cemetery (127-6166). This location, as proposed by Calhoun (2013), is currently recorded as an above-ground resource, Talley's Auto Service Center, located at 1305 N 5th Street (127-6660).

4.7.16.2 Evaluation and Significance

Site 44HE1203 is a nineteenth-century "Grave Yard for Free People of Color and Slaves" as identified by Bates 1835. According to documentary evidence it was established circa 1816 and likely abandoned circa 1890. No subsurface excavations were conducted within the cemetery area, as such the cemetery has not been delineated. Pedestrian survey of the cemetery area within the current APE indicated a variety of modern disturbances. The APE within the site area is confined to the sidewalks north of Hospital Street, the road itself, and the slope immediately south of Hospital Street. Pedestrian survey of the site location indicates that the disturbance noted within the APE, most notably the grading needed to construct Hospital Street (approximately 10 feet [3 m]) would have disturbed the cemetery location (Figure 4-240). As such, **the portion of site 44HE1203 within the APE lacks subsurface integrity and therefore does not contribute the site's overall NRHP eligibility.** However, it is **recommended that site 44HE1203 should be considered unevaluated for the NRHP** as no subsurface investigations within site location have been undertaken. It is further noted that Calhoun's (2013) recommendation that if the cemetery remains intact, it would likely be located at the crest of the valley slope under the footprint of current Tallys Auto Shop, remains valid (Figure 4-241). The current survey noted that the crest of the valley slope, to the north of the current APE, appeared visually intact and not subjected to the extensive grading observed in the portion of the site within the APE.

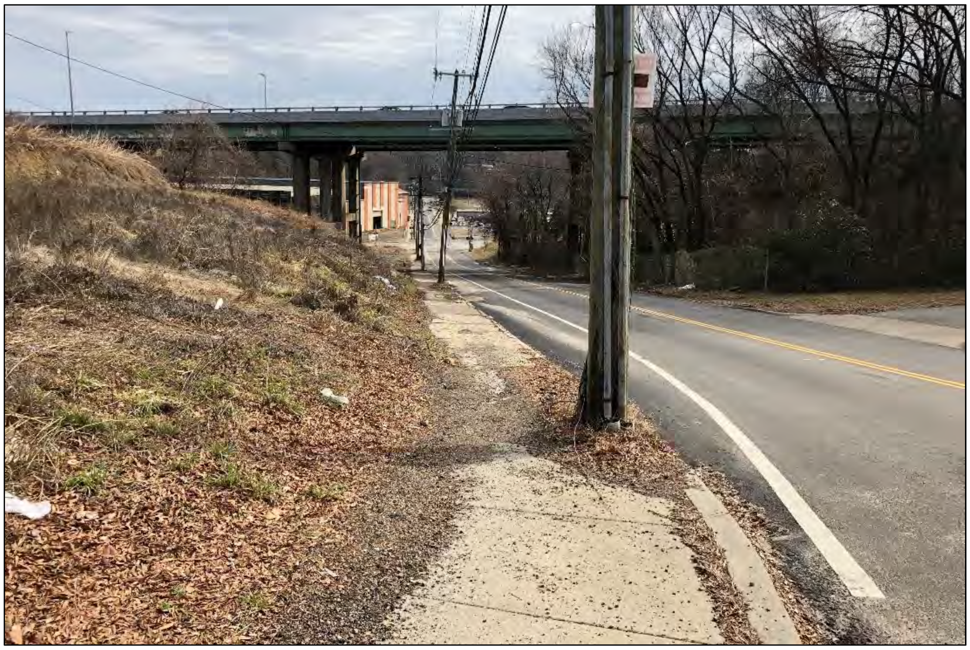

FIGURE 4-240: OVERVIEW OF SITE 44HE1203 NOTING GRADING OF HOSPITAL STEET, LOOKING EAST

4.7.17 Newly Identified Site 44HE1204

4.7.17.1 Site Description

Site 44HE1204 is located in an urban setting (see Figure 4-238 and Figure 4-242) on the east side of the CSXT rail line, directly north of I-95, within the southern portion of Archaeological Area 6e. This site represents Carrington's Mill and associated mill race, identified based solely on historic map analysis. The site was identified based on the Micajah Bates' 1835 *Plan of the City of Richmond Drawn From Actual Survey and Regional Plans* and also noted on the F.W. Beers' 1877 *Map of the City of Richmond*. Phase IB pedestrian survey of this portion of the APE indicated near-surface disturbance to the site location from buried utility corridors, modern development of the location, and construction associated with the modern alignment the railway (Figure 4-243). Based on the presence of multiple surface disturbances, no subsurface testing was undertaken at the location and thus no subsurface deposits associated with the site have been identified. The site, as defined from historic map projection, measures 1,400 x 150 feet (426.7 x 45.7 m), encompasses an approximate area of 1.8 acres (0.7 ha), and is located at approximately 90 feet (27.4 m) AMSL.

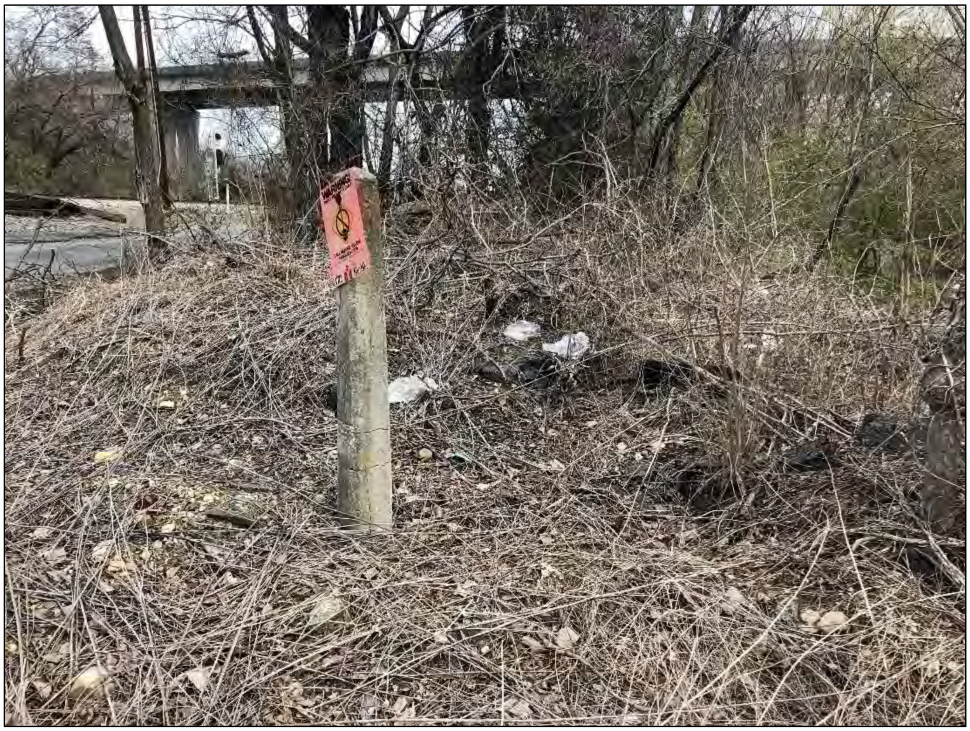

Figure 4-243: Overview of Site 44HE1204, Noting BURIED UTILITY Corridor, MODERN Road, AND RAILROAD Disturbance, Looking Southeast

Carrington's Mill first appears on the 1835 Bates maps and preliminary research was unable to define how long the mill had been operational by this time. The map shown in Figure 4-242 indicates the canal running south from Shockoe Creek, the location of the mill wheel evidenced by the gap between the canal and the mill building, the mill building itself, and associated mill race. Research indicates that Colonel George M. Carrington owned the mill as well as the surrounding property and employed Anthony Victor as his manager/proprietor of the mill operations (*Richmond Enquirer* 1850). Based on advertisements in the *Richmond Enquirer* it seems that Carrington's was a grist mill that also facilitated the storage of ice for the public. On May 14, 1847, a notice was placed in the *Richmond Enquirer* stating that Carrington's Mill would accept deposits of ice for the public and in 1849, Anthony Victor placed notices that "2,000 bbls best white corn wanted at Carrington's Mill, which the highest cash price will be given" (*Richmond Enquirer* 1847 and 1849). While the mill suffered notable damages from a flood in the summer of 1850, newspaper accounts in the years following suggest that Colonel Carrington repaired and rebuilt to continue his operation. However, this would seemingly not last long. On March 17, 1852, notice was placed in the *Richmond Times Dispatch* that Colonel Carrington's proprietor, Anthony Victor, was charged with shooting a man in the face over a young lady that was living in the house with Mr. Victor (*Richmond Times Dispatch* 1852). Victor was eventually charged with feloniously shooting a man and was sentenced to confinement in the penitentiary for three years (*Richmond Enquirer* 1852).

By 1854, the mill is referenced as "Carrington's Old Mill" indicating the mill was no longer operational. A specific notice in the *Richmond Times Dispatch* on June 24, 1854 mentions "a gang of little boys…who are in the habit of bathing in Shockoe Creek…..While the officers are endeavoring to break up this indecent habit on the part of the boys, we will suggest to them the property of having an eye to the pond at Carrington's old mill, where grown men congregate of evenings to bathe" (*Richmond Times Dispatch* 1854). Three years later, Colonel Carrington passed away with all of his personal possessions and presumably his real estate being sold at auction (*Richmond Times Dispatch* 1857).

4.7.17.2 Evaluation and Significance

Site 44HE1204 is an early-nineteenth-century mill site as identified by Bates 1835. According to documentary evidence it was established circa 1835 and likely abandoned by the 1850s. No subsurface excavations were conducted within the location of the mill site and, as such, the mill and associated infrastructure have not been delineated. Pedestrian survey of the mill site within the current APE indicated a variety of modern disturbances. The APE within the site area is confined to a wooded parcel along CSXT right-of-way. Pedestrian survey of the site location indicates that the disturbance noted within the APE, most notably buried utility corridors, modern development, and construction associated with the modern alignment the railway would have removed any trace of the former mill site. As such**, the portion of site 44HE1204 within the APE lacks subsurface integrity and therefore cannot contribute the site's overall NRHP eligibility.** However, it is **recommended that site 44HE1204 should be considered unevaluated for the NRHP** as no subsurface investigations within the site location have been undertaken.

5 SUMMARY AND RECOMMENDATIONS

The proposed DC2RVA preferred alternative of the SEHSR project was examined through a Phase IB archaeological survey. The proposed project is being completed under the auspices of the FRA in conjunction with the DRPT. Because of the FRA's involvement, the undertaking is required to comply with the NEPA of 1969 and Section 106 of the National Historic Preservation Act of 1966, as amended. The project is being completed as DHR File Review #2014-0666.

The archaeological APE for the DC2RVA project includes the footprint of physical improvements associated with the project, inclusive of both the rail modifications and any associated roadwork. The APE of the mainline was the subject of archaeological survey in 2015 and 2016. The results were summarized in a report (McCloskey et al. 2016) and submitted to the DHR for review. Since the conclusion of the previous Phase IB archaeological work, a draft EIS resulting in the selection of a Preferred Alternative has been completed. Additionally, engineering and design work has been completed for the corridor resulting in the definition of the physical footprint of improvements for the selected Preferred Alternative, including all road modifications, straightening of curves, the addition of wyes, proposed station locations, parking areas, etc. As such, the APE studied as part of the current report was defined by the LOD of the Preferred Alternative, and is generally located along the existing 123-mile (198-km) CSXT rail corridor. The goals of the Phase IB survey were to identify archaeological sites greater than 50 years in age and to provide an initial assessment of the physical integrity and research potential of any archaeological sites discovered within the APE in relation to potential NRHP eligibility.

The archaeological study consisted of a pedestrian survey and subsurface testing, supplemented by metal detector survey, throughout the APE beyond the limits of previous Phase IB investigations. Based on the pedestrian survey, subsurface testing (and, where necessary, metal detector survey) was carried out in locations deemed to have potential for intact subsurface deposits. Additionally, all sites within the APE not addressed by the previous DC2RVA Phase IB archaeological study, determined eligible or potentially eligible for listing in the NRHP, and those previously recorded sites that had not been evaluated by the DHR were examined. The archaeological areas subjected to Phase IB study, inclusive of pedestrian and subsurface testing, encompass 158.8 acres (64.3 ha).

A total of 511 STPs was excavated within areas identified for Phase IB study along the 123-mile-long (198-km) APE. The excavation of shovel tests and metal detector hits resulted in the recovery of 140 artifacts that date predominantly to the historic period. Two locations identified for Phase IB study were not accessible at the time of the current investigation. The inaccessible portions of Archaeological Area 2k (off Union Camp Road in Stafford County) and Archaeological Area 3e (along Benchmark Road in Spotsylvania County) are not included within the results and recommendations presented in the scope of this report.

Phase IB survey resulted in the identification of 23 archaeological sites and 5 isolated finds within the surveyed portions of the APE (Table 5-1). Of these 23 archaeological sites, 17 were previously identified archaeological sites and 6 were newly recorded. Based on this survey it is **recommended that one site, 44CF0680, remains eligible for listing in the NRHP under Criteria A and C. However, the portion of site 44CF0680 within the APE does not contribute to overall site eligibility.** The survey identified **nine archaeological sites (44HE0357, 44HE1097, 44HE1098, 44HE1094, 44SP0187, 44SP0468, 44SP0687, 44SP0688, and 44ST1223) that are recommended potentially eligible for listing in the NRHP under Criterion D.** It is further **recommended that nine sites (44CF0022, 44CF0123, 44CF0260, 44HE1203, 44HE1204, 44PW1008, 44ST0011, 44ST0270, and 44ST0271) are or remain unevaluated for the NRHP, but that the portions of all these sites within the APE do no contribute to their overall site eligibility**. The remaining **four archaeological sites (44HE1202, 44SP0767, 44SP0768, and 44ST1224,) are all recommended not eligible for listing in the NRHP**. However, sites 44ST1224 and 44SP0786 are both small family cemeteries that have not been fully delineated, so they should be avoided or their boundaries defined.

TABLE 5-1: SUMMARY OF IDENTIFIED ARCHAEOLOGICAL SITES

DC2RVA Project Area	DHR Number	Type	Recommendation
2f	44PW1008	Indeterminate Type or Age	Unevaluated; Portion in APE does not contribute to Eligibility
2k	44ST1223	Civil War Campsite; Nineteenth Century	Potentially Eligible under Criterion D
2k	44ST1224/ 089-5624	Daffan Family Cemetery; Mid-Nineteenth Century	Not Eligible
2k	44ST0271	Civil War Camp; Nineteenth Century	Unevaluated; Portion in APE does not contribute to Eligibility
2k	44ST0270	Civil War Camp; Nineteenth Century	Unevaluated; Portion in APE does not contribute to Eligibility
3a	44ST0011	Indeterminate; Unknown Prehistoric and Colonial	Unevaluated; Portion in APE does not contribute to Eligibility
3b	44SP0187	Marye's Mill; Nineteenth Century	Potentially Eligible under Criteria A and D
3b	44SP0687	Fredericksburg Block 48; Late Archaic through Twentieth Century	Potentially Eligible under Criterion D
3b	44SP0688	Fredericksburg Block 49; Late Archaic through Twentieth Century	Potentially Eligible under Criterion D
3d	44SP0468	Jackson's Earthwork-Encampment; Nineteenth Century	Potentially Eligible under Criteria A and D
3f	44SP0768/ 088-5511	Family Cemetery and Artifact Scatter; Twentieth Century	Not Eligible
3f	44SP0767/ 088-5516	Civil War Earthwork; Nineteenth century	Not Eligible
6a	44HE1202	Refuse Scatter; Twentieth Century	Not Eligible

TABLE 5-1: SUMMARY OF IDENTIFIED ARCHAEOLOGICAL SITES

DC2RVA Project Area	DHR Number	Type	Recommendation
6e	44HE1203	Cemetery: "Grave Yard for Free People of Color and Slaves"; Nineteenth Century	Unevaluated; Portion in APE does not contribute to Eligibility
6e	44HE1204	Carrington's Mill; Early-Nineteenth Century	Unevaluated; Portion in APE does not contribute to Eligibility
6e	44HE0357	Privy/Pit Complex; Eighteenth through Nineteenth Century	Potentially Eligible under Criterion D
6e	44HE1097	Railroad Warehouse; Nineteenth Century	Potentially Eligible under Criterion D
6e	44HE1098	Railroad Site; Indeterminate Age	Potentially Eligible under Criterion D
6e	44HE1094	Commissary Warehouse; Nineteenth Century	Potentially Eligible under Criterion D
6f	44CF0123	Camp and Dwelling; Early Woodland and Nineteenth Century	Unevaluated; Portion in APE does not contribute to Eligibility
6g	44CF0022	Lithic Scatter; Archaic through Woodland	Unevaluated; Portion in APE does not contribute to Eligibility
6h	44CF0260	Lithic Scatter; Unknown Prehistoric	Unevaluated; Portion in APE does not contribute to Eligibility
6h	44CF0680	Fort Darling/Centralia Earthworks; Nineteenth Century	Eligible under Criteria A and C; Portion in APE does not contribute to Eligibility

Re: Request for Permit to Conduct Archaeological Investigations on State-Controlled Land
Southeast High Speed Rail Project - DC2RVA Section
Leesylvania State Park, Prince William County, VA
DHR File No. 2014-0666

Dear Ms. Barile:

Thank you for your request for permission to conduct field investigations on state-controlled lands. Find enclosed the requested permit. This permit is valid for the investigations as described in the approved research design. Please be aware that there are several conditions that must be met to satisfy the permit requirements, and these are listed in the permit.

The permit is valid for a period of one year dating from February 20, 2018. According to the stipulations of the permit, a final report of all investigations is due in the Department by February 20, 2019. This report should thoroughly document the findings of this archaeological work and provide recommendations on the need for and scope of additional work.

Should there be extenuating circumstances that make you unable to meet the conditions of this permit, please contact the Department. If you have any questions concerning the stipulations of the permit, or if we may provide any further assistance, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,

Roger W. Kirchen, Director
Review and Compliance Division

Re: Permit to Conduct Archaeological Investigations on State-Controlled Land
Southeast High Speed Rail Project - DC2RVA Section
Leesylvania State Park, Prince William County, VA
DHR File No. 2014-0666

Dear Ms. Barile:

Thank you for your request for permission to conduct field investigations on state-controlled lands. In accordance with §10.1-2300 of the *Code of Virginia*, the Virginia Antiquities Act, effective July 1, 1989, the Department of Historic Resources ("Department") on this 20th day of February, 2018 hereby grants to Kerri Barile ("Permittee") of the Dovetail Cultural Resource Group permission to conduct archaeological investigations at Leesylvania State Park in Prince William County in support of the Southeast High Speed Rail Project - DC2RVA Section. This permit is to be considered effective as of today's date.

The granting of this permit signifies that:

1. The Department finds that granting the permit is in the best interests of the Commonwealth;

2. The Department finds that the archeologist selected to perform the work is qualified pursuant to §10.1-2302(B) of the *Code of Virginia* to conduct these investigations;

3. The Department has received from the Permittee acknowledgement that all materials resulting from the study, including artifacts, field records and photographs, are the property of the Commonwealth of Virginia in accordance with §10.1-2302(C); and

4. The Department has received from the Permittee and has approved, pursuant to §10.1-2302(D), a statement detailing the goals and objectives of the project and the proposed research strategy.

Western Region Office
962 Kime Lane
Salem, VA 24153
Tel: (540) 387-5443
Fax: (540) 387-5446

Northern Region Office
5357 Main Street
PO Box 519
Stephens City, VA 22655
Tel: (540) 868-7029
Fax: (540) 868-7033

Eastern Region Office
2801 Kensington Avenue
Richmond, VA 23221
Tel: (804) 367-2323
Fax: (804) 367-2391

This permit is granted subject to the following conditions:

1. The Permittee shall ensure that the proposed field investigations are carried out in strict accordance with the approved research statement referred to in Item 4 above, or shall obtain the prior written approval of the Department for any change;

2. The Permittee shall ensure that the Department is informed in writing of the initiation and completion of field work, and allow inspections by representatives or designees of the Department as determined necessary by the Department;

3. The Permittee shall ensure that, at the conclusion of the project, a Virginia State Archaeological Site Inventory form is completed for any identified site or updated for existing sites. All inventory forms shall be submitted to the Department in an electronic format consistent with the Department's Virginia Cultural Resource Information System (VCRIS) at the end of the field investigations and prior to submission of any technical reports;

4. The Permittee shall ensure that a technical report of the investigations is prepared upon completion of all field investigations under this permit. The report shall meet the federal standards entitled *Archeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines* (48 FR 44716-44742, September 29, 1983) and the Department's *Guidelines for Conducting Historic Resources Survey in Virginia* (rev. 2017). One bound hardcopy and one digital copy of the report shall be submitted to the Department for review and comment;

5. All artifacts recovered as a consequence of the investigations conducted under this permit shall be placed in the collections of the Department upon completion of the study and shall be curated (with the exception of any items used for appropriate exhibit purposes) in accordance with the Department's *State Curation Standards*;

6. The archeologist selected to perform the work shall carry a copy of the permit during all fieldwork;

7. The Permittee shall consult with the Department in the event that human remains are identified during work performed under this permit;

8. The Department reserves the right to revoke this permit upon the initiative of the Director, or upon the request of any interested party for violations of any of the above conditions, or if good cause is demonstrated; and

9. This permit shall be valid for one year from the date of issuance. This permit is not transferable.

If you have any questions regarding this permit and its conditions, or if you require any further assistance, please do not hesitate to contact Roger Kirchen of our project review division at email roger.kirchen@dhr.virginia.gov.

Sincerely,

Julie V. Langan

Organization/Company:	Dovetail CRG
Investigator:	Kevin McCloskey
Survey Date:	2/4/2018

Survey Description:

Dovetail 2018: The current archaeological study included a Phase IB survey of the preferred alternative limits of disturbance (LOD) (Arlington [Area 1] through Richmond [Area 6]) of the DC2RVA corridor. The DC2RVA corridor has been the subject of ongoing cultural resource investigations from 2014 to present, including a Phase IA archaeological background review and archaeological predictive model (Klein at al. 2015) and a Phase IB archaeological survey of the mainline based on modeling (McCloskey et al. 2016). The archaeological area of potential effects (APE) for the DC2RVA project includes the footprint of physical improvements associated with the project, inclusive of both the rail modifications and any associated roadwork. Since the conclusion of the previous Phase IB archaeological work, a draft environmental impact statement resulting in the selection of a Preferred Alternative has been completed. Additionally, engineering, and design work has been completed for the corridor resulting in the definition of the physical footprint of improvements for the selected Preferred Alternative, including all road modifications, straightening of curves, the addition of wyes, proposed station locations, parking areas, etc. As such the APE studied as part of the current report was defined by the LOD of the Preferred Alternative, specifically defined as an area e generally along the existing 123-mile (198-km) CSX Transportation (CSXT) rail corridor. The archaeological study consisted of a pedestrian survey and subsurface testing with STPs placed at 50-foot intervals, supplemented by a metal detector survey, where needed, throughout the APE beyond the limits of previous Phase IB investigations.

Current Land Use	**Date of Use**	**Comments**
Forest	3/1/2018 12:00:00 AM	(Calhoun 2018) The site is located in a small wooded area on the eastern side of the CSXT rail line, between the rail and Mayfair Avenue, just south of Hungary Road in Glen Allen, Henrico County.

Threats to Resource:	Transportation Expansion
Site Conditions:	25-49% of Site Destroyed
Survey Strategies:	Observation, Subsurface Testing
Specimens Collected:	Yes
Specimens Observed, Not Collected:	No

Artifacts Summary and Diagnostics:

The assemblage recovered from the site includes 22 artifacts dating to the early-twentieth century. The artifacts primarily include clear, brilliant green, and aqua bottle glass likely representing casual discard rather than being indicative of a domestic occupation. Additional materials include nails, both machine-cut and those of indeterminate manufacturing, window glass, and a fragment of ironstone.

Survey Report Information:

Dovetail 2018: McCloskey, Kevin, Emily Calhoun, Kerry Gonzalez, and Mike Klein Phase IB Archaeological Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Preferred Alternative Limits of Disturbance

Survey Report Repository:	DHR
DHR Library Reference Number:	No Data
Significance Statement:	The site is a twentieth-century refuse scatter. Given the lack of evidence for a structure in the site boundaries and the widespread disturbance, as well as the abundance of sites dating to this period, it is unlikely that the site would yield significant information about twentieth-century occupation of the Glen Allen area, as such the site is not eligible for NRHP listing under criterion D. Nor is the site associated with a historical event or pattern of events (Criterion A) or significant persons (Criterion B) and the deposits do not illustrate distinctive characteristics of a type, period, or method of construction (Criterion C). As such, it is recommended that the site is not eligible for NRHP listing.

Survey Date:	2/4/2018

Survey Description:

Dovetail 2018: The current archaeological study included a Phase IB survey of the preferred alternative limits of disturbance (LOD) (Arlington [Area 1] through Richmond [Area 6]) of the DC2RVA corridor. The DC2RVA corridor has been the subject of ongoing cultural resource investigations from 2014 to present, including a Phase IA archaeological background review and archaeological predictive model (Klein at al. 2015) and a Phase IB archaeological survey of the mainline based on modeling (McCloskey et al. 2016). The archaeological area of potential effects (APE) for the DC2RVA project includes the footprint of physical improvements associated with the project, inclusive of both the rail modifications and any associated roadwork. Since the conclusion of the previous Phase IB archaeological work, a draft environmental impact statement resulting in the selection of a Preferred Alternative has been completed. Additionally, engineering, and design work has been completed for the corridor resulting in the definition of the physical footprint of improvements for the selected Preferred Alternative, including all road modifications, straightening of curves, the addition of wyes, proposed station locations, parking areas, etc. As such the APE studied as part of the current report was defined by the LOD of the Preferred Alternative, specifically defined as an area e generally along the existing 123-mile (198-km) CSX Transportation (CSXT) rail corridor. The archaeological study consisted of a pedestrian survey and subsurface testing with STPs placed at 50-foot intervals, supplemented by a metal detector survey, where needed, throughout the APE beyond the limits of previous Phase IB investigations.

Current Land Use	**Date of Use**	**Comments**
Parking lot	3/1/2018 12:00:00 AM	(Calhoun 2018) The site is located in an urban setting on the west side of the CSXT rail line, along Hospital Street in Richmond.

Survey Report Information:

Dovetail 2018: McCloskey, Kevin, Emily Calhoun, Kerry Gonzalez, and Mike Klein Phase IB Archaeological Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Preferred Alternative Limits of Disturbance

Survey Report Repository:	DHR
DHR Library Reference Number:	No Data
Significance Statement:	(Calhoun 2018) The site is a nineteenth-century “Grave Yard for Free People of Color and Slaves” as identified by Bates (1835). According to documentary evidence it was established circa 1816 and likely abandoned circa 1890. No subsurface excavations were conducted within the cemetery area, as such the cemetery has not been delineated. Pedestrian survey of the cemetery area within the current APE indicated a variety of modern disturbances. The APE within the site area is confined to the sidewalks north of Hospital Street, the road itself, and the slope immediately south of Hospital Street. Pedestrian survey of the site location indicates that the disturbance noted within the APE, most notably the grading needed to construct Hospital Street (approximately 10 feet [3 m]) would have disturbed the cemetery location. As such, the portion of the site within the APE lacks subsurface integrity and therefore does not contribute the site’s overall NRHP eligibility. However, it is recommended that the site should be considered unevaluated for the NRHP as no subsurface investigations within site location have been undertaken. It is further noted that Calhoun’s (2013) recommendation that if the cemetery remains intact, it would likely be located at the crest of the valley slope under the footprint of current Tallys Auto Shop,

remains valid. The current survey noted that the crest of the valley slope, to the north of the current APE, appeared visually intact and not subjected to the extensive grading observed in the portion of the site within the APE.

Current Land Use	Date of Use	Comments
Forest	3/1/2018 12:00:00 AM	(Calhoun 2018) The cemetery is located in a densely wooded area and is on the west side of the CSXT rail line and north of Summit Crossing Road, situated immediately west and north of a communications tower and associated metal pre-fabricated shed.

Threats to Resource:	Transportation Expansion
Site Conditions:	Unknown Portion of Site Destroyed
Survey Strategies:	Historic Map Projection, Observation
Specimens Collected:	Yes
Specimens Observed, Not Collected:	Yes

Artifacts Summary and Diagnostics:

(Calhoun 2018) The artifact assemblage consists of five fragments of clear bottle glass.

Summary of Specimens Observed, Not Collected:

(Calhoun 2018) Surface features noted at the site location include two engraved headstones, one footstone, four metal fence posts, and one gate post. One headstone reads “CATLETT/ Vivian 1901–1952/Shirley 1898–1948/Henry 1865–1919/Nellie 1869–1951” and the second reads “Annie Kate/ Gilchrist/ Born/October 11, 1882”. The death date on the second stone was not visible at the time of survey as it was buried, but images of the markers located in the findagrave.com database indicate the death date to be 1914 (Findagrave.com 2010). Based on the presence of these stones, it appears that a minimum of five individuals may be buried within the cemetery. Four metal fence posts and a metal gate post were observed surrounding the marked graves, although no fencing in between these posts remains

Summary of Specimens Observed, Not Collected:

(Calhoun 2018) Surface features noted at the site include five headstones, one associated footstone, and at least three unmarked interments. The first headstone reads “IN / Memory of / WILLIAM DAFFAN / DIED / April 2nd, 1855/in the 78th year of / His age.” The marker is sandstone and has an unmarked associated sandstone footstone. The second headstone, also sandstone, has an engraved circle thought to contain an angel and reads “In memory of” (the rest of the text is buried). The third sandstone marker has been damaged and is represented by detached top half and the bottom half which remains in its original location. The detached top half is decorated with a rose and reads “In memory of”. The in situ base bears the inscription “…ANN M. / BURRUS/ WIFE OF P. H. BURRUS / Caroline County/ Who died / November 22nd 1848 / 29th year of her age.”. The fourth headstone is also sandstone and reads “IN / Memory of / HUGH W. DAFFAN / DIED / Sept, 22. 1847 / In the 11 year / of his age.”. The final headstone is granite and has no discernible inscription.
In addition to the marked interments, at least three additional unmarked graves were noted during the pedestrian survey of the cemetery area. These unmarked interments were identified based on the presences of shallow rectangular depressions. Based on the presence of both marked and unmarked graves, it appears that a minimum of eight individuals may be buried within the cemetery.

APPENDIX F: QUALIFICATIONS OF THE INVESTIGATORS

Kerri S. Barile, Ph.D., RPA

Dovetail Cultural Resource Group

President

Dr. Barile has over 20 years of professional experience in the fields of archaeology, architectural history, historic research, and cultural resource management (CRM). She has directed the excavation of a wide array of archaeological sites in Virginia, Delaware, Maryland, Texas, South Carolina, and North Carolina, among others, and has recorded and researched an abundance of historic buildings, structures, districts, and objects. She has written and contributed to over 250 CRM reports. In addition to CRM experience, Dr. Barile has taught university courses in historic preservation and preservation law, architectural history, and archaeology. She has also published numerous professional articles and papers on her studies, including articles in Historical Archaeology and several National Register of Historic Places nominations.

Education

University of Texas, Ph.D. in Anthropology & Architectural History, 2004
University of South Carolina, M.A.in Anthropology, 1999
University of South Carolina, Master’s Cert. in Museum Management, 1999
Mary Washington College, B.A. in Historic Preservation, 1994

Professional Experience

22 Years

Registration

Secretary of Interior Standards Qualified as Archaeologist, Architectural Historian, Historian
Register of Professional Archaeologists

Sample Project Experience

9th Street Bridge Architectural Study (City of Roanoke, Virginia). Intensive architectural survey of the historic bridge as stipulated in the Memorandum of Agreement for a bridge improvement plan

Berryville Water Line Survey (Clarke County, Virginia). Phase I architectural evaluation and Phases I and II archaeological investigations along 4 miles of the proposed line

Ellis-Bell Archaeological Site (Fredericksburg, Virginia). Investigative archaeological study and archival research of 1830s kiln site

Historic Counting House (Falmouth, Virginia). Intensive architectural survey, archival research, and production of Memorandum of Agreement prior to adaptive reuse project

Interstate 64 Peninsula Study (Richmond to Hampton, Virginia). Archaeological assessment of a 75-mile section of the I-64 corridor as part of a Draft Environmental Impact Statement

Route 301 Construction (New Castle County, Delaware). Cultural resource studies including Phases I, II, and III archaeological studies based on a predictive model, as well as public outreach, and project coordination on behalf of the Delaware Department of Transportation

Wildwood Phase II Archaeological Testing (Loudoun County, Virginia). Archival research and archaeological testing of a nineteenth century domestic site

Emily Calhoun, M.A., RPA

Dovetail Cultural Resource Group

Report Manager

Ms. Calhoun has over 12 years of professional experience in the field of archaeology and has had the opportunity to work in a wide range of geographic and archaeological settings at sites in Colorado, Delaware, Maryland, Massachusetts, Nebraska, North Carolina, South Dakota, Virginia, Wisconsin, and Wyoming. As Dovetail's Report Manager, Ms. Calhoun is responsible for coordinating reporting tasks and assuring that reports and other written media meet internal and external quality standards.

Education

Colorado State University, M.A. in Anthropology, 2010
Virginia Polytechnic Institute and State University, B.S. in Biological Sciences, 2006

Professional Experience

12 Years

Registration

Secretary of Interior Standards Qualified as Archaeologist
Register of Professional Archaeologists

Sample Project Experience

Southeast High Speed Rail Corridor Study (Raleigh, North Carolina, to Washington D.C.). Archaeological Phase I survey, GIS mapping and modeling, and Phase II testing.
Archaeological Survey of Proposed Forest Thinning Parcels, Fort Pickett Military Training Center (Dinwiddie and Nottoway Counties, Virginia). Phase I archaeological survey of 190 acres on behalf of the Virginia Department of Military Affairs.
Mosby's Crossing Development Project (Warrenton, Virginia). Phase I cultural resource survey of approximately 46 acres for a proposed residential development.
Fauquier County Predictive Model (Fauquier County, Virginia). Prehistoric archaeological predictive model for archaeological sites in the county to aid in preservation development planning by the county.
Centerville Turnpike Road Widening (Virginia Beach, Virginia). Phase I archaeological survey of 12 acres associated with proposed road widening, on behalf of the City of Virginia Beach and Virginia Department of Transportation.
Historic Cemetery Delineation, Route 630 Project (Stafford County, Virginia). Cemetery delineation resulting in the identification of three marked and two unmarked graves within a nineteenth and twentieth century family cemetery, completed on behalf of the Virginia Department of Transportation.
Evaluation of the Chamber's Mill Dam (Buckingham County, Virginia). Phase II archaeological evaluation, on behalf of the Virginia Department of Transportation, of an eighteenth-century dam and mill site on the Slate River.
Archaeological Monitoring of the Solitude Water Line (City of Blacksburg, Virginia)**.** Archaeological monitoring of waterline installation at the mid-to-late nineteenth century Historic Solitude Property.

Kevin C. McCloskey

Dovetail Cultural Resource Group

Crew Chief

Mr. McCloskey has seven years of professional experience in the field of archaeology as it relates to cultural resource management. He has had the opportunity to work in a wide range of geographic and archaeological settings at archaeological sites in Virginia, North Carolina, Maryland, Florida, West Virginia, and The District of Columbia. At Dovetail, Mr. McCloskey is responsible for participating in all phases of archaeological field investigations.

Education

Sample Project Experience

Houston-LeCompt Archaeological Site (New Castle County, Delaware). Phase III archaeological data recovery of a late-eighteenth century through early-nineteenth century tenant farmstead to mitigate adverse effects to the site from construction of Route 301.

Armstrong Rogers Archaeological Site (New Castle County, Delaware). Phase III archaeological data recovery at a late-eighteenth through mid-nineteenth century farmstead work yard for Delaware Department of Transportation's U.S. Route 301 project.

Courthouse Road/ Route 1 Widening Project (Stafford County, Virginia). Phase I cultural resource survey, archival research, and reporting for the Courthouse Road/Route 1 Widening Project.

Virginia Beach Transit Extension Study Project (City of Virginia Beach, Virginia). Phase I cultural resource survey for the Hampton Transit Project.

Southeast High Speed Rail (DC2RVA Rail) Project (Richmond to Washington, D.C.). Cultural Resource studies, archival research, GIS field data collection, cultural resource GIS layers, and reporting.

Purple Line Light Rail (Montgomery and Prince Georges County, Maryland). Phase 1A reconnaissance studies, archival research, architectural analysis, Determinations of Eligibility, Phase 1B archaeological surveys, GIS field data collection, cultural resource GIS layers, coordination geomorphological studies, and reporting.

Eastern Shore Natural Gas Company White Oak Lateral Project (Kent County, Delaware). Cultural resource studies to Section 106 (National Historic Preservation Act) and National Environmental Policy Act compliance standards, under the regulatory authority of the Federal Energy Regulatory Commission.

Route 301 Northern Spur (New Castle County, Delaware). Phase II archaeological investigations on behalf of Delaware Department of Transportation.

ABSTRACT

Dovetail Cultural Resource Group (Dovetail), as part of the DC2RVA Project Team, and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted a reconnaissance-level architectural survey of the Preferred Alternative of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) project (the Project). The Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

From 2014 through 2017, the DC2RVA team conducted architectural reconnaissance studies on all Project alternatives inclusive of the areas within 500 feet of the centerline of each alternative corridor (also defined as the area of potential effects [APE]), resulting in the recordation of thousands of architectural resources. Since these studies, engineering associated with the development of the Project alternatives has resulted in a slightly expanded limit of disturbance (LOD) to accommodate road modifications, straightening curves, proposed station locations, parking areas, etc. The expanded LOD areas were not included in the original architectural study.

This report details buildings, objects, structures, and districts over 48 years of age within the LOD expansion APE (the date was designed to correspond to the schedule of the environmental document). In total, the DC2RVA Project Team surveyed 352 historic architectural resources—124 previously recorded and 228 newly recorded properties. Two resources were previously listed in the National Register of Historic Places (NRHP), and it is recommended that both remain listed: Rippon Lodge (076-0023) and the Town of Barton Heights Historic District (127-0816). Another 11 properties are recommended potentially eligible for the NRHP based on the current survey: East Rosemont Historic District (100-5341), Chancellor House (111-0013/111-0132-0508), Hackley-Monroe House/James Monroe House/Joseph Jones House (111-0038/111-0132-0509), Dr. Charles Mortimer House at 213 Caroline Street (111-0067/111-0132-0505), the 1770 House (111-0132-0126), Shiloh Baptist Church (New Site) (111-0132-0147), Robert Adams Residence (111-0132-0458), Loving's Produce Company (127-0344-0102), Philip Morris Operations Complex (127-5818), Gilpin Court Apartment Complex (127-6883), and Hanover County School Board (166-5073-0024). One resource, Hoopers (042-0556), was not accessible during the current survey; it is recommended that further study be completed to determine eligibility.

The remaining 338 resources are recommended not individually eligible for the NRHP, although 126 of these properties are recommended to be contributing elements to surrounding historic districts: Rosemont Historic District (100-0137), East Rosemont Historic District (100-5341), Boundary Markers of the Original District of Columbia (000-0022), Fredericksburg Historic District (111-0132), Berkleytown Historic District (166-5073), Laurel Industrial School Historic District (043-0292), Town of Barton Heights Historic District (127-0816), Seaboard Air Line Railroad Corridor (127-5271), and Richmond, Fredericksburg & Potomac Railroad (500-0001).

1 INTRODUCTION

Dovetail Cultural Resource Group (Dovetail), as part of the DC2RVA Project Team, and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted a reconnaissance-level architectural survey of additional segments within the Preferred Alternative of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) project. The project is being completed as Virginia Department of Historic Resources (DHR) File #2014-0666.

The Federal Railroad Administration (FRA) and DRPT propose passenger rail service and rail infrastructure improvements in the north-south travel corridor between Washington, D.C. and Richmond, VA. These passenger rail service and rail infrastructure improvements are collectively known as the DC2RVA project. The Project will deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. The Project is part of the larger Southeast High Speed Rail (SEHSR) corridor (Figure 1-1), which extends from Washington, D.C. through Richmond, VA, and from Richmond continues east to Hampton Roads (Norfolk), VA, and south to Raleigh, NC, and Charlotte, NC, and then continues west to Atlanta and south to Florida. The Project connects to the National Railroad Passenger Corporation (Amtrak) Northeast Corridor (NEC) at Union Station in Washington, D.C.

The purpose of the SEHSR program, as stated in the 2002 Tier I Final Environmental Impact Statement (EIS) completed for the full SEHSR corridor, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte, NC, travel corridor. The purpose of the current Washington, D.C. to Richmond SEHSR project described here is to fulfill the purpose of the SEHSR Tier I EIS within this segment of the larger SEHSR corridor. The Project, by increasing rail capacity and improving travel times between Washington, D.C. and Richmond, will improve passenger train performance and reliability in the corridor, enabling intercity passenger rail to be a competitive transportation choice for travelers between Washington, D.C., Richmond, and beyond.

Given FRA’s funding involvement and permitting through various other federal agencies, the DC2RVA project is required to comply with Section 106 of the National Historic Preservation Act of 1966, as amended, and its implementing regulations under 36CFR800. Additionally, all cultural resource work was designed to comply with the Virginia Antiquities Act (Code of Virginia § 10.1-2300) and guidelines and regulations promulgated by the DHR, as necessary.

1.1 PROJECT LOCATION

The DC2RVA Team outlined the Build Alternatives, including the Preferred Alternative, for this project in the Draft Environmental Impact Statement (DEIS), which was signed by the FRA in September 2017. The Preferred Alternative was approved by the Commonwealth Transportation Board in December 2017 and spans 123 miles along an existing rail corridor owned by CSX Transportation (CSXT) between Control Point RO (milepost [MP] CFP 110) in Arlington, VA, to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County) (Figure 1-2). At the northern terminus in Arlington, VA, the Project limit ends at the southern approach to Long Bridge, a double-track rail bridge taking the rail corridor over the Potomac River; however, the northern terminus of Union Station in Washington, D.C. will be used for ridership and revenue forecasting, as well as service development planning within the Project corridor. The southern terminus in Centralia is the junction of two CSXT routes that begin in Richmond and rejoin approximately 11 miles south of the city.

Proposed improvements are along CSXT-owned track, generally parallel to the I-95 corridor between northern Virginia and Richmond. From north to south, the project travels through the following counties and cities:

- Arlington County
- City of Alexandria
- Fairfax County
- Prince William County
- Stafford County
- City of Fredericksburg
- Spotsylvania County
- Caroline County
- Hanover County
- Henrico County
- City of Richmond
- Chesterfield County

In Arlington, the Project connects to existing CSXT track extending across the Potomac River on the Long Bridge into Washington, D.C. and Union Station, the southern terminus of Amtrak's Northeast Corridor (NEC). At Centralia, the Project connects to both the Richmond to Raleigh segment of the SEHSR corridor and the Richmond to Hampton Roads segment of the SEHSR corridor.

Overview of the DC2RVA Project Corridor

\\cltsmain\GIS_DATA\GIS\Projects\011545_VADeptofRails-PublicTransportation\0239056_RAPS-4AltDev-ConceptEng\map_docs\mxd\Dovetail Figures\Fig1-2_DC2RVAProjectCorridor_8.5x11.mxd | Last Updated: 06.10.2015

The Washington, D.C. to Richmond segment is an integral part of the overall Washington, D.C. to Charlotte SEHSR corridor and provides a critical link between high speed intercity passenger service from Boston to Washington, D.C. and the southeastern United States.

1.2 PROJECT DESCRIPTION

The DC2RVA project will include specific rail infrastructure improvements, proposed road construction, and service upgrades intended to improve the travel time, service frequency, and on-time performance of passenger trains operating between Washington, D.C. and Richmond, VA. Specific improvements to the existing rail infrastructure between Arlington, VA, and Centralia, VA, include:

- Corridor-wide upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and grade crossing improvements.
- Corridor-wide improvements to train operating capacity to achieve higher passenger train service frequency and reliability, including an additional main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other capacity and reliability improvements at certain locations.
- Station and platform improvements for Amtrak and Virginia Railway Express (VRE) stations.

The Tier II EIS being completed for the Project will assess the environmental impacts of these improvements and identify ways to avoid, minimize, or otherwise mitigate such impacts. The Project may include locations for new or replacement intercity passenger stations on the Project corridor, and additional rail capacity and other improvements in the Richmond area, including on the CSXT Peninsula Subdivision from AM Junction in Richmond, VA (just north of Main Street Station), east to Beulah Road in Henrico County, and on the bypass areas around the Town of Ashland, VA, and the City of Fredericksburg, VA.

Studies in support of the Project will address passenger and freight rail operations and service between Union Station in Washington, D.C. to Richmond and beyond, but the Project does not include physical improvements to the Long Bridge across the Potomac River or to rail infrastructure within Washington, D.C. Other projects will address improvements to the rail infrastructure north of Arlington and south of Centralia along the SEHSR corridor.

The original architectural reconnaissance study for the DC2RVA project was conducted between 2014 and 2016. This work included recordation of buildings, structures, objects and districts over 48 years in age within all alternatives under consideration (the date was determined to correspond to the schedule for environmental documentation). The area of potential effects (APE) for this work included a 500-foot study corridor from the centerline of each alternative. The APE was expanded to 1,000 feet in areas where an overpass would be constructed as part of the project and was redefined as one city block in urban sectors. As project designs have been refined, the Project limits of disturbance (LOD) have been modified to accommodate various design needs. These include road modifications, straightening curves, the addition of wyes, proposed station locations, parking areas, etc. These expanded LOD areas were not included in the original architectural reconnaissance study. As such, this addendum report includes all areas that are now within the project APE but which were not included in previous investigations.

1.3 PREVIOUS SURVEYS AND CURRENT STUDY

The DC2RVA Team has been conducting reconnaissance-level architectural studies for the entire 123-mile DC2RVA corridor since December 2014. To date, the findings have been detailed in 16 reports. The current study included a reconnaissance architectural survey of LOD expansion areas within the Preferred Alternative of the DC2RVA corridor in any part of the APE that was not included in a previous document. Historic Context and Background Review sections for the overall project corridor are not included, as this information was presented in previous DC2RVA project reports (e.g., Anderson and Staton 2016; Manning et al. 2016; Manning and Salvato 2016; Peckler 2016; Staton et al. 2016a; Staton et al. 2016b; Staton and Lesiuk 2015; Sylvester and Staton 2016). The results of the archaeological survey spanning the entire 123-mile corridor are discussed in separate documents.

The current architectural survey was conducted to evaluate previously recorded properties that have not been evaluated for the NRHP as well as any unrecorded resource over 48 years in age. Any property in the APE that has been previously determined to be eligible, or is listed in, the NRHP, was briefly reviewed to assure that the characteristics that rendered the property eligible are still intact. For the purposes of the current study, the APE is defined as the footprint of proposed construction work associated with the Project plus any areas where alterations to a resource's setting and feeling are likely to occur as a result of it. For areas where the Project LOD has been expanded beyond the original study corridor, the APE includes the footprint and an additional 500-foot buffer on either side for new roads, stations, or track modifications, and the footprint plus a 1,000-foot buffer on either side for new overpasses.

2 METHODOLOGY

The architectural survey was conducted to evaluate any historic buildings, objects, or districts over 48 years in age for NRHP eligibility. Each resource was evaluated in regards to Criterion A, for its association with events that have made a significant contribution to the broad patterns of our history; Criterion B, for its association with people significant in our nation's history; and Criterion C, for its embodiment of distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or possess high artistic values. As part of the current survey, these architectural resources were not evaluated under Criterion D for its potential to yield information important in history. Criteria considerations were taken into account only where necessary. In addition, all resources were viewed in light of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

For previously recorded resources determined eligible for, or listed in, the NRHP within the APE, the DC2RVA team briefly examined these properties to assure that they retain the characteristics that rendered them eligible for the NRHP, but in-depth studies were not completed on these resources.

During the architectural survey of both newly recorded and previously identified resources, the Project APE was surveyed through a combination of a vehicular and pedestrian reconnaissance. Above-ground properties meeting the established age criteria were documented through photographs, written notes, and mapping. This includes buildings, structures, objects, and districts within the Project APE. Digital photos were taken of each property documenting the primary elevation, oblique angles, and general setting.

After the architectural fieldwork was completed, the project team prepared separate Virginia Cultural Resources Information System (V-CRIS) forms and accompanying documentation for each recorded property in accordance with DHR policies and practices. Each V-CRIS packet includes a V-CRIS form, site plan, set of hard-copy color photographs, and a CD of digital photos for each property. The hard copy and electronic versions of the photographs were labeled and prepared according to DHR standards.

3 RESULTS

The architectural investigation of the expanded LOD of the DC2RVA project involved a field survey of any areas that are now in the LOD and Project APE that were not included in previous studies. In total, the team recorded 352 resources, 124 of which were previously recorded with the DHR and 228 were newly recorded as a part of this effort.

3.1 PREVIOUSLY RECORDED RESOURCES

This survey identified 124 previously recorded buildings, structures, objects, and districts within the APE (Table 3-1, Figures 3-1 through 3-16). Two of these resources were previously listed in the NRHP and Virginia Landmarks Registry (VLR), 14 were determined not eligible for listing in the NRHP by the DHR, and the remaining 108 had not been formally evaluated for NRHP eligibility.

There were two previously NRHP/VLR listed resources revisited as part of this project. Rippon Lodge/Blackburn House (076-0023) is located at 15500 Blackburn Road in Woodbridge (Figure 3-17). Although the resource is located outside of the 500-foot APE, it was determined that the resource is visible from the rail crossing at Neabsco Creek to the east (Figure 3-18). As such, the architectural APE was expanded to include this viewshed. Rippon Lodge was listed in the VLR and NRHP in 1971 under Criterion A for its association with the early development of the area and Criterion B for its association with Thomas Blackburn. This resource was revisited during the current study to ascertain if the characteristics that rendered it previously eligible for the NRHP are in place. Based on the current reconnaissance survey, it is **recommended that this resource retain its status as a listed property in the VLR and NRHP**.

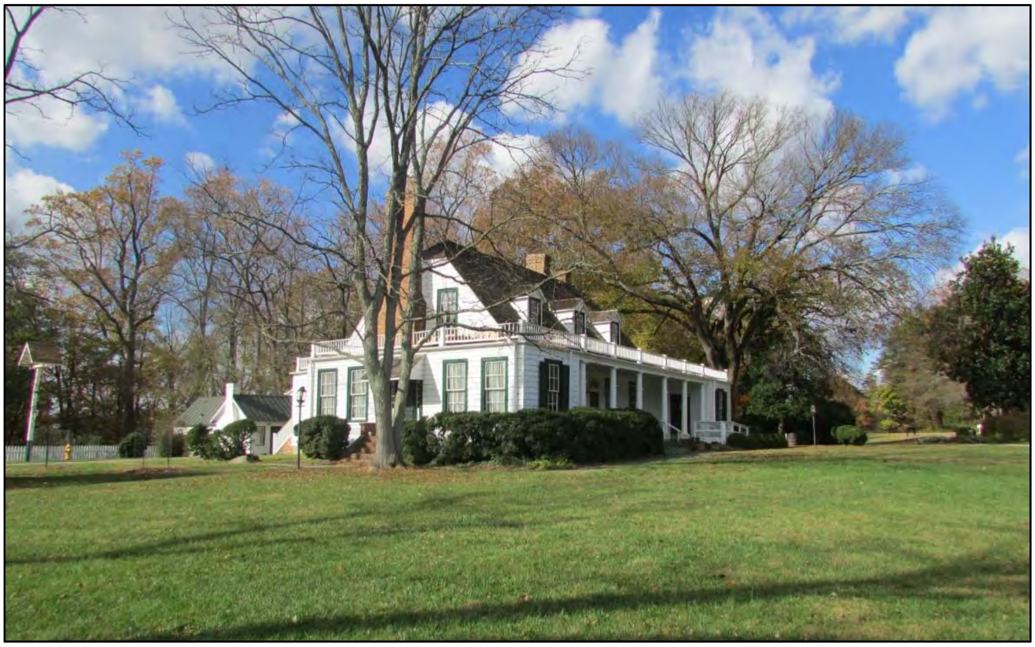

FIGURE 3-17: RIPPON LODGE (076-0023), EAST OBLIQUE

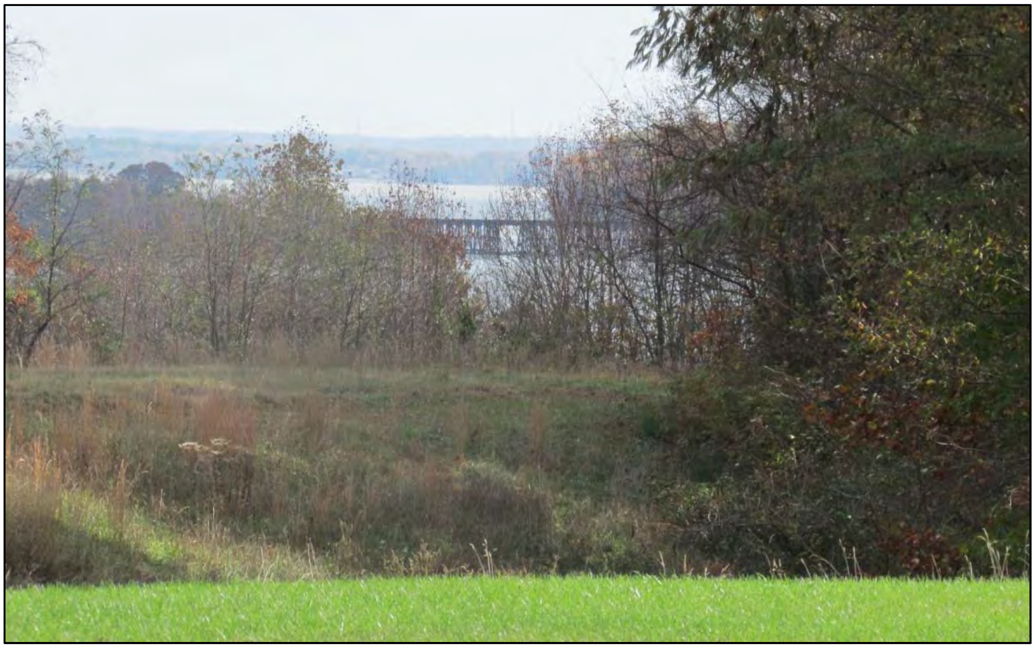

FIGURE 3-18: VIEW FROM RIPPON LODGE TO NEABSCO CREEK RAIL BRIDGE, LOOKING SOUTHEAST

The Town of Barton Heights Historic District (127-0816) was listed in the NRHP in 2003 and the VLR in 2011 under Criterion A for its association with important events in Transportation and Community Planning and Development and Criterion C for its distinctive architecture. This turn-of-the-century, streetcar neighborhood is located in the northern section of the City of Richmond and filled with single- and multi-family dwellings constructed in the Queen Anne or Colonial Revival styles and are similar in scale, materials, massing and setbacks (Figure 3-19). The resource, revisited during the current survey due to its determination being made over five years, is **recommended to retain its status as NRHP and VLR listed.**

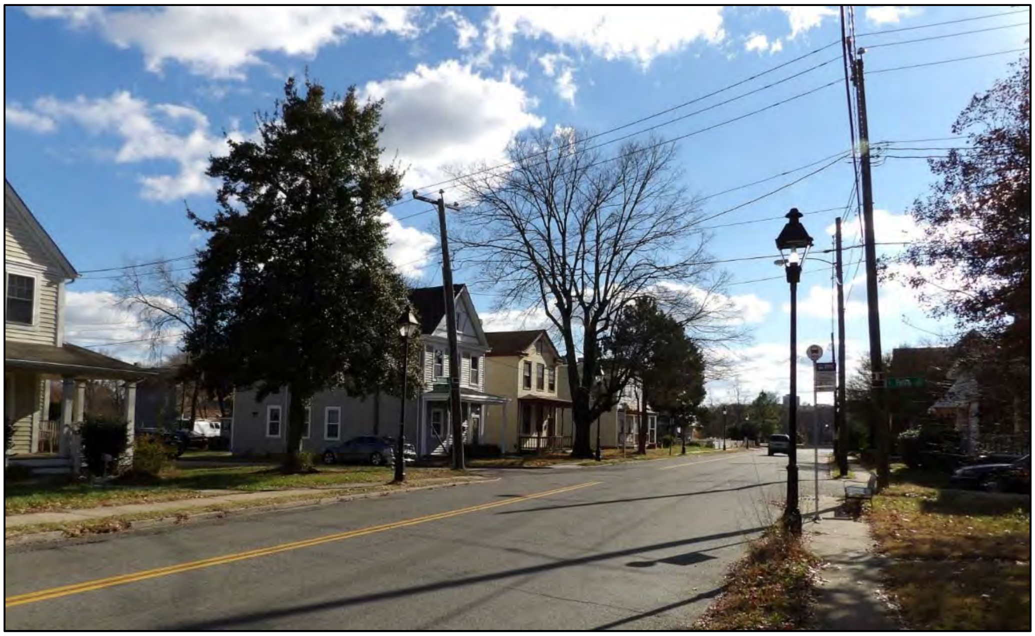

FIGURE 3-19: TOWN OF BARTON HEIGHTS HISTORIC DISTRICT (127-0816), LOOKING SOUTH ALONG MONTEIRO STREET

Eight of the 108 previously recorded resources that had not received an eligibility determination are recommended potentially eligible for the VLR/NRHP as a result of this reconnaissance study. Five are in Fredericksburg and three are in Richmond.

The Chancellor House (111-0132-0508) in Fredericksburg is a two-story, four-bay, single-family dwelling built circa 1780 in a Georgian style (Figure 3-20). It is in good condition and has retained its overall character and integrity. For these reasons, it was recommended as potentially eligible for the NRHP under Criterion C in a 2007 survey. The resource has not changed significantly since that assessment, therefore, **it is recommended that the house remain potentially eligible under that criterion. Based on the current evaluation, it is also recommended that the resource is potentially eligible under Criteria A and B.** This property was owned by George Aler during the second quarter of the nineteenth century, Fredericksburg's most prominent slave dealer. Contemporary accounts describe an associated slave pen immediately north of the dwelling (Barile et al. 2018:3-69–3-83). This resource therefore may have a notable connection to the slave trade in Fredericksburg (Criterion A) and an association with George Aler (Criterion B) with significance at the local level. As an architectural resource, it was not evaluated under Criterion D. The house has been previously identified as a **contributing element of the Fredericksburg Historic District (111-0132)**. As it continues to reflect the history of this area and retains a high level of historic integrity, it is recommended to remain a contributing resource within this district.

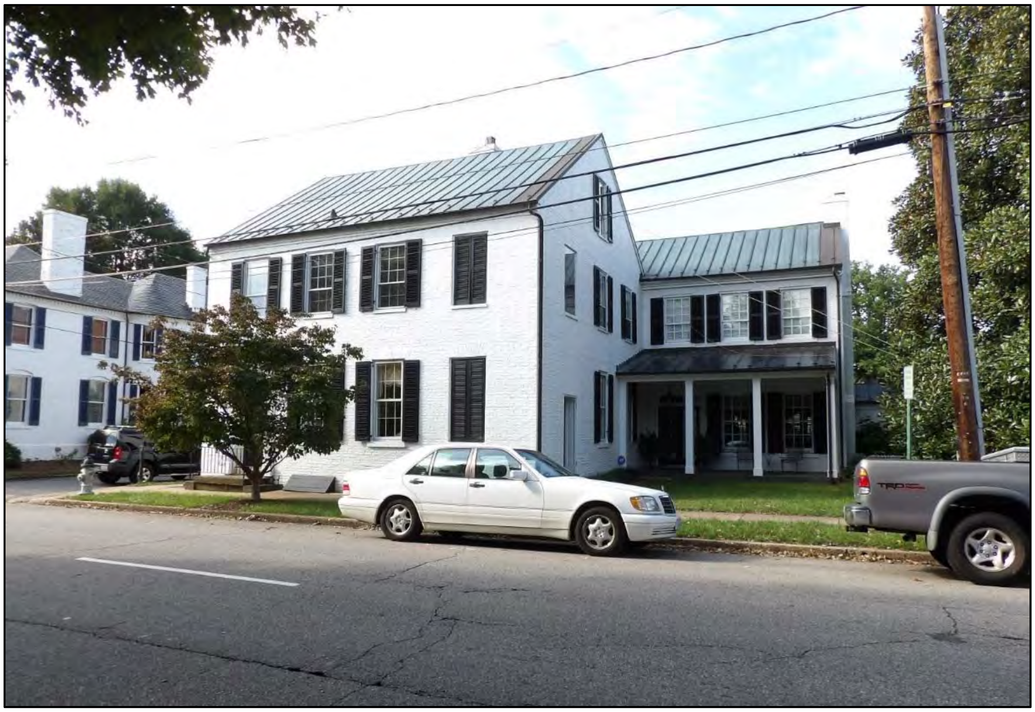

FIGURE 3-20: CHANCELLOR HOUSE AT 300 CAROLINE STREET (111-0132-0508), NORTH OBLIQUE. THE FORMER SLAVE PEN WAS LOCATED IN FRONT OF THE REAR ADDITION.

The Hackley-Monroe House, also known as the James Monroe House and the Joseph Jones House (111-0038/111-0132-0509), is situated in the southern end of the Fredericksburg Historic District. It is a two-and-one-half-story, late-Georgian-style, parged, single-family dwelling constructed around 1785 (Figure 3-21). Although the resource features some common modifications such as additions, it still retains enough historic integrity to merit eligibility for the NRHP. The house was also occupied by President James Monroe for a short time in the late-1780s. The DC2RVA Team **recommends the Hackley-Monroe House as potentially individually eligible for the NRHP under Criterion C as an outstanding example of this period and style of architecture at the local level.** It is also **recommended to remain a contributing resource within the Fredericksburg Historic District (111-0132).**

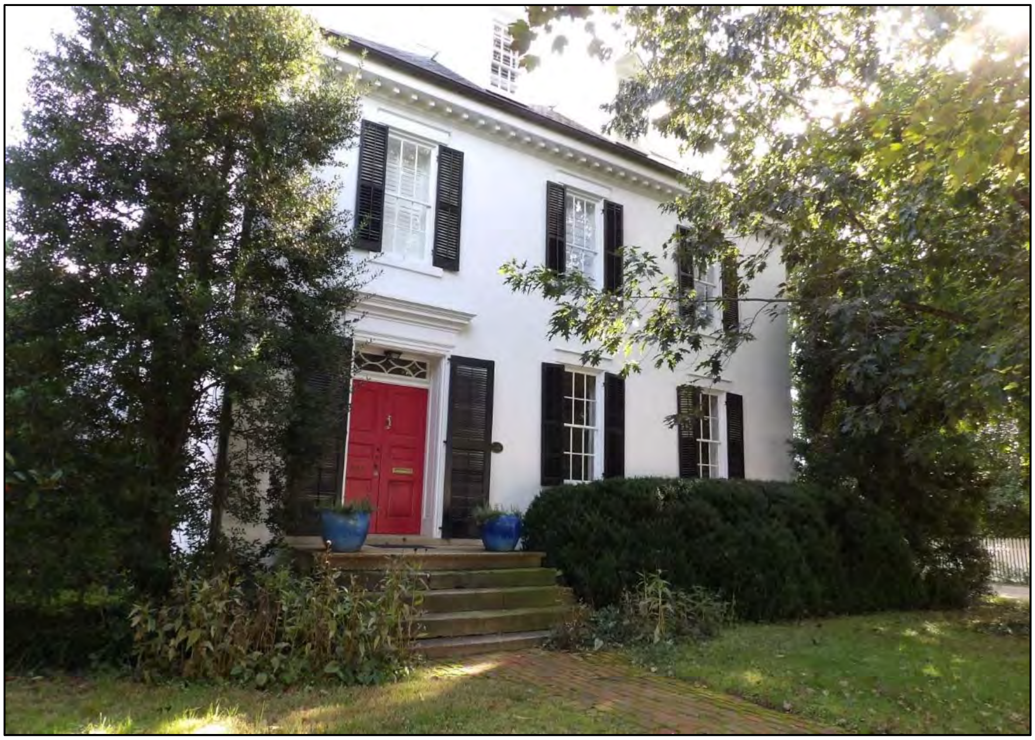

FIGURE 3-21: HACKLEY-MONROE HOUSE (111-0038/111-0132-0509), SOUTHWEST ELEVATION

The Dr. Charles Mortimer House (111-0067/111-0132-0505) at 213 Caroline Street in Fredericksburg is a two-story, Federal-style, single-family dwelling constructed in Flemish-bond brick between 1764 and 1780 (Figure 3-22). The building contains a mixture of late Georgian- and early Federal-style elements include modillions in the roof eaves as well as a porch with a full entablature and Ionic columns. The house is associated with Dr. Charles Mortimer, one of Fredericksburg's early prominent citizens. He was a local physician as well as the City's first mayor. The DC2RVA Team **recommends the Dr. Charles Mortimer House as potentially individually eligible for the NRHP under Criterion B for its association with Dr. Charles Mortimer and Criterion C as an outstanding example of this period and style of architecture at the local level.** It is also **recommended to remain a contributing resource within the Fredericksburg Historic District (111-0132).**

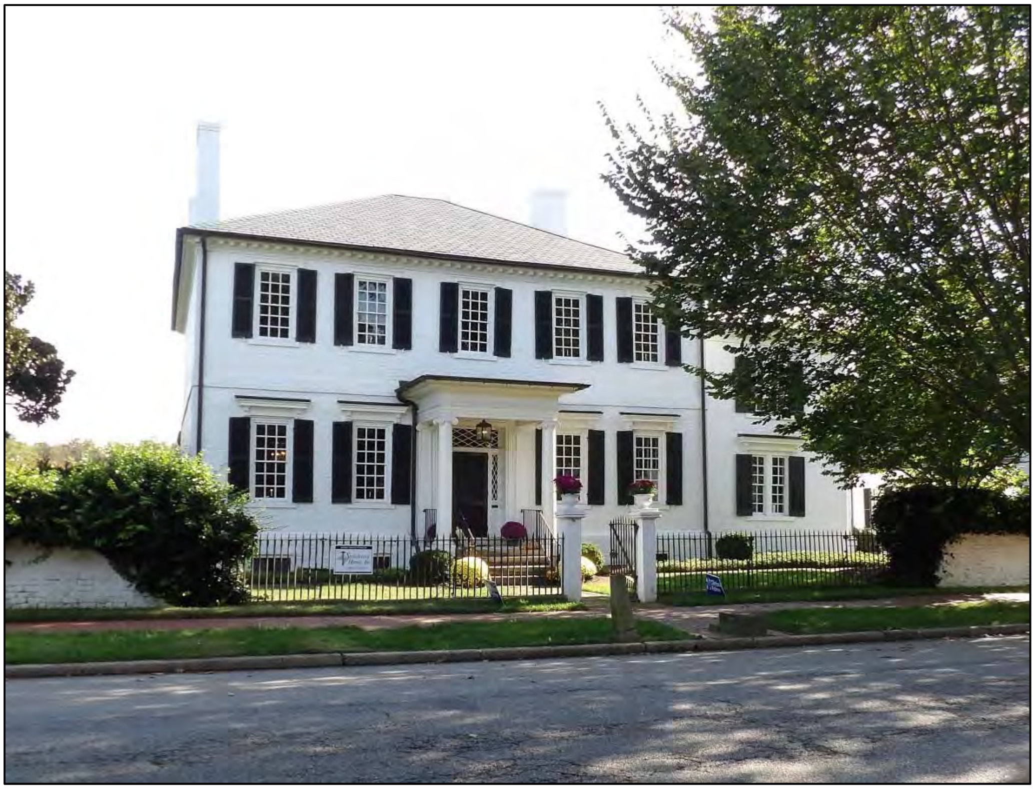

FIGURE 3-22: DR. CHARLES MORTIMER HOUSE (111-0067/111-0132-0505), SOUTHWEST ELEVATION

The 1770 House (111-0132-0126), located in the southern end of the Fredericksburg Historic District, is a one-and-one-half-story, wood-frame, weatherboard-clad dwelling constructed circa 1770 in the Tidewater tradition with some Georgian-style elements (Figure 3-23). The building features a wood-shingled, gabled roof pierced by gabled dormers and wood-frame windows. When it was last surveyed in 2006, the resource was recommended to be eligible for the NRHP under Criterion C due to its good condition and the retention of its historic fabric. The building has been well maintained and retains a high level of historic integrity, despite large additions to the rear because they were constructed in similar form and massing. As the building has not notably changed since it was last surveyed, it is **recommended that the resource remains potentially eligible under Criterion C**. It has no known association with any events or individuals of historical significance and is, therefore, recommended not eligible for the NRHP under Criteria A and B. The house has been previously identified as a contributing element of the Fredericksburg Historic District (111-0132). As it continues to reflect the history of this area and retains a high level of historic integrity, it is **recommended to remain a contributing resource within this district.**

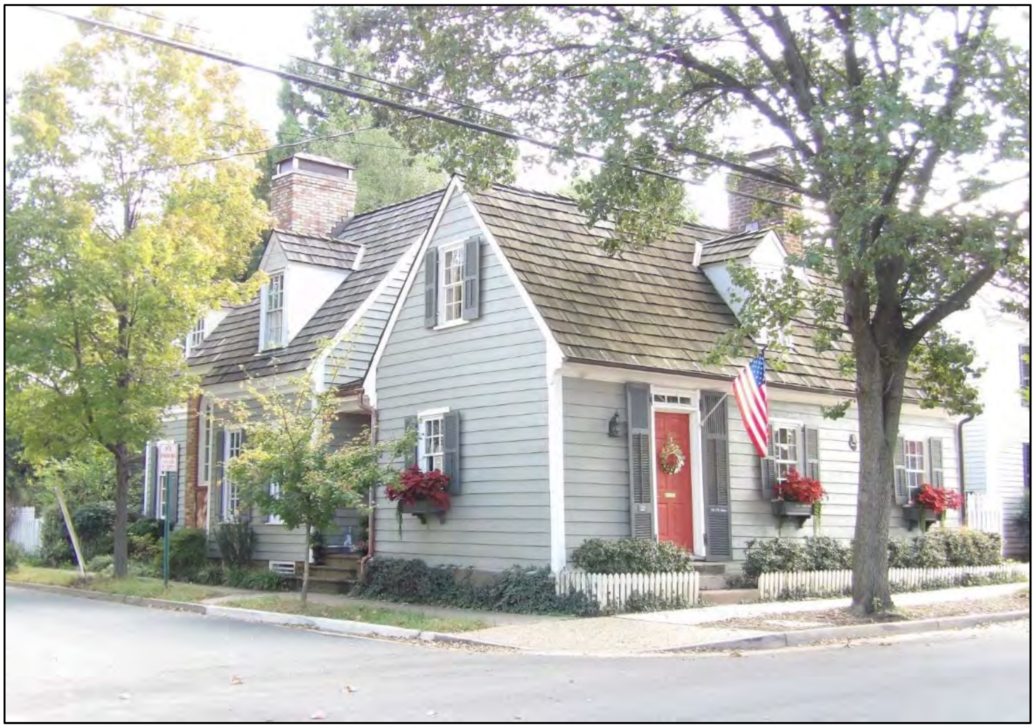

FIGURE 3-23: THE 1770 HOUSE (111-0132-0126), NORTHWEST OBLIQUE

The Robert Adams Residence (111-0132-0458) in Fredericksburg, constructed circa 1891, is a two-story, Italianate-style dwelling covered by a hipped roof accented by a molded cornice featuring scrolled modillions and dentils (Figure 3-24). A prominent two-story, bay window embellished by a projecting cornice encompasses half of the primary elevation. The resource, which is located in the heart of the city on one of its main thoroughfares of Caroline Street, is an excellent representation of the Italianate style and has experienced limited alterations. The DC2RVA Team **recommends the Robert Adams Residence (111-0132-0458) as potentially individually eligible for the NRHP under Criterion C as an outstanding example of this period and style of architecture at the local level.** It is also **recommended to remain a contributing resource within the Fredericksburg Historic District (111-0132).**

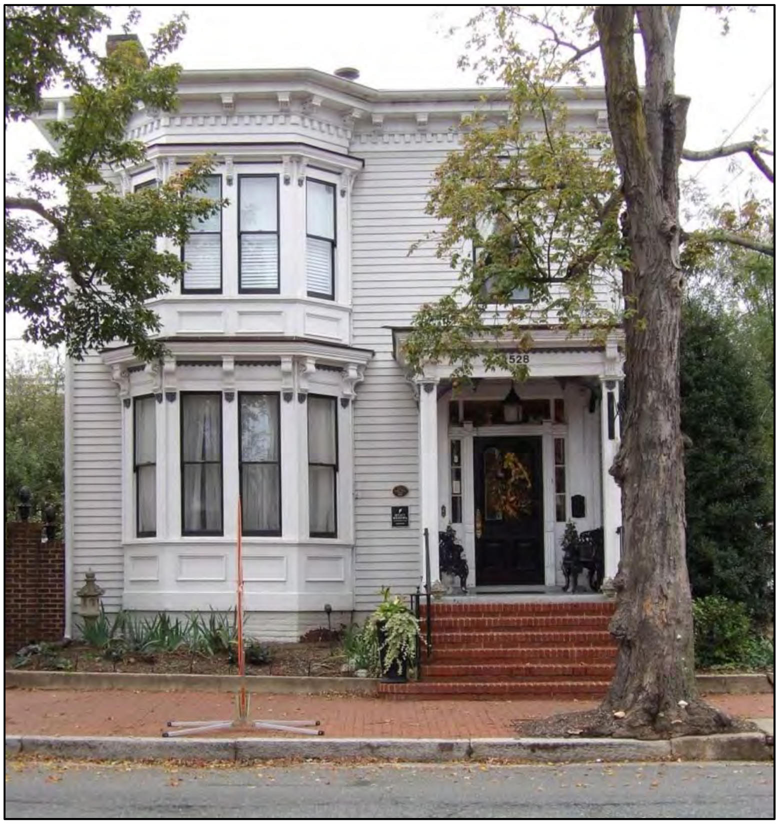

FIGURE 3-24: ROBERT ADAMS RESIDENCE (111-0132-0458), NORTHEAST ELEVATION

The Gilpin Court Apartment Complex (127-6883) in Richmond is an approximately 15-acre apartment complex built in 1942 by the Richmond Redevelopment and Housing Authority (RRHA) as subsidized, public housing (Figure 3-25). The RRHA, which was created by the Richmond City Council in 1940, "grew out of a national program launched by the federal government in the late 1930s to combat blight and to provide housing for many of the poor suffering from the Great Depression" (RRHA 2017). Although the City of Richmond has many of these "courts," Gilpin Court is the oldest of them and was allegedly named for "Charles Sydney Gilpin, an African-American resident of Jackson Ward who became one of the country's most significant stage actors of the 1920s" (Holmberg 2017). Given the resource's association with Richmond's African-American community, with the national subsidized housing movement from the Public Works Administration, and its role in the City's overall city planning and social history, **it is recommended that the resource is potentially eligible for listing in the NRHP under Criterion A**. The complex has not been properly maintained and suffers from a loss of integrity as well as a constant threat of demolition. Therefore, it is recommended that the resource is not eligible for listing in the NRHP under Criterion C. Although the complex is named for a popular Richmond-native, African-American actor, there is no clear association to that person. It is not known that the complex is associated with any other significant person form our history; and for these reasons, the resource it recommended that the resource is not eligible for the NRHP under Criterion B.

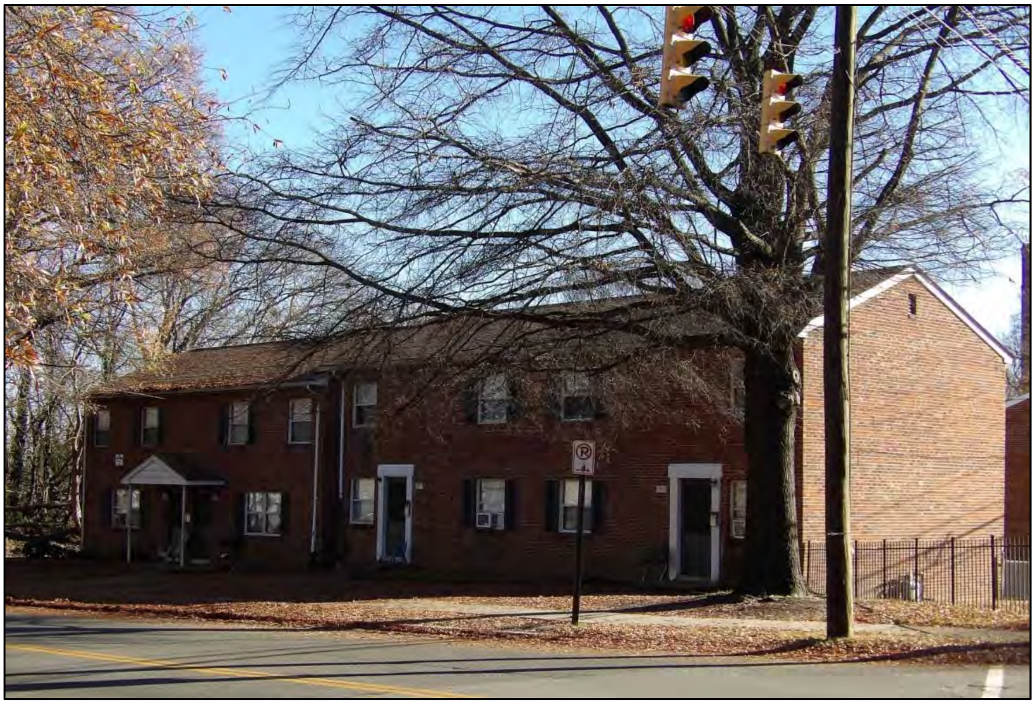

FIGURE 3-25: GILPIN COURT APARTMENT COMPLEX (127-6883), LOOKING EAST FROM N. 1ST STREET AT ONE OF THE ORIGINAL APARTMENT BUILDINGS

The commercial building at 1601–1605 E. Grace Street in Richmond, locally known as Loving's Produce Co. (127-0344-0102), is a three-story, eight-bay, commercial building constructed around 1870 with vernacular Italianate attributes (Figure 3-26). It was built during a period of tremendous regrowth in Richmond, when the industrial and commercial core of what is today the Shockoe Valley and Tobacco Row Historic District (127-0344) was rebuilt after Civil War-era devastation. This resource is one of the earliest, and few surviving, examples of the immediate post-war reconstruction in this area. It represents the efforts by residents to reclaim their city by establishing new businesses and constructing warehouses to provide goods and employment to the area. For its notable associations with the rebuilding of Shockoe Bottom, this resource is **recommended potentially eligible under Criterion A at the local level.** While the Loving name has been present in this area for generations, the family does not appear to have attained significance in their own right, thus it is recommended not eligible under Criterion B. The building is currently vacant, exhibits signs of deterioration, and has been notably modified over the decades; as such it is recommended not eligible under Criterion C. Loving's Produce Co. is located within the NRHP-listed Shockoe Valley and Tobacco Row Historic District. It was built during the district's period of significance (ca. 1870–1950) and represents architectural trends throughout the community. The resource is **recommended to contribute to the eligibility of the Shockoe Valley and Tobacco Row Historic District**.

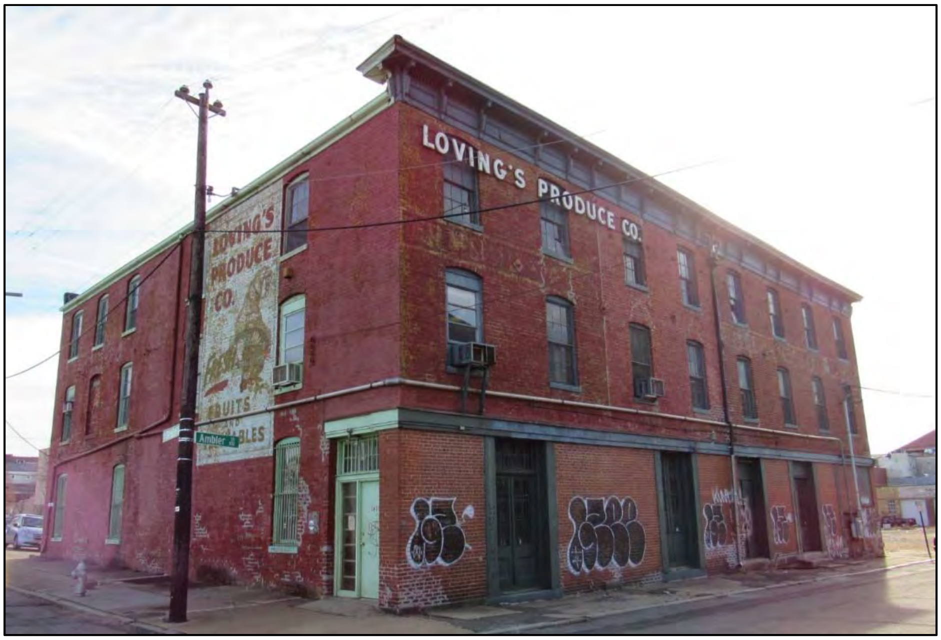

FIGURE 3-26: LOVING'S PRODUCE COMPANY (127-0344-0102), NORTH OBLIQUE

The Philip Morris Operations Complex (127-5818) in Richmond is an industrial complex used for tobacco processing constructed between 1950 and 1980. The complex comprises multiple warehouses, office buildings, industrial structures, and manufacturing equipment. Notably, several of the buildings on the property were designed by famed New York-based architect, Ulrich Franzen, some of which embody the International and Post-Modern architectural styles and were potentially constructed less than 50 years ago (Figure3-27). Initial research indicates that Franzen was a famed German-born American architect known for his Modernist-style architectural designs (Harvard University Library 2000). Therefore, it is recommended that the resource is potentially eligible under Criterion C for listing in the NRHP and Criterion Consideration G. The resource is not known to be associated with a significant event or person from our history, and as such, is recommended not eligible for the NRHP under Criteria A and B. In conclusion, the Philip Morris Operations Complex (127-5818) is **recommended as potentially eligible for the NRHP under Criterion C as an outstanding example of this period and style of architecture at the local level and Criterion Consideration G as a property that has achieved significance within the past 50 years.**

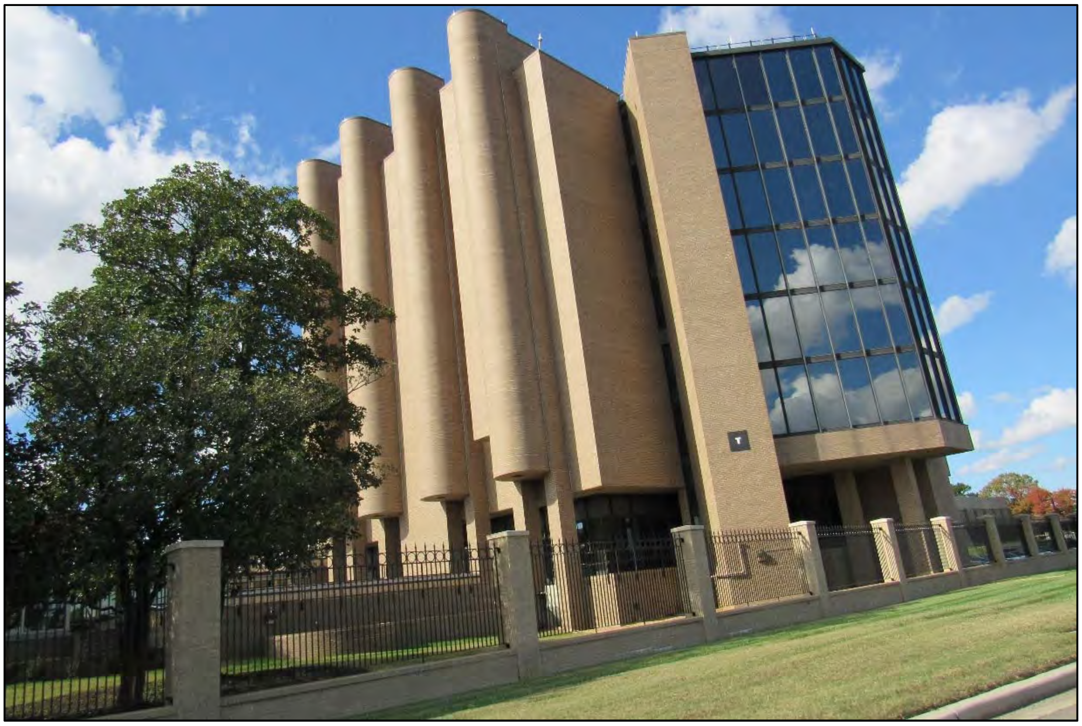

FIGURE 3-27: PHILIP MORRIS OPERATIONS COMPLEX (127-5818), MAIN BUILDING, SOUTHEAST OBLIQUE

The remaining 114 resources are recommended not eligible for the NRHP. The vast majority are twentieth-century residential buildings that represent post-war occupational booms of the D.C. to Richmond metro area; some ecclesiastic buildings, commercial structures, and industrial complexes can also be found among the collection. The oldest resource is the Dr. Charles Mortimer House at 216 Caroline Street in Fredericksburg (111-0132-0507), constructed in 1770; the latest-dating resource is the Double House in the Rosemont Historic District (100-0137-0272), built in 1985. Each of the resources was evaluated for its significance and integrity, and none exhibited notable merit to render a recommendation of individual eligibility.

More specifically, of the 114 resources, 13 were previously determined to be not eligible by the DHR but the determination occurred more than five years ago. As such, these resources were reevaluated to meet DHR requirements. It is **recommended that the following 13 resources remain not eligible: 076-5212, 076-5213, 076-5215, 127-6623, 127-6658, 127-6224, 127-6322, 127-6323, 127-6335, 127-6336, 127-6233, 127-6234, and 127-6235.**

Ten resources have been demolished since they were originally recorded. They were not evaluated for individual NRHP eligibility before they were removed. As they are no longer extant, it is **recommended that these resources are not eligible for the NRHP: 076-5214, 127-0816-0028, 127-0816-0029, 127-0835, 127-0836, 127-0837, 127-0838, 127-0839, 127-6138, and 127-0796.**

Sixty-seven additional resources not previously evaluated are recommended not eligible for individual NRHP listing, but are believed to contribute to a surrounding historic district. These resources include:

Not Eligible/Contributing to the Rosemont Historic District (100-0137) (n=17): 100-0137-0033, 100-0137-0030, 100-0137-0029, 100-0137-0274, 100-0137-0002, 100-0137-0004, 100-0137-0006, 100-0137-0008, 100-0137-0010, 100-0137-0273, 100-0137-0268, 100-0137-0265, 100-0137-0263, 100-0137-0261, 100-0137-0258, 100-0137-0227, and 100-0137-0270

Not Eligible/Contributing to the Boundary Markers of the Original District of Columbia (000-0022) (n=1): 000-0022-0003

Not Eligible/Contributing to the Fredericksburg Historic District (111-0132) (n=18): 111-0132-0131, 111-0132-0132, 111-0132-0454, 111-0132-0455, 111-0132-0457, 111-0132-0459, 111-0132-0460, 111-0132-0507, 111-0132-0524, 111-0132-0525, 111-0132-0526, 111-0132-0527, 111-0132-0528, 111-0132-0686, 111-0132-0687, 111-0132-0688, 111-0132-0689, and 111-0132-0690

Not Eligible/Contributing to the Laurel Industrial School Historic District (043-0292) (n=3): 043-0292-0002, 043-0292-0004, and 043-0292-0005

Not Eligible/Contributing to the Town of Barton Heights Historic District (127-0816) (n=27): 127-0816-0007, 127-0816-0017, 127-0816-0027, 127-0816-0030, 127-0816-0031, 127-0816-0065, 127-0816-0066, 127-0816-0067, 127-0816-0068, 127-0816-0069, 127-0816-0070, 127-0816-0071, 127-0816-0072, 127-0816-0073, 127-0816-0074, 127-0816-0087, 127-0816-0088, 127-0816-0089, 127-0816-0090, 127-0816-0091, 127-0816-0092, 127-0816-0001, 127-0816-0002, 127-0816-0003, 127-0816-0004, 127-0816-0005, and 127-0816-0006

Not Eligible/Contributes to the Seaboard Air Line Railroad Corridor (127-5271 (n=1): 020-5623

Twenty-three resources are **recommended as not individually eligible and not contributing to a historic district. They include: 020-5392, 020-5409, 043-0292-0003, 043-5467, 089-0166, 111-0132-0304, 111-0132-0426, 100-0137-0259, 100-0137-0267, 100-0137-0272, 100-0158, 127-0009, 127-0344-0291, 127-0816-0061, 127-0816-0062, 127-0816-0063, 127-0816-0064, 127-0816-0075, 127-0816-0076, 127-0816-0083, 127-0816-0084, 127-0816-0085, and 127-0816-0086.**

The final previously recorded property was not accessible during the current study. **Hoopers at (042-0556) 11108 McConnell Lane in Hanover County will be assumed potentially eligible** for the purposes of the current review and the subject of additional study once access is granted to ascertain its significance and integrity and render a recommendation on NRHP eligibility.

3.2 NEWLY RECORDED RESOURCES

Of the 352 resources documented during the current effort, 228 have not yet been recorded with the DHR (Table 3-2; Figures 3-28 through 3-51). Each of these newly recorded resources was evaluated for its potential to be individually eligible for the NRHP and potential contribution to surrounding historic districts, as applicable.

TABLE 3-2: NEWLY RECORDED RESOURCES IDENTIFIED DURING THIS SURVEY (RESOURCES LISTED NORTH TO SOUTH)

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
000-9818	DC Warehouse MA-134, off of Airport Access Road and Mt. Vernon Parkway	Arlington County	ca. 1964	Not Eligible

Figure 3-51
Newly Recorded Resources
(Map 24 of 24)

4/2018

Three newly recorded resources are recommended to be individually potentially eligible for the NRHP: one is in Alexandria, one is in Fredericksburg, and one is in Ashland.

The East Rosemont Historic District (100-5341) in Alexandria comprises a later section of the Rosemont neighborhood (100-0137), an NRHP-listed, early-twentieth-century planned residential subdivision northwest of the Old and Historic District of Alexandria. The East Rosemont District includes a 30-acre area of working-class, single-family and multi-family dwellings constructed mostly between 1915 and 1955, composed of modest vernacular buildings aimed at the local railroad and industrial workers (Figure 3-52). The district is **recommended potentially eligible for the NRHP under Criterion C at the local level** as an excellent collection of early-twentieth-century residential architecture. It has no notable association with an important event in the development of the city or other activities that shaped the community (Criterion A), and no ties were found to link this district to a notable individual (Criterion B).

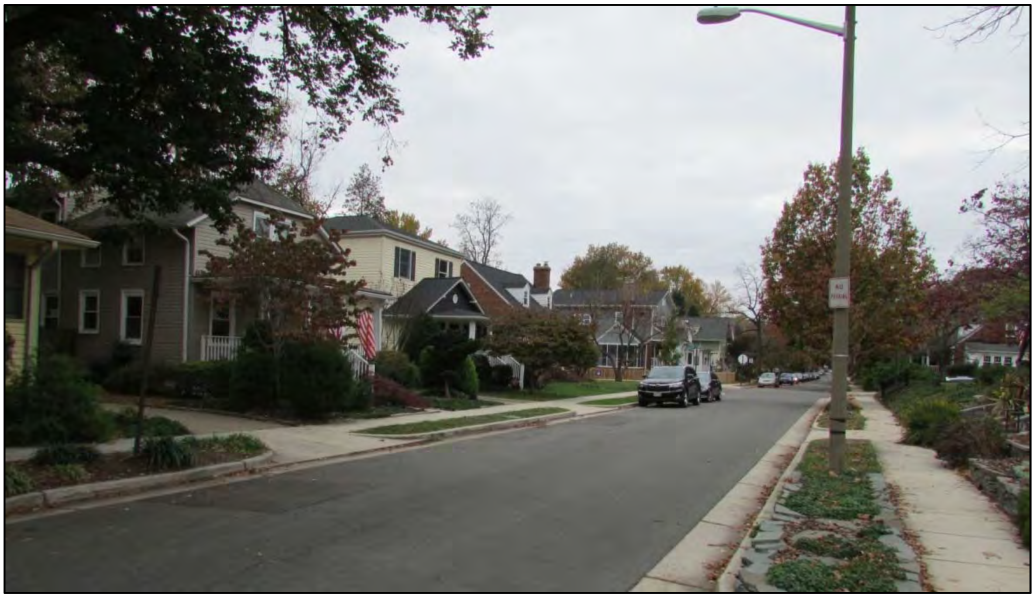

FIGURE 3-52: THE EAST ROSEMONT HISTORIC DISTRICT (100-5341), LOOKING NORTH ALONG MAPLE STREET

Shiloh Baptist Church (New Site) (111-0132-0147) is located at 521 Princess Anne Street in Fredericksburg. The resource is a two-story, multi-bay church constructed in the Colonial Revival style around 1896 (Figure 3-53). The congregation has played a significant role in the lives of African-American residents for over 150 years, remaining a cultural hub today. **It is recommended potentially eligible for the NRHP under Criterion A and Criteria Consideration A**. The church's form and materials are common to the era and area in which it was constructed, it is not the work of a master, and it is not known to be an outstanding example of its type or style. For these reasons, it is recommended not eligible for the NRHP under Criterion C. It has no known association with any individuals of historical significance and is therefore recommended not eligible under Criterion B. The church has been previously identified as a contributing element of the Fredericksburg Historic District (111-0132). As it continues to reflect the history of this area and retains a high level of historic integrity, it is **recommended to remain a contributing resource within this district.**

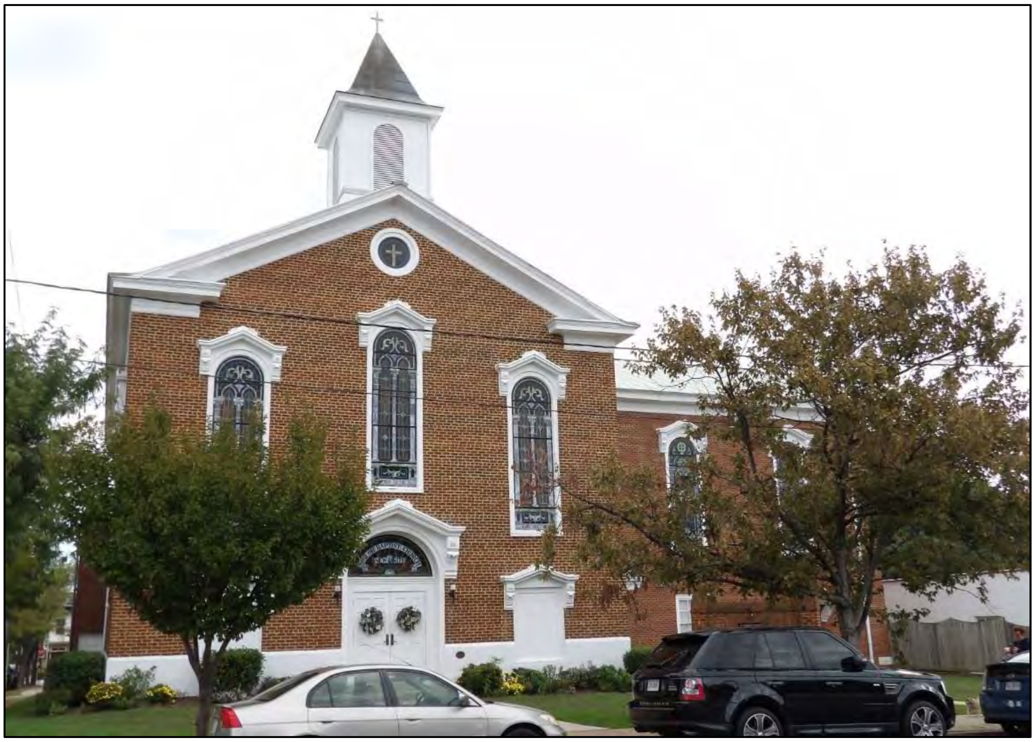

FIGURE 3-53: SHILOH BAPTIST CHURCH (NEW SITE) (111-0132-0147), SOUTHWEST ELEVATION

The building currently occupied by the Hanover County School Board (166-5073-0024) at 200 Berkley Street in Ashland is believed to have been the area's first high school for African-American students. The building is a two-story, multi-bay, educational building constructed around 1948 in the International style (Figure 3-54). Due to its association with African-American history in Ashland, the resource is **recommended potentially eligible for the NRHP under Criterion A at the local level.** This resource is a good example of the International style, a form not frequently seen in Ashland. Therefore, **it is recommended that this resource be considered potentially eligible for the NRHP under Criterion C**. It has no known association with any individuals of historical significance and is therefore recommended not eligible for the NRHP under Criterion B. This resource is located within the boundaries of the potentially-eligible Berkleytown Historic District (111-5073) and was constructed during its period of significance from 1910 to 1968. Therefore, the Hanover County School Board at 200 Berkley Street is **recommended as contributing to the Berkleytown Historic District.**

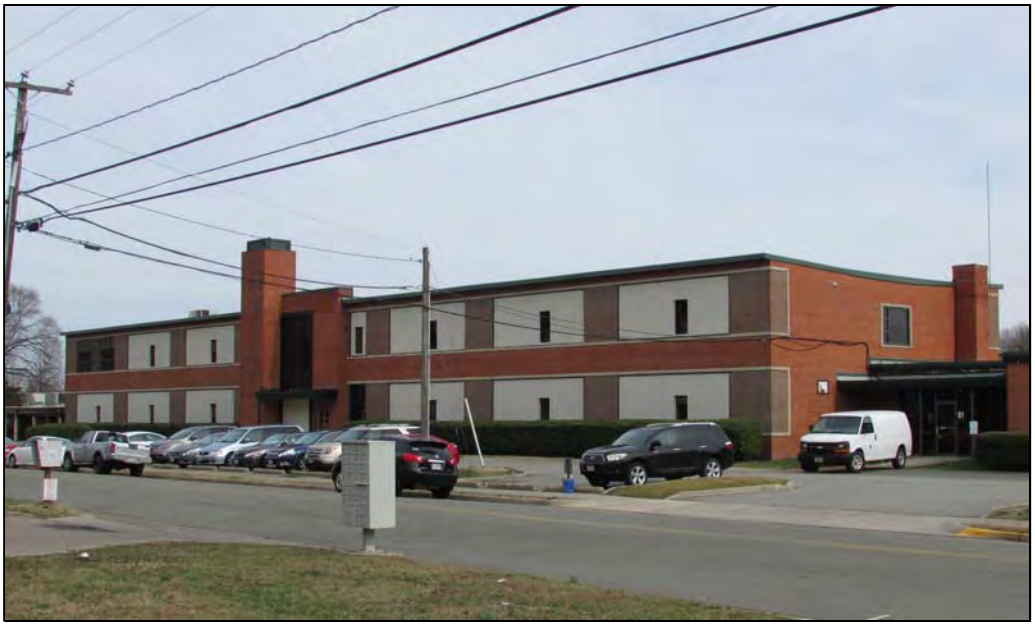

FIGURE 3-54: HANOVER COUNTY SCHOOL BOARD BUILDING (166-5073-0024), SOUTHWEST OBLIQUE

The remaining 225 resources are recommended not individually eligible for the NRHP. As with the previously recorded, not-eligible resources, an overwhelming majority of these properties are twentieth-century residential buildings with no notable significance at the local, state, or federal level. The oldest resource in this collection is the House at 211 Andrew Chapel Road (089-5605) in Stafford County, built in 1900. Several properties built around 1960 represent the later years in this grouping, including the House at 85 Morton Drive (089-5606) in Stafford County; Commercial Building on Compton Road (043-5890) and Commercial Building at 7135 Staples Mill Road (043-5899) in Henrico County; and Miller Total Clean, Inc. at 2212 Deepwater Terminal Road (127-7070) in Richmond.

Of the 225 resources recommended not individually eligible for the NRHP, 59 are recommended as contributing elements to their surrounding historic districts. They include:

Not Eligible/Contributing to the Rosemont Historic District (100-0137) (n=1)*:* 100-0137-0314

Not Eligible/Contributing to the East Rosemont Historic District (100-5341) (n=50)*:* 100-5345, 100-5346, 100-5347, 100-5348, 100-5349, 100-5350, 100-5351, 100-5352, 100-5353, 100-5354, 100-5355, 100-5356, 100-5357, 100-5358, 100-5359, 100-5360, 100-5361, 100-5362, 100-5366, 100-5367, 100-5368, 100-5369, 100-5370, 100-5371, 100-5372, 100-5373, 100-5374, 100-5375, 100-5376, 100-5377, 100-5378, 100-5379, 100-5380, 100-5381, 100-5382, 100-5383, 100-5384, 100-5385, 100-5386, 100-5387, 100-5388, 100-5389, 100-5390, 100-5391, 100-5392, 100-5393, 100-5394, 100-5395, 100-5396, and 100-5397

Not Eligible/Contributing to the Berkleytown Historic District (166-5073) (n=7): 166-5073-0018, 166-5073-0019, 166-5073-0020, 166-5073-0021, 166-5073-0022, 166-5073-0025, and 166-5073-0023

Not Eligible/Contributing to the Richmond, Fredericksburg & Potomac (RF&P) Railroad Historic District (500-0001) (n=1): 500-0001-0059

The remaining 166 are not located in a historic district and/or do not contribute to the overall eligibility of a district. These resources are: 000-9818, 020-5783 through 020-5793, 042-5785 through 042-5790, 042-5791, 043-5865 through 043-5917, 043-6057, 043-6058, 076-5838, 076-5890, 076-5891, 089-5605, 089-5606, 100-5342 through 100-5344, 100-5363 through 100-5365, 111-5434, 111-5435, 127-7066 through 127-7078, 127-7143 through 127-7145, 127-7157 through 127-7171, and 166-5083 through 166-5130.

4 SUMMARY AND RECOMMENDATIONS

On behalf of the DRPT, Dovetail conducted a reconnaissance-level architectural survey of additional segments within the Preferred Alternative of the DC2RVA project. The project is being completed as DHR File Review #2014-0666. From 2014 through 2016, the DC2RVA team conducted architectural reconnaissance studies on all Project alternatives inclusive of all areas within 500 feet of the centerline of each alternative corridor (the project APE). This resulted in the recordation of thousands of buildings, structures, objects, and districts. Since these studies, engineering associated with the development of the Project alternatives has resulted in a slightly expanded LOD to accommodate road modifications, straightening curves, the addition of wyes, proposed station locations, parking areas, etc. The expanded LOD areas were not included in the original architectural reconnaissance study.

In total, the DC2RVA Project Team surveyed 352 historic architectural resources within the LOD area, including 124 previously recorded and 228 newly recorded. Two resources were previously listed on the National Register of Historic Places, and it is recommended that both remain listed: Rippon Lodge (076-0023) and the Town of Barton Heights Historic District (127-0816).

As a result of the current study, 11 properties are recommended to be potentially eligible for the NRHP based on the current survey: East Rosemont Historic District (100-5341), Chancellor House (111-0013/111-0132-0508), Hackley-Monroe House/James Monroe House/Joseph Jones House (111-0038/111-0132-0509), Dr. Charles Mortimer House at 213 Caroline Street (111-0067/111-0132-0505), the 1770 House (111-0132-0126), Shiloh Baptist Church (New Site) (111-0132-0147), Robert Adams Residence (111-0132-0458), Loving's Produce Co. (127-0344-0102), Philip Morris Operations Complex (127-5818), Gilpin Court Apartment Complex (127-6883), and Hanover County School Board (166-5073-0024). One resource, Hoopers (042-0556) was not accessible during the current survey, thus it is recommended that further study be completed to determine eligibility.

The remaining 338 resources are recommended not individually eligible for the NRHP, although 126 are recommended to be contributing elements to surrounding historic districts, including the Rosemont Historic District (100-0137), East Rosemont Historic District (100-5341), Boundary Markers of the Original District of Columbia 000-0022, Fredericksburg Historic District (111-0132), Berkleytown Historic District (166-5073), Laurel Industrial School Historic District (043-0292), Town of Barton Heights Historic District (127-0816), Seaboard Air Line Railroad Corridor (127-5271), and the RF&P Railroad Corridor/Historic District (500-0001).

Table 4-1 contains summary data on all of the 352 recorded properties.

TABLE 4-1: SUMMARY OF SURVEYED RESOURCES AND RECOMMENDATIONS (ORGANIZED BY RESOURCE NUMBER)

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
000-0022-0003	Southwest No. 2 Boundary Marker, Russell Road at King Street	City of Alexandria	1792	Not Eligible; Contributing to Boundary Markers of the Original District of Columbia
000-9818	DC Warehouse MA-134, off of Airport Access Road and Mt. Vernon Parkway	Arlington County	ca. 1964	Not Eligible
020-5392	Terminal Office, 5801 Jefferson Davis Highway	Chesterfield County	ca. 1958	Not Eligible

ABSTRACT

Dovetail Cultural Resource Group (Dovetail), as a member of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project Team and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of the DC2RVA Project. The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666. Dovetail and the DC2RVA Team completed 16 reports detailing the results of the reconnaissance-level survey and coordinated the results with the DHR between 2015 and 2017.

Subsequent analysis included an investigation-level evaluation of architectural resources recommended potentially eligible for listing in the National Register of Historic Places (NRHP) during the reconnaissance-level survey that are located within the Preferred Alternative of the DC2RVA Project. The goals of this investigation were to: first, document the architectural and landscape features of the properties; second, gather archival data on the properties; and third, examine the physical and historical information collected within the appropriate context(s) to properly evaluate each property under established criteria for the NRHP. The fourth goal of this investigation was to propose NRHP boundaries for any property should it be recommended eligible for listing. Work on this project was conducted in 2017 and 2018, in accordance with relevant state and federal regulations as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800).

In total, the DC2RVA Project Team surveyed 54 historic architectural resources at the evaluation level, 13 of which are detailed in the current report (the remaining 42 resources will be presented in subsequent reports). Of those 13 resources, the DC2RVA Project Team is recommending that 11 are individually eligible for listing in the NRHP (088-0254, 111-0009, 111-0009-0795, 111-0132-0020, 111-0132-0025, 111-0132-0522, 111-0132-0704, 127-6792, 127-6793, 500-0001, and 500-0001-0022) while two (111-0023 and 127-6840) are recommended not individually eligible.

1 INTRODUCTION

Dovetail Cultural Resource Group (Dovetail), on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of resources along the Preferred Alternative of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project. The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

The FRA and DRPT propose passenger rail service and rail infrastructure improvements in the north-south travel corridor between Washington, D.C. and Richmond, VA. These passenger rail service and rail infrastructure improvements are collectively known as the DC2RVA Project. The Project will deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. The Project is part of the larger Southeast High Speed Rail (SEHSR) corridor (Figure 1-1), which extends from Washington, D.C. through Richmond, VA; and from Richmond continues east to Hampton Roads (Norfolk), VA and south to Raleigh, NC; and Charlotte, NC, and then continues west to Atlanta, GA, and south to Florida. The Project connects to the National Railroad Passenger Corporation (Amtrak) Northeast Corridor (NEC) at Union Station in Washington, D.C.

The purpose of the SEHSR program, as stated in the 2002 Tier I Final Environmental Impact Statement (EIS) completed for the full SEHSR corridor, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. The purpose of the current Washington, D.C. to Richmond SEHSR project described here is to fulfill the purpose of the SEHSR Tier I EIS within this segment of the larger SEHSR corridor. The Project, by increasing rail capacity and improving travel times between Washington, D.C. and Richmond, will improve passenger train frequency, performance and reliability in the corridor, enabling intercity passenger rail to be a competitive transportation choice for travelers between Washington, D.C. and Richmond and beyond.

Given FRA's funding involvement and permitting through various other federal agencies, the DC2RVA project is required to comply with Section 106 of the National Historic Preservation Act of 1966, as amended, and the Act's implementing regulations under 36CFR800. Additionally, all cultural resource work was designed by DRPT and Dovetail to comply with the Virginia Antiquities Act (Code of Virginia § 10.1-2300) and guidelines and regulations promulgated by the DHR as necessary.

Previous Project studies included a reconnaissance survey of all alternatives under consideration, completed between 2015 and 2017. In September 2017, a DRPT-recommended Preferred Alternative was presented in the Draft Environmental Impact Statement (EIS). DRPT's recommended Preferred Alternative was approved by the Commonwealth Transportation Board for recommendation to FRA in December 2017. Intensive-level architectural studies were therefore completed for all above-ground resources determined to be potentially eligible by the DHR within the area of potential effects (APE) of the Commonwealth's recommended Preferred Alternative. The current report focuses on the results of the intensive-level investigations completed by Dovetail on 13 of the 54 architectural resources that comply with these study parameters, organized in the body of this report in geographical order from north to south. The remainder of the resources will be detailed in separate reports (Table 1-1).

1.1 PROJECT LOCATION

The Washington, D.C. to Richmond corridor spans approximately 123 miles along the existing rail corridor owned by CSX Transportation (CSXT) between Control Point RO (milepost [MP] CFP 110) in Arlington, VA, to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County) (Figure 1-2). For the purposes of conceptual engineering and environmental planning, the DC2RVA corridor has been subdivided into 6 Areas that correspond with improvements and alternatives, and as such have been named and numbered from north to south (Figure 1-2). At the northern terminus in Arlington, VA, the Project limit for infrastructure improvements ends at the southern approach to Long Bridge, a double-track rail bridge taking the rail corridor over the Potomac River; however, the northern terminus of Union Station in Washington, D.C. is used for ridership and revenue forecasting, as well as service development planning within the Project corridor. The southern terminus in Centralia is the junction of two CSXT routes that begin in Richmond and rejoin approximately 11 miles south of the city.

Proposed improvements are along CSXT-owned track and right-of-way, generally parallel to the I-95 corridor between northern Virginia and Richmond. From north to south, the project travels through the following counties and cities:

- Arlington County
- City of Alexandria
- Fairfax County
- Prince William County
- Stafford County
- City of Fredericksburg
- Spotsylvania County
- Caroline County
- Hanover County
- Henrico County
- City of Richmond
- Chesterfield County

In Arlington, the Project connects to existing CSXT track extending across the Potomac River on the Long Bridge into Washington, D.C. and Union Station, the southern terminus of Amtrak's Northeast Corridor (NEC). At Centralia, the Project connects to both the Richmond to Raleigh segment of the SEHSR corridor and the Richmond to Hampton Roads segment of the SEHSR corridor.

The Washington, D.C. to Richmond segment is an integral part of the overall Washington, D.C. to Charlotte SEHSR corridor and provides a critical link between high speed intercity passenger service from Boston to Washington, D.C. and the southeastern United States.

1.2 PROJECT DESCRIPTION

The DC2RVA project will include specific rail infrastructure improvements and service upgrades intended to improve the travel time, service frequency, and on-time performance of passenger trains operating between Washington, D.C. and Richmond, VA. Specific improvements to the existing rail infrastructure between Arlington, VA, and Centralia, VA include:

- Corridor-wide upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and grade crossing improvements.
- Corridor-wide improvements to train operating capacity to achieve higher passenger train service frequency and reliability, including an additional main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other capacity and reliability improvements at certain locations.
- Station and platform improvements for Amtrak and Virginia Railway Express (VRE) stations.

The Tier II EIS being completed for the Project will assess the environmental impacts of these improvements and identify ways to avoid, minimize, or otherwise mitigate such impacts.

Studies in support of the Project address passenger and freight rail operations and service between Union Station in Washington, D.C. and Richmond and beyond, but the Project does not include physical improvements to the Long Bridge across the Potomac River or to rail infrastructure within Washington, D.C. Other projects will address improvements to the rail infrastructure north of Arlington and south of Centralia along the SEHSR corridor.

1.3 CURRENT STUDY

The DC2RVA Team has been conducting reconnaissance-level architectural studies for the entire 123-mile DC2RVA corridor since December 2014. To date, the findings have been detailed in 16 reports. Between January 29, 2016 and March 1, 2017, DHR concurred with the DC2RVA team's recommendations on these 16 reports. In addition, subsequent reconnaissance-level architectural studies are ongoing in areas where the limits of disturbance have been modified since the original work, and the preliminary results have been shared by the DHR to solicit feedback. Through all efforts, the DHR has determined that 54 resources are individually potentially eligible for the NRHP within the Commonwealth's recommended Preferred Alternative. As such, the DC2RVA team is currently completing intensive-level surveys on those 54 properties (Table 1-1). This report includes the results of the intensive-level investigations on 13 of the 54 resources (Report A). The remaining 41 resources will be presented in two subsequent reports (Report B and Report C) (Figure1-3 through 1-6).

Documentation and research for this project were conducted by Dovetail in accordance with relevant state and federal guidelines as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800). Fieldwork and archival research was completed between March 2017 and February 2018. During this period, DHR records were consulted and various municipal and private repositories, including land and tax records, as well as historical and genealogical societies were visited. A background literature and records review of the architectural APE at the DHR was conducted as part of the reconnaissance survey completed during the previous architectural studies for the Project (e.g., Anderson and Staton 2016; Staton and Lesiuk 2015).

2 METHODOLOGY

The architectural investigation for the DC2RVA Project was conducted to examine any historic buildings, objects, or districts over 48 years in age for NRHP eligibility concurred by DHR to be potentially eligible for listing in the NRHP. Each potentially eligible resource was evaluated with regard to NRHP Criterion A, for its association with events that have made a significant contribution to the broad patterns of our history; Criterion B, for its association with people significant in our nation's history; Criterion C, for its embodiment of distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or possess high artistic values. As part of the current survey, these architectural resources were not evaluated under Criterion D for its potential to yield information important in history. Additionally, each resource's integrity was addressed through seven aspects or qualities: location, design, setting, materials, workmanship, feeling, and association. Criteria considerations were taken into account only where necessary. This report meets the standards set forth by the DHR's architectural survey manual (DHR 2017).

Field recordation included an in-depth physical examination of each resource, including the interiors when accessible; digital photographs documenting the primary elevation, oblique angles, occasionally interiors, and general setting; detailed site plans of the property and floor plans were prepared when applicable. Archival research on each resource was conducted at land record repositories for various municipalities, historical and genealogical societies, online repositories of historic records, local libraries, and the Library of Virginia.

After the architectural fieldwork, research, and evaluation was completed, the Project Team prepared separate Virginia Cultural Resource Information System V-CRIS forms and accompanying documentation for each recorded property in accordance with DHR policies and practices. Each V-CRIS packet includes a V-CRIS form, site plan, set of hard-copy color photographs, and a CD of digital photos for each property to meet with the current DHR standards (DHR 2017).

3 SURVEY RESULTS

Dovetail completed intensive-level architectural investigations on 54 resources determined to be individually potentially eligible for the NRHP within the Preferred Alternative, 13 of which are detailed in the current chapter. The remainder of the resources will be examined in separate future reports.

3.1 RF&P BRIDGE OVER OCCOQUAN RIVER (500-0001-0022)

The Richmond, Fredericksburg, and Potomac (RF&P) Railroad Bridge over Occoquan River (500-0001-0022), located east of U.S. Route 1 Highway (Route 1) in Woodbridge, Virginia, is a 1915 Parker through-truss railroad bridge that crosses the Occoquan River. It also spans the jurisdiction line between Fairfax and Prince William counties in a developed suburban setting of industrial, commercial, and residential buildings (Figure 3-1). The bridge carries the historic RF&P Railroad (500-0001), now owned and operated by CSXT. The structure is one of three bridges that cross the river at this location; the others carry Interstate 95 and Route 1 over the Occoquan

This structure consists of two Parker through trusses supporting a continuous span of steel-plate-deck girders with two simple spans of the same extending from the north approach and four simple spans at the south approach. The bridge has always served as a rail-related resource carrying RF&P, CSXT, and Amtrak trains and is not accessible to vehicular or pedestrian traffic. Due to the nature of the resource, access was restricted to the CSXT right-of-way, limiting survey of the whole structure. The following section includes a history of the structure based on archival research, an architectural description, and an analysis with a statement of significance.

3.1.1 Historic Context

The area of Woodbridge and Occoquan has had a wide variety of modes of transportation across the Occoquan River. Like other eastern states during the mid-nineteenth century, Virginia began to see an increase of transportation development with the construction of better horse-drawn roads, steamships, short-lived canals, and railroads, connecting rural areas with commercial centers like Richmond and Washington, D.C. Before rail transportation, stagecoach travel from Richmond to Washington consisted of at least three days of travel including a layover in Fredericksburg (Richmond 2010), but with the introduction of steamships to the area in 1815, travel lessened by a full day.

The RF&P Railroad developed during the mid- to late-nineteenth century to connect Richmond to Washington, D.C. The rail line was chartered in 1834 and constructed track from Richmond to Fredericksburg by 1837. By the start of the Civil War, the rail line had extended to Aquia Creek. Construction was delayed at Aquia due to funding, the war, and the obstacle of the swampy landscape north of Aquia (Brown 2006:90–91; Wright 2015). Prior to the railroad extending to Washington, D.C., passengers stopped at Aquia and took a steamship north.

Adjacent to the bridge of study, a previous railroad bridge existed southeast of the town of Occoquan in Woodbridge and was constructed by H.K. Bradshaw for the Alexandria and Fredericksburg Railroad in 1871–1872 (Figure 3-2) (Griffin 1984:110). This wood trestle bridge received extensive damage from subsequent flooding and was replaced in 1892 by the Pennsylvania Railroad Company with a metal Pratt truss (Alexandria Gazette 1892; Richmond 2010). This bridge was later converted to hold vehicular traffic for Route 1 in 1914 and was damaged by Hurricane Agnes in 1972. Following the hurricane, a temporary bridge was established until 1981 when a permanent replacement was finally constructed (Figures 3-3 through 3-6) (Brown 2006:117). At the time of the Route 1 bridge conversion from rail to automobile in the early-twentieth century, the current RF&P Bridge over the Occoquan River (500-001-0022) was erected (Griffin 1984:110).

Construction began in May 1914 and finished in 1915 at a cost of $300,000 (Engineering and Contracting 1914:55; Richmond Times-Dispatch 1915). Designed by Gustav Lindenthal, the project was supervised by Captain S.B. Rice and constructed by the Phoenix Bridge Company. The foundation and masonry was constructed by John Monks and Sons (Engineering News 1914:294). At the time of construction, the bridge was 875 feet long with two steel Parker trusses of 250 feet each and five steel-deck-plate girders of 75 feet each. However, the current design of the bridge includes an additional two spans on the north and four on the south approaches. No documentation was found to detail any changes to the bridges spans. The circa-1915 bridge allowed improved rail traffic by allowing heavier steam locomotives (Pacific types) to cross the river on double tracks compared to the previous single-track bridge. This bridge continues to serve rail traffic along the former RF&P Railroad.

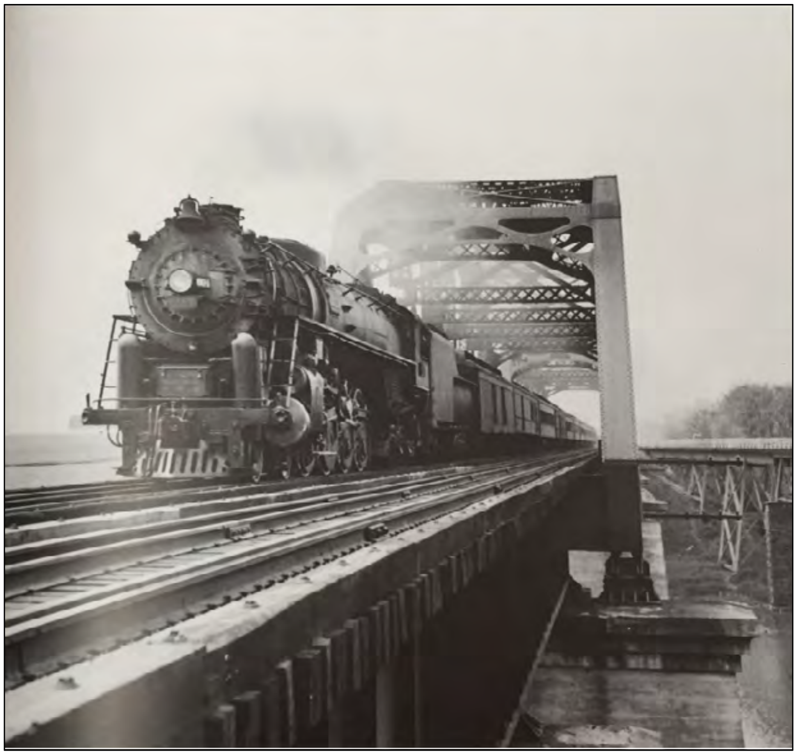

FIGURE 3-5: A PRE-1981 PHOTOGRAPH LOOKING SOUTH TOWARD THE RAILROAD BRIDGE (GRIFFIN 1984:113)

3.1.1.1 Gustav Lindenthal

Gustav Lindenthal (1850–1935), an Austrian civil engineer, designed the well-known Queensboro (1909) Bridge in New York, the Sciotoville Bridge (1917) over the Ohio River, and the Sellwood Bridge (1922) in Oregon. He worked with the Pennsylvania Railroad and the New York Connecting Railroad to create the Hell Gate Bridge, the longest steel arch bridge spanning 1,017 feet in 1916. He immigrated to the United States in 1874 and began his own engineering business in 1881 with projects from New York to Oregon and served as the construction engineer to the Philadelphia Centennial Exposition (1874–1877) (Gandhi 2015; Structurae 2014). Coined the "Dean of American Bridge Builders," he was known for choosing more complex structural forms in his designs (American Society of Civil Engineers [ASCE] 2017). His 1881–1883 Smithfield Street Bridge, a lenticular truss, located in Pittsburgh, Pennsylvania, over the Monongahela River, is listed in the NRHP and designated a National Historic Civic Engineering Landmark and a National Historic Landmark (Pghbridges.com 2017). The Queensboro Bridge in New York was listed in the NRHP in 1978.

3.1.1.2 Phoenix Bridge Company

Originally known as the Phoenix Iron Works in 1790, the Phoenix Bridge Company was located in Phoenixville, Pennsylvania, and began producing nails and, later, other metal products from pig iron and wrought iron to the Griffin Gun cannon for the Civil War. The company also patented the Phoenix Column which allowed lighter, stronger structural supports. With the success of the column, the company then began constructing bridges across the country under a subsidiary firm known as the Phoenix Bridge Company (Lemelson Center 2014). The company continued through the mid-twentieth century but declined due to the saturation of the market and increase of reinforced concrete bridge designs, closing in 1962 (Historical Society of the Phoenixville Area n.d.). Well-known examples of their work include the 1887 Phoenix Bridge in Eagle Rock, Virginia (011-0095, NRHP listed in 1975), Etters Bridge in Cumberland County, Pennsylvania (NRHP listed in 1986), County Line Bowstring Bridge near Concordia, Kansas (NRHP listed in 1990), and the Hays Street Bridge in San Antonio, Texas (NRHP listed in 2012) (Bridgehunter.com 2007, 2017a; Versaw 1985; Virginia Department of Highways and Transportation 1975).

3.2.1 Architectural Description

The current bridge is the third crossing the Occoquan River and appears to be relatively intact from its 1915 construction. The bridge consists of two centrally located, steel, Parker-type, through trusses with steel-plate deck girders extending to the north south approaches, totaling eight spans of approximately 920 feet (Figure 3-7) (DRPT 2016). The riveted bridge rests on concrete abutments with seven solid-wall concrete piers and carries two rail tracks on an open ballast deck. Although publicly available records are limited, it appears that the bridge has had some repairs over the years, specifically with some bolt replacements (Figure 3-8). The portal bracing, top chords, top lateral bracing, vertical posts, diagonals, and bottom chords appear to be intact (Figure 3-9).

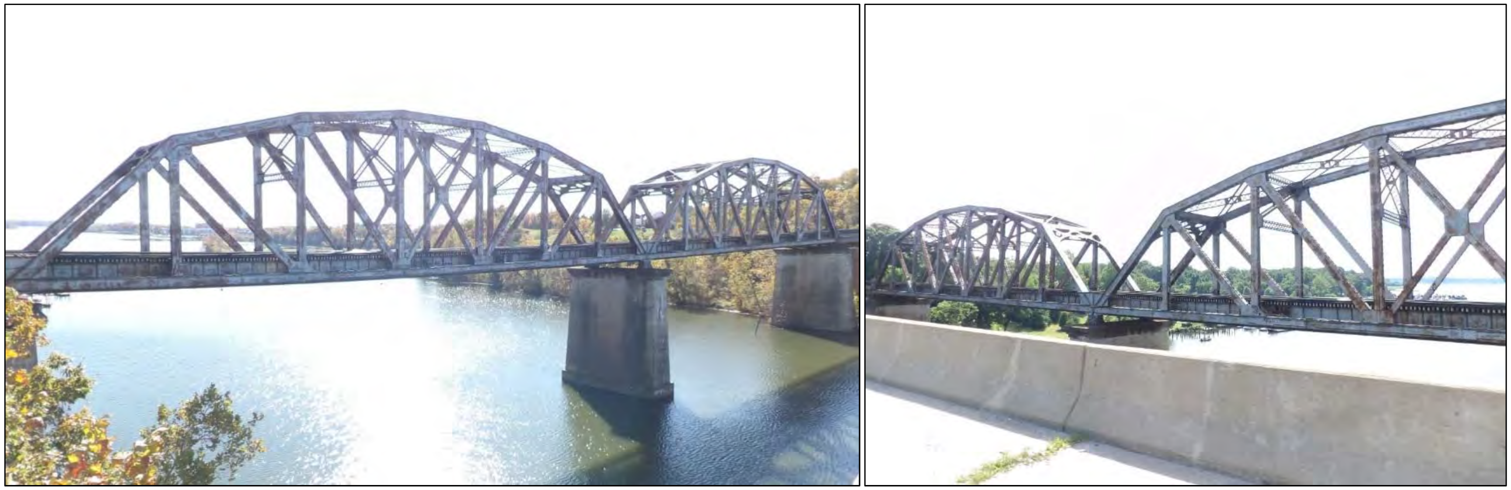

FIGURE 3-6: VIEW OF THE WEST ELEVATION OF THE BRIDGE, LOOKING SOUTHEAST FROM ROUTE 1 (LEFT); LOOKING NORTHEAST FROM ROUTE 1 (RIGHT)

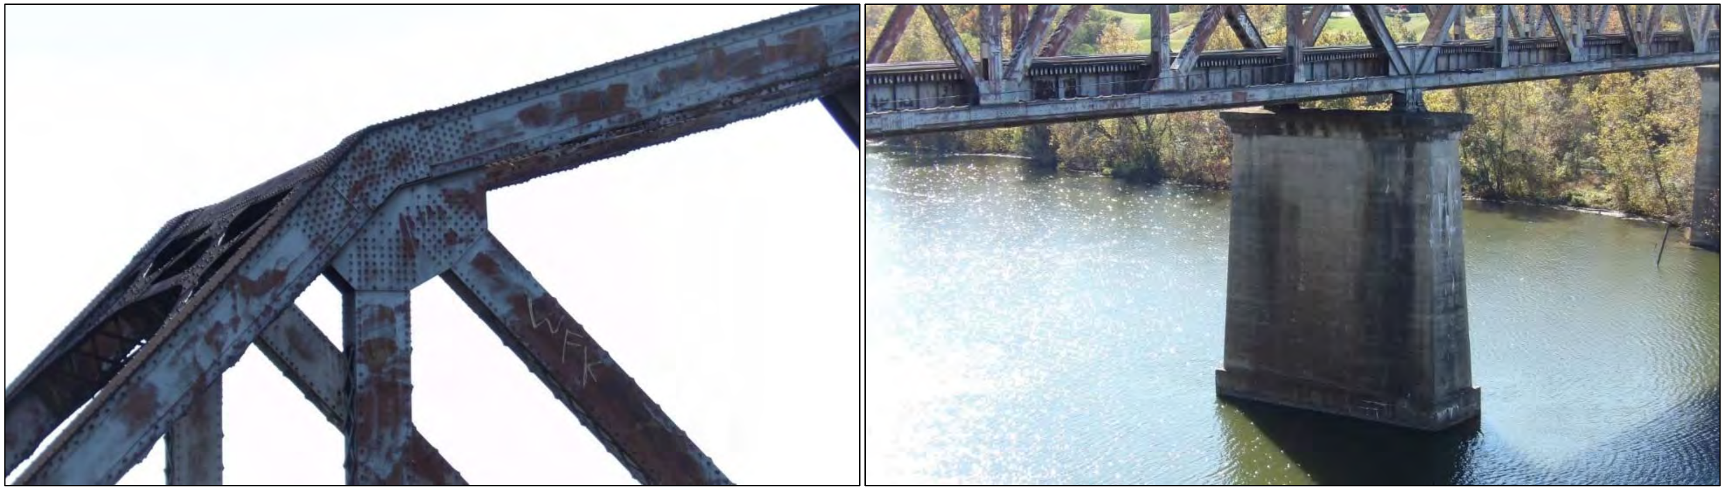

FIGURE 3-7: CLOSE-UP OF THE RIVETED CONNECTIONS ALONG THE TOP CHORDS AT THE NORTHERN APPROACH (LEFT); CLOSE-UP OF ONE OF THE POURED CONCRETE SOLID-WALL PIERS, LOOKING SOUTHEAST (RIGHT)

Previous records note these trusses as a Camelback design. As defined in the *Historic Context for Common Historic Bridge Types*, a "camelback is a variation of the Parker truss. Most camelback trusses are essentially Parker trusses with exactly five slopes in the upper chord and end posts" (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3-35). Since the two trusses have seven segments including the end posts, they are Parker trusses.

The Parker truss was developed and patented by Charles H. Parker, a mechanical engineer from Massachusetts in 1870 (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3–34). His design modified the previously patented Pratt truss bridge type and its signature polygonal top chord (Figures 3-9 through 3-11) (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3–34). This allowed for the use of less metal due to the shortening of the vertical and diagonal members as they splayed from the center of the truss to the ends. The design became economical for bridges spanning over 160 feet or more, and with the development of highway departments in the 1920s onward, these structures began to be standardized.

3.1.3 NRHP Evaluation

Today, the RF&P Railroad Bridge over the Occoquan River (500-0001-0022) is still used as a railroad bridge carrying CSXT, Amtrak, and VRE trains across the Occoquan River. The bridge appears to be in good condition, denoted by its ability to carry varying weight loads from freight and passenger traffic. Access to the bridge was limited to the accessible CSXT rights-of-way. Much of the bridge was not closely inspected due to the height of the bridge's superstructure t and clearance from the river.

Constructed for the RF&P Railroad (500-0001), this structure served as a replacement to an earlier circa-1892 railroad truss bridge that was converted to vehicular traffic along Route 1 around 1914 during a time that the railroad company was updating their infrastructure. The bridge allowed the rail line to pass over the Occoquan River, the northernmost large body of water along the line, before reaching the Potomac River and Washington, D.C., its terminus. DHR files also note that in 2001, staff determined that the bridge was contributing to the RF&P Railroad (500-0001) and, was therefore, "eligible for the NR [National Register] in the broader context of the RR [Railroad]" (Richmond 2010).

There is little data to support that the bridge is individually significant for its association to important events in transportation as it was a replacement to an earlier bridge that crossed the Occoquan River. Therefore, it is recommended not eligible for inclusion in the NRHP under Criterion A.

This resource is not known to have any associations with individuals who have made significant contributions to history, and is, therefore, recommended not eligible for the NRHP under Criterion B. Architects, engineers, and builders of historic properties are more appropriately considered within the context of a resource's design under Criterion C. The RF&P Railroad Bridge over Occoquan River was designed by Gustav Lindenthal and constructed by Captain S.B. Rice with the Phoenix Bridge Company. Although Lindenthal was a prominent civil engineer, having designed the Smithfield Street Bridge in Pittsburg, Pennsylvania (1883), the Queensboro Bridge in New York City (1909), and the Hell Gate Bridge in New York City (1912), this bridge is one of his simpler, smaller designs (Gandhi 2015:301). As larger and more complex designs of Lindenthal's work survive elsewhere today, this resource does not exhibit the mastery of his construction methods.

According to data gleaned from CSXT, this railroad bridge is the only metal through truss along the 124-mile RF&P Railroad line, and from the *Survey of Metal Truss Bridges in Virginia*, there are only three Parker through-truss bridges in the Commonwealth of Virginia, all of which are vehicular (Miller and Clark 1997:45). These Parker trusses in Virginia range in age from 1872 to 1938 (Miller and Wallingford 2014). The *Context for Common Historic Bridge Types* notes that "examples dating after the first two decades of the twentieth century are substantially less significant than" earlier examples; the 1915 bridge predates this period (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3–35).

Character-defining features of Parker truss bridges include polygonal top chord, inclined end posts, panel diagonals, varied-length verticals from end to center panels, floor beams, stringers, and struts (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3-35). The RF&P Railroad Bridge over Occoquan River (500-0001-0022) appears to have retained many of these features, rendering it a high level of integrity of location, design, setting, materials, workmanship, feeling, and association. No other examples of this type of bridge are known to exist along the RF&P Railroad's corridor. It is recommended that this resource is eligible for inclusion in the NRHP under Criterion C as an example of a rare example of the Parker truss design in Virginia. As an architectural resource, this property was not evaluated under Criterion D.

As previously noted, this resource is located within the RF&P Railroad Historic District (500-0001) (Figure 1-6). This railroad bridge was constructed during the RF&P's period of significance (1837–1943) and is representative of transportation-related structures of this era. For this reason, it is recommended that the bridge remain a contributing resource to the RF&P Railroad Historic District (500-0001). For additional information on the RF&P Railroad Historic District (500-0001), see page 3-154.

In sum, the RF&P Bridge over Occoquan River (500-0001-0022) is **recommended eligible for individually listing in the NRHP under Criterion C as an example of a rare early truss design in the Commonwealth of Virginia**. It also **recommended that the resource remains contributing to the RF&P Railroad Historic District (500-0001).**

The proposed NRHP boundaries for the RF&P Bridge over Occoquan River strictly outline the footprint of the bridge (Figure 3-11). The period of significance for the bridge starts in 1915, its date of construction, and extends to 1968 for its continued use as a railroad bridge. This end date follows the NPS guidelines which say: "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (National Park Service [NPS] 1997).

3.2 RAPPAHANNOCK RIVER RAILROAD BRIDGE (111-0132-0025)

The Rappahannock River Railroad Bridge (111-0132-0025) is a multi-span, open-spandrel, concrete-arch railroad bridge, originally constructed to serve the RF&P Railroad (500-0001) between the City of Fredericksburg and Stafford County, VA (Figure 3-12). The current bridge is the latest in a series of bridges built for the railroad beginning in the 1830s to cross the Rappahannock River. On the north, the bridge extends into an industrial area. The railroad bed is predominantly screened from view by dense, mature tree growth and underbrush along both sides. To the south, the bridge passes into the City of Fredericksburg's downtown core on an elevated track, running parallel to Lafayette Boulevard. The raised track crosses perpendicularly over Sophia and Caroline Streets before arriving at the Fredericksburg Train Station (001-0132-0704), located between Caroline and Princess Anne Streets. Commercial properties, townhomes, and paved-asphalt parking lots border the railroad corridor to the north and south in the city.

3.2.1 Historic Context

The RF&P Railroad first began operations through the City of Fredericksburg in 1837, creating the first link in a rail transportation chain that would eventually connect the Virginia state capital with the nation's capital in Washington, D.C. (McGehee 1992). Initially begun in Richmond, a segment of the RF&P was completed in 1836 to Hazel Run and then expanded to Fredericksburg the following year.

Even though the railroad did not reach Washington, D.C., until the 1870s, the section from Richmond to Fredericksburg was a significant transportation artery throughout the 1840s and 1850s, moving passengers and freight through central Virginia quickly and efficiently. During the Civil War, this railroad became a hotly-contested asset. Between 1861 and mid-year 1862, the RF&P was used by both Union and Confederate forces at various times, and both sides would damage or destroy sections of track to impede their enemy's advance or to delay pursuit during a retreat. For example, a previous Rappahannock River railroad bridge was destroyed in May 1862 as Union forces withdrew toward Washington, D.C. Following the Peninsula Campaign, it was rebuilt by October 1862 (RF&P Railroad 1863). It was destroyed again, this time by the Confederate Army, prior to the First Battle of Fredericksburg later that December (Figure 3-13).

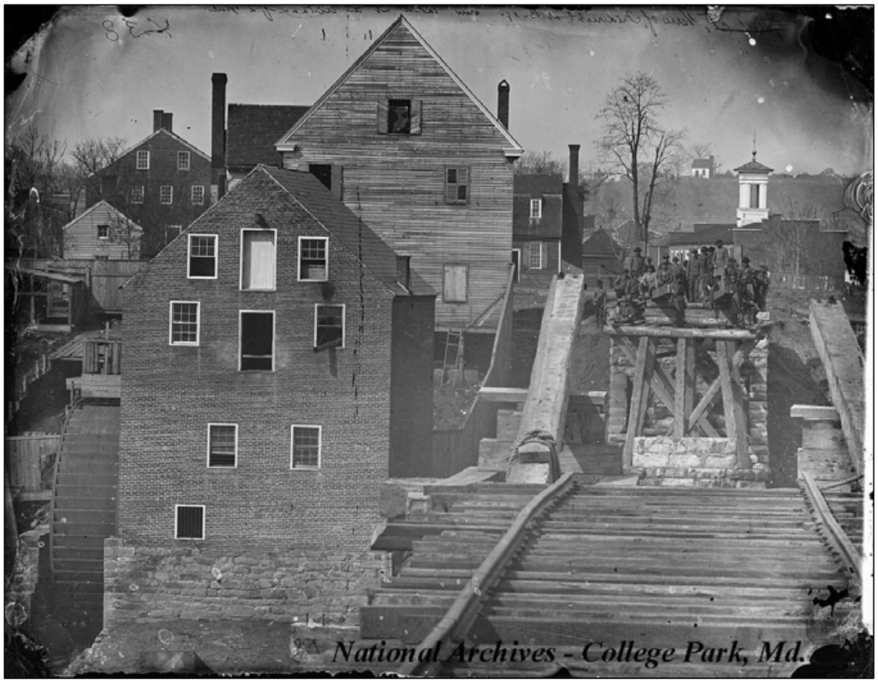

FIGURE 3-13: CONFEDERATE SOLDIERS OBSERVE UNION PHOTOGRAPHER CAPT. ANDREW RUSSELL ACROSS THE RUINS OF THE ORIGINAL RAPPAHANNOCK RIVER RAILROAD BRIDGE PRIOR TO THE 1863 CAMPAIGN SEASON (LIBRARY OF CONGRESS [LOC] 1863)

The RF&P Railroad Company continued to maintain and repair structures along the entire railroad throughout the late-nineteenth and early-twentieth centuries. By the early 1910s, the railroad company began to once again modernize its bridges. Noted engineer and bridge designer, John E. Greiner, was awarded the contract to replace the Rappahannock River Railroad Bridge in the mid-1920s (Mordecai 1940). He designed an open-spandrel, concrete-arch bridge with nine spans, which was put into service on May 1, 1927 (Figure 3-14) (RF&P Railroad 1927). In his proposal, he estimated the cost of the improvements to the Fredericksburg Station and its surrounding area to be $1,180,000 (Greiner and Company 1924). The bridge, however, was constructed with 10 spans, adding a third span on the eastern embankment and varying from historic plans. The new bridge was built as an integral part of a larger major improvement project in Fredericksburg that included elevating the rail tracks to allow for vehicular traffic to pass below, double tracking the system through town, and enlarging the station to accommodate an increased volume of both passenger and freight traffic (Figures 3-15 through 3-17). The bridge continues to serve rail traffic, including Amtrak, VRE and CSXT.

3.2.1.1 John E. Greiner

John E. Greiner (1859–1942) was an architect and civil engineer who established the firm of Greiner Engineering in 1908, which was later acquired by the URS Corporation in 1996 (URS Corporation was later acquired by AECOM in 2014) (Tatman 2017). Greiner designed bridges in the first half of the twentieth century from Maine to Florida, including the Appomattox Bridge in Petersburg, Virginia (Bridgehunter.com 2017b, 2017c). A former Baltimore and Ohio Railroad and Philadelphia Bridge Company engineer, he worked for engineer Gustav Lindenthal on the Seventh Street Bridge in Pittsburgh, Pennsylvania. Also during his time under Lindenthal, Greiner was involved in the design of the Hanover Street Bridge in Baltimore, Maryland, a 1916 bascule bridge, a moveable bridge that lifts the deck by trunnions and counter-weights recommended NRHP eligible by the Maryland Historical Trust (Crampton and Abell 1994; Pghbridges.com 2017; Structurae 2017). Greiner and his company predominantly worked in the Baltimore area after 1904 when he was involved in establishing a new building code for the city of Baltimore following an extensive fire. He constructed the Rappahannock River Railroad Bridge and the James River Arch Bridge (1919) for the RF&P Railroad. His significant bridges include the Hanover Street Bridge, Howard Street Bridge (1938), the Governor Harry W. Nice Memorial Bridge (1938), and the Thomas J. Hatern Memorial Bridge (1939), all of which remain in use (Maryland State Archives 2017). One of his prominent bridges is the 1926 Bridge of Lions in St. Augustine, Florida, which is listed in the NRHP (Steinbach and Paarlberg 1982).

3.2.1.2 Reinforced Concrete Open Spandrel Arch

Construction of the reinforced-concrete, open-spandrel, arch bridge type occurred between 1906 through 1940; it was a dominant bridge design in the 1920s and 1930 when materials and funds were limited (Figure 3-18) (Parsons Brinckerhoff and Engineering and Industrial Heritage 2005:3-67). The reinforced concrete allowed the cost of construction to decrease with the elimination of spandrel walls and fill material while also reducing the dead load. Due to their design and openness, this bridge type was also preferred in scenic locations such as the Rappahannock River. The design's popularity was succeeded by pre-stressed steel beam and reinforced-concrete girder bridges.

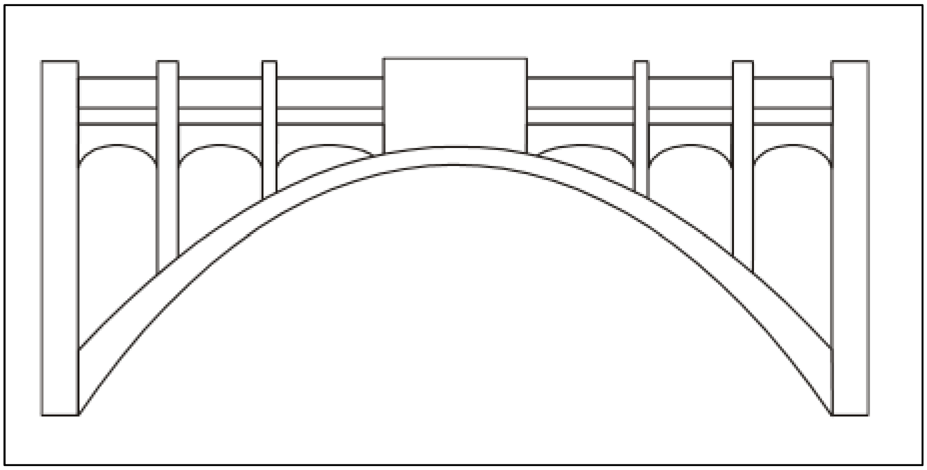

FIGURE 3-18: AN OPEN SPANDREL RIB CONCRETE ARCH (MILLER ET AL. 2000:11)

3.2.2 Architectural Description

The Rappahannock River Railroad Bridge is a 10-span, 800-foot, open-spandrel, concrete-arch bridge that opened in 1927 to replace an earlier bridge spanning the river (Figure 3-19) (Virginia Department of Rail and Public Transportation 2016). Designed by noted bridge designer, John E. Greiner, the bridge is structurally similar to his James River Arch Bridge in Richmond and is representative of a popular style in the late 1920s. Each of the piers is set on a cylindrical, poured-concrete base sunk into the riverbed with spread footings. Its poured-concrete open spandrels support the deck, also made of poured concrete (Figure 3-20). At the mid-point of each section of the spandrel wall, centered above the pier foundation, are large, rectangular, poured-concrete decorative elements set on the outside of the bridge and supported by poured-concrete brackets. The poured-concrete deck is covered with composite ballast and supports two lines of track. A metal-rail fence runs along the west side of the bridge (Figure 3-20).

The Rappahannock River Railroad Bridge comprises four subsidiary bridges as it moves through historic downtown Fredericksburg. The first crosses Sophia Street, the closest street that runs parallel to the Rappahannock River. This two-span, circa-1927 bridge is composed entirely of reinforced poured concrete. Each span extends over two single lanes of vehicular traffic, one going in each direction. Its wing walls have recessed panels cast into them while the central pier features a concrete Tuscan pilaster and is further supported by square Tuscan columns. A concrete, square balustrade parapet runs along both sides of the bridge (Figure 3-21).

The second bridge crosses Caroline Street which runs parallel to Sophia Street one block to the west. This four-span, circa-1927 bridge is composed entirely of reinforced poured concrete. Its wing walls are flat and undecorated, unlike those on the Sophia Street bridge, but its piers feature Tuscan pilasters. Its two center spans each shelter a single lane of vehicular traffic, both traveling southeast to northwest. The outermost spans provide pedestrian access beneath the bridge and for the Fredericksburg Train Station (111-0132-0704), located immediately to the north of this bridge. Two lines of track run down the middle of the poured-concrete deck and are flanked by poured-concrete station platforms lined by a poured-concrete, square balustrade (Figure 3-21).

The third bridge crosses Princess Anne Street which runs parallel to Caroline Street one block to the west. This four-span, circa-1927 bridge is also composed entirely of poured concrete. Its wing walls are also undecorated but feature Tuscan pilasters on its piers. The two center spans each cover a single lane of vehicular traffic, both traveling west to east. A concrete median wall separates the lanes on the southeast side of the street. The outermost spans provide pedestrian access along poured-concrete sidewalks. The Fredericksburg Train Station is located immediately to the north of the bridge. Two lines of track run down the center of the bridge’s poured-concrete deck and are flanked by poured-concrete station platforms topped with a poured-concrete square balustrade (Figure 3-22).

The fourth bridge crosses Charles Street which parallels Princess Anne Street one block to the west. This four-span, circa-1927 bridge is also composed entirely of poured concrete. Its wing walls on the south are also undecorated except for capping, but its piers feature the same Tuscan pilasters present on the other three bridges. Its two center spans each shelter a single lane of vehicular traffic, one going in each direction. The two outer spans are much narrower than the central spans and each accommodate a poured-concrete sidewalk for pedestrian traffic. Two lines of track, set within ballast infill, runs across the poured-concrete deck. Poured-concrete, square balustrade parapets flank the bridge on both elevations (Figure 3-22).

3.2.3 NRHP Evaluation

The Rappahannock River Railroad Bridge was built circa 1927 to replace an earlier bridge located in roughly the same area; it was designed by John Greiner. Although Greiner was a prominent architect and civil engineer, designing the Hanover Street Bridge (1916), Howard Street Bridge (1938), the Governor Harry W. Nice Memorial Bridge (1938), the Thomas J. Hatern Memorial Bridge (1939), and the NRHP-listed 1926 Bridge of Lions in St. Augustine, Florida, the bridge over the Rappahannock River is one of his simpler, smaller designs. As larger and more complex designs of Greiner's work survive elsewhere today, this resource does not exhibit the mastery of his construction methods.

The current bridge is a reinforced, poured-concrete, open-spandrel, arch railroad bridge in good condition. There is little data to support that the bridge is individually significant for its association to important events in transportation and community planning as it was a replacement to two earlier bridges that crossed the Rappahannock River. As part of the RF&P Railroad, this corridor greatly influenced local and regional transportation as well as the City of Fredericksburg; however, the bridge itself did not make important contributions to this pattern of events (Shrimpton et al. 1990). Therefore, it is recommended not eligible for individual inclusion in the NRHP under Criterion A.

It has no known association with any person of historical significance and is therefore recommended not eligible for the NRHP under Criterion B. Architects, engineers, and builders of historic properties are more appropriately considered within the context of a resource's design under Criterion C. Although the bridge was designed by celebrated architect and civil engineer, John E. Greiner, who designed two bridges for the RF&P Railroad.

According to DHR records, the Rappahannock River Railroad Bridge is one of only a handful of reinforced, poured-concrete, open-spandrel bridges in the state and is the only example identified with the DHR within the surrounding counties. A majority of the remaining examples are located in southern and western locations like the city of Roanoke or Augusta County and date to the late 1920s (Miller et al. 2000; Parsons Brinckerhoff and Engineering and Industrial Heritage 2005). The Rappahannock River Railroad Bridge appears to be the only open-spandrel, arch railroad bridge along the RF&P line. It retains a high level of integrity of materials, location, association, design, workmanship, setting, and feeling, thereby maintaining its character-defining features including arch ribs, ring, spandrel, spandrel columns, and parapets, piers, abutments, and wing walls. Therefore, it is recommended individually eligible for the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

The Rappahannock River Railroad Bridge is also located within the boundaries of the Fredericksburg Historic District (111-0132). It was constructed during the district's period of significance and is representative of architectural and transportation trends in the city. The resource is also associated with the RF&P Railroad Historic District (500-0001) and was constructed during its period of significance. For additional information on the RF&P Railroad Historic District (500-0001), see page 3-154.

In sum, the Rappahannock River Railroad Bridge is **recommended eligible for the NRHP under Criterion C for being an exemplary example of an open-spandrel bridge** (Figure 3-23). It is also **recommended to remain a contributing resource to the Fredericksburg Historic District (111-0132) and to the RF&P Railroad Historic District (500-0001).** Because this bridge post-dates the

Civil War, the resource is **recommended as a non-contributing resource to the Banks' Ford (088-5181), Battle of Fredericksburg I (111-5295), and Battle of Fredericksburg II (111-5296).**

The proposed NRHP boundaries for the Rappahannock River Railroad Bridge strictly outline the footprint of the resource (Figure 3-23). The period of significance for the Rappahannock River Railroad Bridge starts in 1927, its date of construction, and extends to 1968 for its continued use as a railroad bridge. This end date follows the NPS guidelines which say: "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997).

3.3 DIXON HOUSE (111-0023)

The property at 401–403 Sophia Street, known as the Dixon House, is located in downtown Fredericksburg (Figure 3-24). The lot is bounded by Sophia Street on the west, undeveloped land near the railroad on the north, the Rappahannock River on the east, and Frederick Street Extended on the south.

In August 2015, shortly after the DHR concurrence on the potential eligibility of this resource, the house at 401–403 Sophia Street was demolished. The current narrative provides a brief history of the house and lot followed by photographs of the demolition process and an updated recommendation on NRHP eligibility to complete the evaluation process.

3.3.1 Historic Context

The house at 401–403 Sophia Street was located on Lot 274, added to the original city boundaries in the 1759 town expansion. Like most of the lots in this area, the parcel was owned by Roger Dixon and his wife, Lucy. Roger Dixon was one of the most influential voices on the expansion of the city boundaries, and he was the developer who platted the land on the south side of town and heavily marketed the lots for sale (Historic Fredericksburg Foundation, Inc. [HFFI] 2014:44). Dixon built a capacious dwelling for himself on nearby lower Caroline Street and sold the surrounding parcels off piecemeal as the population of the town grew. He sold Lot 274 in 1764 to William Thompson, a land speculator who lived in London (City of Fredericksburg Deed Book [CFDB] F:426). The lot remained undeveloped throughout the remainder of the eighteenth century, as the parcel passed through several owners.

Most of what were Lots 274 and 275 (located to the north of 274) were owned by James Somerville in the last years of the eighteenth century. Somerville was the third mayor of Fredericksburg. This fact led to the house at 401–403 Sophia Street being known as the “Early Mayor’s House” in the early-twentieth century (although archival research shows that the home was not extant during Somerville’s ownership) (Works Progress Administration [WPA] 1938). Upon his death in 1798, Mayor Somerville passed the property to his nephew, James N. Somerville. At the time Somerville received this property from his uncle, it contained a warehouse and a wharf along the river (City of Fredericksburg Will Book [CFWB] DC:84). A two-story wood dwelling with a rear, full-width, shed-roofed addition was constructed on the lot to the north of what became 401–403 Sophia Street in the early-nineteenth century. This house was never actually occupied by Somerville but rather used, at times, as a rental property and home for nearby warehouse employees.

Between 1815 and 1833, Anthony Buck of Fredericksburg purchased several lots along the Fredericksburg riverfront, one of which was Lot 274. Buck insured the house built by James N. Somerville with the Mutual Assurance Society, renewing the policy several times (Figure 3-25) (Mutual Assurance Society of Virginia [MAS] 1983). Like Somerville, he did not reside on the parcel but rented the structure. Upon Buck's death in 1843, his heirs sold his interest in Lot 274 to John L. Marye. It was Marye who built the house known as 401 Sophia Street. The southern half was the original dwelling, built around 1843 and used as a tenant house (City of Fredericksburg Tax Records [CFTR] 1844–1861). Marye sold the house at 401 Sophia Street to Franklin Slaughter in 1862; Franklin was the brother of then-mayor Montgomery Slaughter. Franklin suffered from notable mental illness and, like the owners before him, he did not occupy the lot. He was actually listed as "insane" on the 1870 and 1880 censuses, and he lived with his family. He died in 1893 at the Western State Mental Hospital in Staunton and is buried in the Fredericksburg City Cemetery (Find a Grave 2008; United States Federal Population Census [U.S. Census] 1870, 1880). Notable for the current study, the house at 401 Sophia Street and the two-story house with the shed-roofed addition to the north were both depicted on several Civil War-era photographs captured by Union troops from the Stafford side of the Rappahannock River (Figure 3-26). These images aid our knowledge of the Fredericksburg riverfront and the state of these homes during the war years.

FIGURE 3-25: MAS INSURANCE POLICY ACQUIRED BY ANTHONY BUCK IN 1818 FOR THE ORIGINAL DWELLING ON LOT 274 (MAS 1983). THE HOUSE AT 401–403 SOPHIA STREET WOULD BE BUILT TO THE SOUTH OF THIS HOUSE ALONG WHAT IS TERMED "SOUTH FREDERICK STREET."

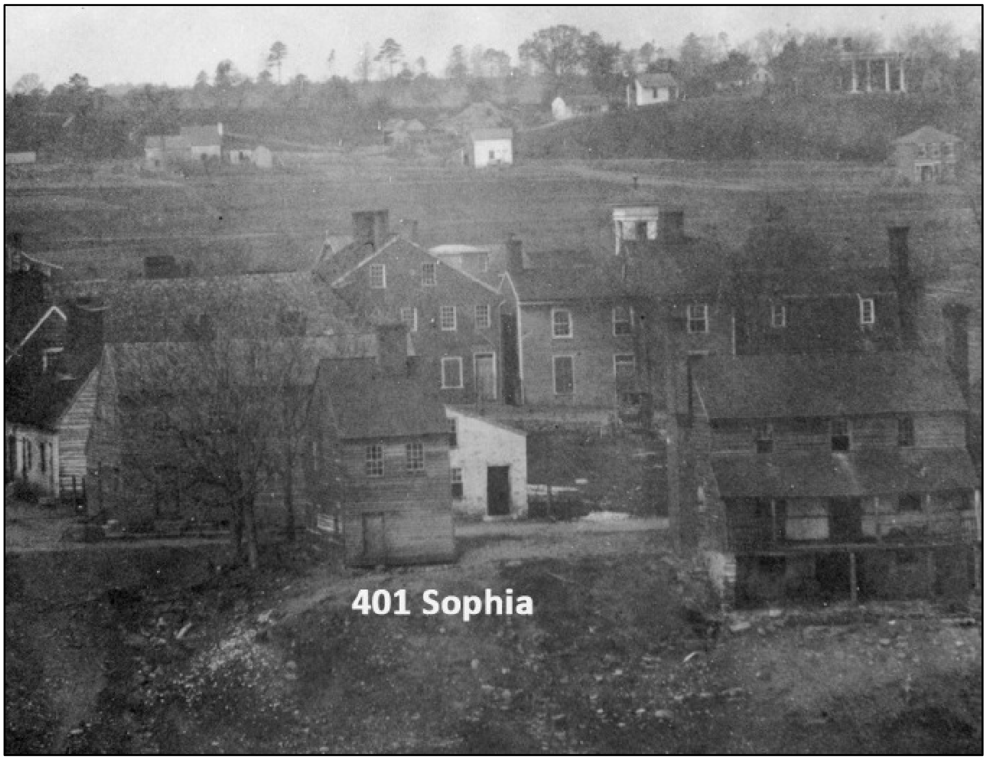

FIGURE 3-26: THE REAR OF THE HOUSE AT WHAT WAS THEN KNOWN AS 401 SOPHIA STREET DURING THE CIVIL WAR (NATIONAL PARK SERVICE [NPS] 2015). THE ORIGINAL HOUSE ON THE LOT WITH THE REAR SHED-ROOFED ADDITION (CA. 1815) CAN BE SEEN TO THE RIGHT.

The first owners to occupy the home at 401 Sophia Street were the Jenkins family. Alexander and Mary Jenkins bought the home in November 1887 (Figure 3-27) (CFDB BB:417). Numerous small dwellings along Sophia Street were owned and occupied by members of the Jenkins family in the late-nineteenth through early-twentieth century. A working-class family, members of the clan were employed throughout Fredericksburg, at the Eagle Shoe Company on Lafayette Street, at the Excelsior Plant on Sophia Street, and by the RF&P Railroad (Barile 2009:6–13). In fact, members of the Jenkins family owned approximately one-third of all dwellings on lower Sophia Street after the war. During their ownership of 401 Sophia Street, Alexander and Mary Jenkins granted a right-of-way easement to the RF&P for the construction of a rail spur from the main line north of their home to a warehouse located south of their house along Sophia Street (Figure 3-28) (CFDB OO:500). The line would have snaked along the north side of their home and immediately behind their back door (Figure 3-29). It was never built. The Jenkins family eventually sold the lot, and it passed through several owners. In the 1920s, it was owned by the Refractory Products Corporation and the Quigley Furnace Specialty Company who, at times, operated a factory across the street. The dwelling was used as worker housing, and it was the subject of a WPA report in 1938 (Figure 3-30).

FIGURE 3-29: CIRCA 1913 PLAT SHOWING THE PROPOSED RF&P RAIL SPUR SNAKING AROUND THE HOUSE AT 401 SOPHIA STREET (CFDB OO:500)

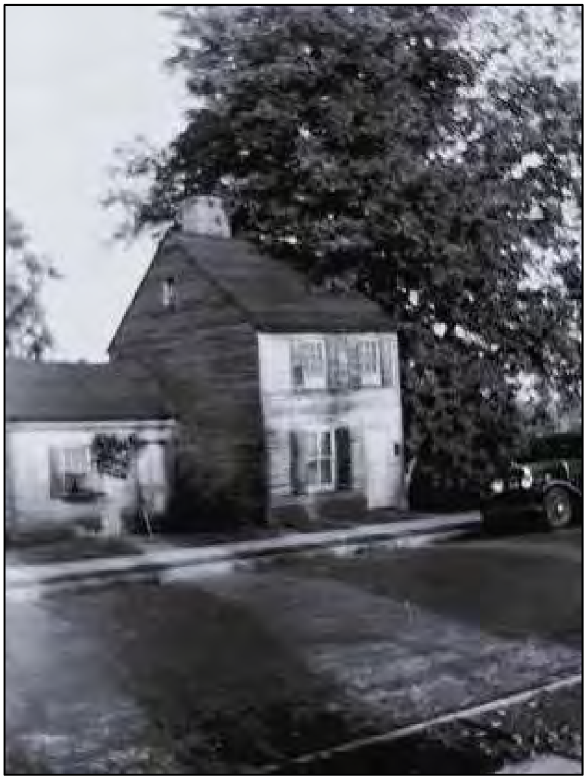

FIGURE 3-30: THE HOUSE AT 401 SOPHIA STREET CAPTURED IN 1938 DURING THE WPA PROJECT (WPA 1938). THE HOME WAS CALLED THE "EARLY MAYOR'S HOUSE" AT THIS TIME AS IT WAS MISTAKENLY BELIEVED THAT THE HOME WAS OCCUPIED BY JAMES SOMERVILLE IN THE LATE-EIGHTEENTH CENTURY.

In 1948, the house was purchased by Mennis and Virginia Gibson. They enlarged the home through an addition on the north side of the dwelling that mirrored the original home in scale and massing, constructed in the 1950s (it was at this time that the address was expanded from 401 Sophia Street to 401–403 Sophia Street). They lived in the home until Mennis's death in 1976 (CFWB R:598). Virginia remained in the house until 1984 when it was sold to Herbert and Courtney Pelley (CFDB 188:95). The home was owned and occupied by the Pelley's until 1997 when the house was sold to UCK, LLC, who rented the dwelling (CFDB 305:625). It remained unoccupied from 2012 until it was demolished in August 2015.

3.3.2 Architectural Description

The Dixon House at 401–403 Sophia Street was a two-story, four-bay dwelling built with no discernable style (Figure 3-31). The southern half (southern two bays) was the original core, built around 1843 (Figure 3-32). The northern half (northern two bays) was a later addition, added in the 1950s by the Gibson family. A description of the property can be found in the 2015 survey (Staton and Lesiuk 2015). The dwelling was demolished on August 27 and 28, 2015 at the request of the owner, UCK, LLC. Because of its age and its rarity as an Antebellum-aged structure along lower Sophia Street, numerous photographs were taken during the demolition process (Figure 3-33). An inspection of the photos shows that the wood framing was hand hewn and the structural system was fastened with cut nails with cut heads, emblematic of the period of construction (Figure 3-34). Today, the lot is covered in manicured grass; no above-ground elements remain of the once-extant building (Figure 3-35).

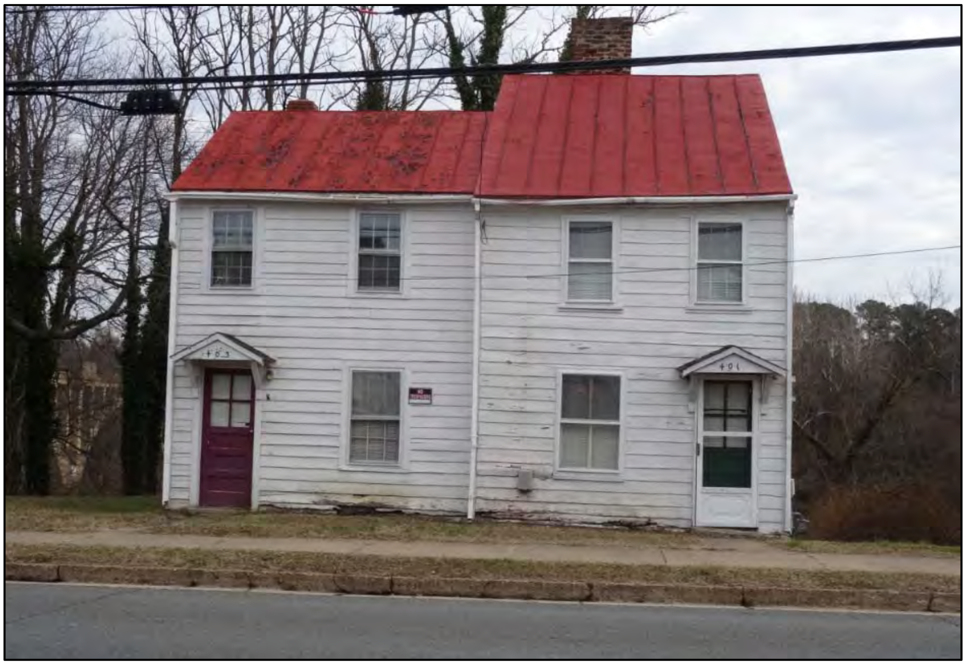

FIGURE 3-31: PRIMARY (WEST) ELEVATION OF THE HOUSE AS PHOTOGRAPHED IN THE SUMMER OF 2015 JUST BEFORE DEMOLITION

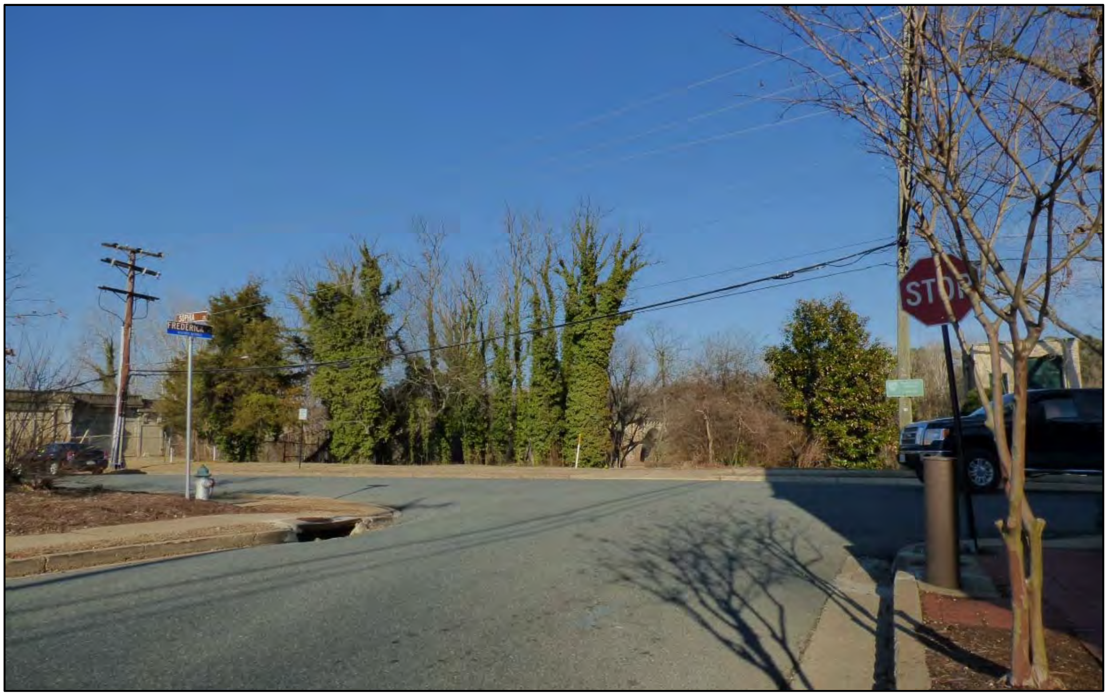

FIGURE 3-35: FORMER LOCATION OF THE DIXON HOUSE, LOOKING EAST FROM THE INTERSECTION OF SOPHIA AND FREDERICK STREETS

3.3.3 NRHP Evaluation

The Dixon House at 401–403 Sophia Street was the sole surviving antebellum structure on a streetscape that was the scene of incredible destruction during the Civil War and, architecturally, retained many character-defining features. However, the building was demolished in August 2015. As such, the resource at 401–403 Sophia Street is recommended not eligible for the NRHP under Criteria A–C. It was not evaluated under Criterion D; however, photographs taken of the demolition show notable subsurface disturbances completed during the demolition process. The probability for encountering intact, significant archaeological deposits is low. In sum, the Dixon House is **recommended not eligible for listing in the NRHP under Criteria A–C.** As the resource has been demolished, it is recommended non-contributing to the eligibility of the Fredericksburg Historic District (111-0132).

3.4 FREDERICKSBURG TRAIN STATION (111-0132-0704)

The Fredericksburg Train Station is located at 200 Lafayette Boulevard in downtown Fredericksburg (Figure 3-36). The primary resource faces north on Lafayette, and the lot is bounded by Princess Anne Street on the west, Frederick Street on the south, and Caroline Street on the east.

During the 2015 DC2RVA rail identification-level survey, the boundaries for this resource were restricted to the parcel on which the main train building sits (Parcel Number 7789-23-2444) (Staton and Lesiuk 2015). However, during the current intensive-level study, the DC2RVA Team determined that there are additional resources associated with the Fredericksburg Train Station located beyond the parcel boundaries, including a passenger waiting station, passenger platform, and elevator tower. As such, as part of the current survey, the Team expanded the resource boundaries to include these secondary resources; the Fredericksburg Train Station boundaries now comprise Parcel Numbers 7789-23-2444 and 7789-23-3302 and the CSXT right-of-way that separates these two parcels.

3.4.1 Historic Context

Although not the first rail system established in Virginia, the RF&P was certainly one of the most influential. Chartered in 1834, the 113-mile line opened in 1836 with the original segment running from Richmond to Hazel Run just south of the limits of Fredericksburg (Griffin 1994:4–5). The line into town was opened six months later. On January 23, 1837, the first passenger train stopped in Fredericksburg, ushering in a new age of transportation (Griffin 1994:5; HFFI 2014:26). This was the temporary end-of-the-line for the RF&P, as the route north of Fredericksburg was not completed for five years. The line to the north was finally opened in 1842, bringing travelers not to Washington, D.C., but to Aquia Landing, where they would board steam ships that would carry them the rest of the way. A continual rail line between Richmond and Washington was not completed until 1872 (Griffin 1994:5).

Location Of The Fredericksburg Train Station (111-0132-0704)

02/2018

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_Phil.mxd | Last Updated: 02.19.2018

The history of the Fredericksburg station itself somewhat mirrors the piecemealed history of the rail line. Originally, the alignment of the rail track was to run through the center of town. Lots along Charlotte Street were purchased between 1834 and 1836 as the future location of the rail bed (Barile et al. 2008). As plans progressed, it was determined that a course through the southern part of town would be advantageous from an engineering and property perspective, and the current alignment was chosen in 1836. Five lots were purchased by the RF&P Railroad Company along what is today Lafayette Boulevard for the construction of the railroad track, sidings, and a wheel house (CFDB K:200). Although trains stopped in town, Fredericksburg originally did not have a depot. Passengers waited on an open platform, but no shelter for people or goods was provided. Numerous letters to the editor of the *Fredericksburg News* (1850) lamented the absence of a station: "Would it not be as well for the company to expend some of their proceeds in erecting suitable buildings on their now barren lots in this place. — It presents a bad appearance to strangers passing through our town." In response, a small, one-story, wood-framed structure was eventually built in the mid-1850s to function as an anchor to the train service in this area. Rail traffic was soon disrupted, though, by one of the most significant events in our nation: the Civil War.

Located half way between the U.S. capital in Washington, D.C. and the Confederate capital in Richmond, Fredericksburg was the site of repeated fighting and occupation. The rail line connecting the two capitals was often the focus of the conflict. The rail bridge over the Rappahannock River was burned early in the war, and rail traffic ceased (Marvel 1995:5; O'Reilly 2006:8). Numerous Civil War images highlight the remains of the rail tracks on the south side of the Rappahannock River—a symbol of war's destruction (Figure 3-37). Rail traffic was not fully restored until after 1870. Passengers continued to use the small depot built in the 1850s to purchase tickets and wait for arriving trains.

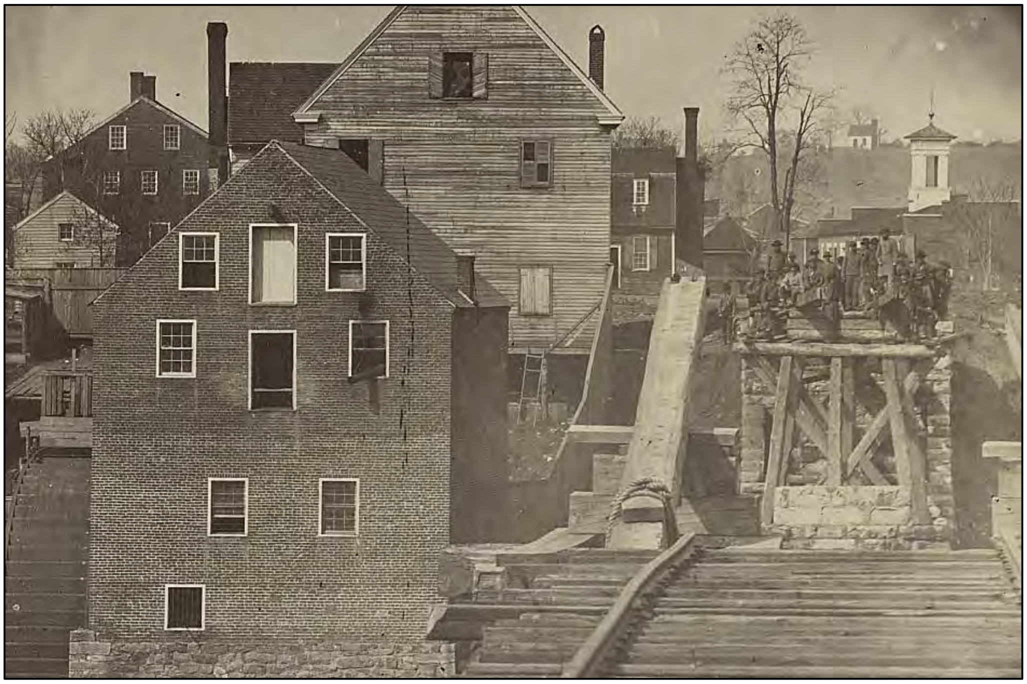

FIGURE 3-37: CIVIL WAR SOLDIERS SIT ON THE END OF THE RAIL TRACKS IN FREDERICKSBURG CIRCA 1863 (LOC 1863). THE BRIDGE CONNECTING THE TRACKS TO STAFFORD COUNTY TO THE EAST WERE BURNED EARLY IN THE WAR.

By the 1880s, economic and social prosperity had improved in this area, and traffic along the RF&P increased substantially. The increase in rail travel once again caused Fredericksburg residents to clamor for a new station to replace the older depot. The RF&P relented, and a new station was erected in 1888. The new station was "a very decided improvement, and adds much to the comfort of visitors and the travelling public. It is quite an ornament to the city" (Fredericksburg Star 1888). This new building was a one-story, timber-frame structure with a hipped roof and prominent cross gable featuring decorative bargeboard (Figure 3-38). A long, covered platform was parallel to the at-grade rail tracks. The station was a success for decades, but its location at the bend of the tracks and its material composition led to repeated damage. For example, in June 1896, the roof was blown off of the station building during a powerful storm, making the building unusable for months (Fredericksburg Free Lance 1896).

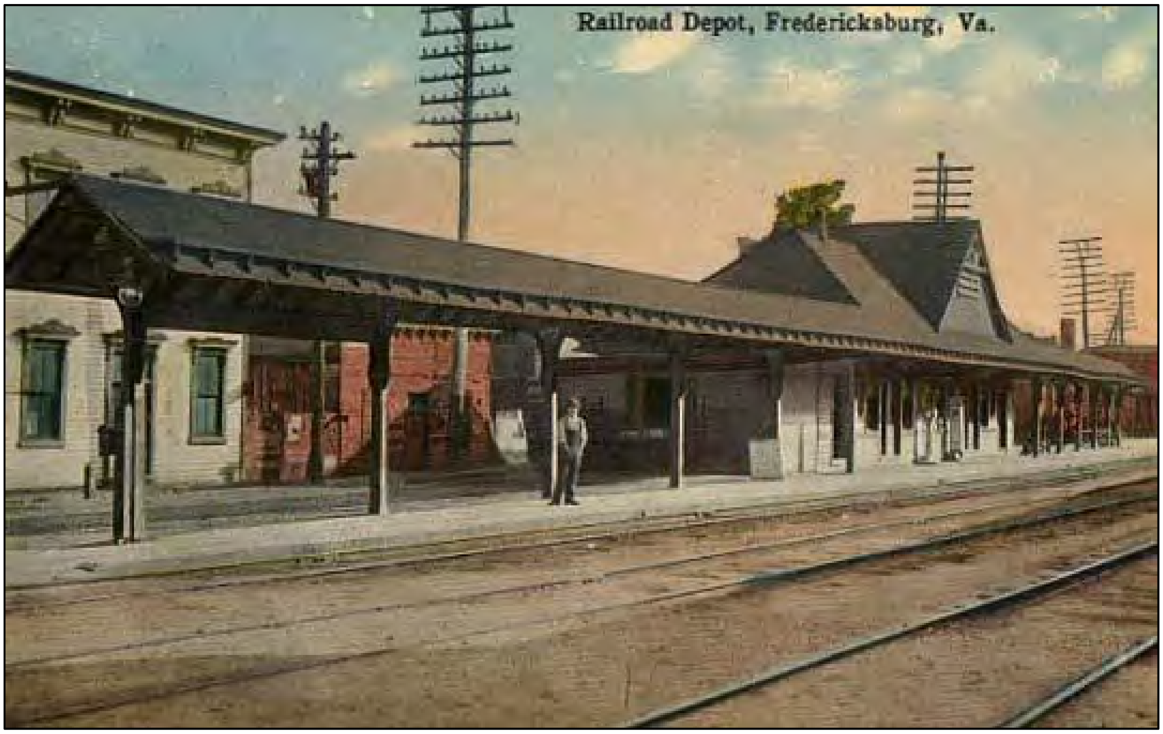

FIGURE 3-38: CIRCA 1888 FREDERICKSBURG TRAIN STATION (TRAINWEB 1905)

Seeking yet another solution to their station issues, Fredericksburg City Council began to petition the RF&P for a new building in 1909. A new site for a station was selected east of the old site (Figure 3-39). For the first time, the train station was to be located to the north of the extant tracks, closer to the core of commercial development. Local builder E.G. "Peck" Heflin was selected to complete the project (Fredericksburg Free Lance-Star 1941). Using tenants of the relatively new (to Fredericksburg) Colonial Revival style, Heflin designed a capacious and grand station to mirror elements of Fredericksburg's colonial past (Figure 3-40). When it opened in 1910, the new $125,000 building was described as "one of the handsomest and best equipped stations in the State" (Fredericksburg Daily Star 1910). The new station was decorated with chestnut accents and terrazzo floors, and the interior was lit through both electric and gas lighting. Although not integrated, the new station served all of Fredericksburg's residents through the use of separate, fully equipped "white" and "colored" waiting rooms and separate bathroom facilities.

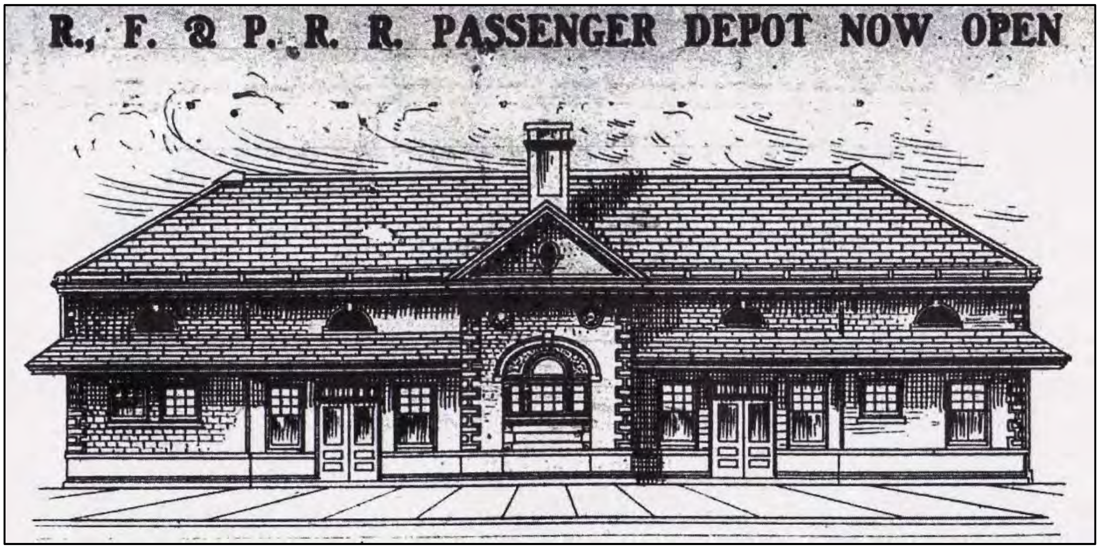
FIGURE 3-39: LOCATION OF THE 1850S AND LATER 1888 DEPOT (CIRCLED IN RED) IN RELATION TO THE CIRCA 1910 FREDERICKSBURG TRAIN STATION LOCATION (CIRCLED IN GREEN) AS SHOWN ON AN 1890 CITY MAP (FREDERICKSBURGVA 1890)



R., F. & P. R. R. PASSENGER DEPOT NOW OPEN

FIGURE 3-40: NEW STATION AS IT APPEARED AT ITS OPENING IN NOVEMBER 1910 (FREDERICKSBURG DAILY STAR 1910)

The new station served the city well but the dramatic increase in rail and road traffic during World War I and the pre-depression years led to numerous accidents and incidents along the at-grade tracks through town. It was determined that a raised system of rail tracks would expedite rail service and provide a safer environment for residents. A temporary station and rudimentary set of tracks were built on the south side of the existing rails to provide continuous coverage for rail passengers during the multi-year project, which cost well over $1 million (Fredericksburg Free Lance-Star 1927).

The raising of the tracks was achieved through both the creation of a superstructure to increase the height of the tracks themselves as well as lowering the level of the streets near the tracks and the station by several feet (Figure 3-41). Together, these elements allowed for vehicles to traverse under the tracks and for longer trains to stop at the station unimpeded by auto traffic. In addition, several improvements were made to help facilitate loading and unloading of both travelers and goods at the station during the construction (Figure 3-42). Two wings were appended to the original building to increase the size of the 1910 station, a new shelter was built on the south side of the tracks to protect those waiting for northbound trains, and an elevator was erected to help move goods up to the new elevated platform (Sanborn Map Company 1912, 1919, 1927). A large, cast, concrete ramp with Colonial Revival balustrade was built at this time along the primary elevation to allow pedestrians to access the station easily from the now-lower Lafayette Boulevard in front of the station.

Rail continued to be a primary method of travel in Fredericksburg through the 1930s and during World War II when record numbers of soldiers and travelers used the RF&P to traverse the country (Pierce 1987). In 1956, the Federal-Aid Highway Act led to the creation of a national system of interstates connecting cities and towns across America, including Interstate 95 (I-95). The personal automobile quickly became the transportation method of choice, and the railroads saw a notable decline in ridership. This steady decrease in passenger service continued in the 1960s and 1970s. The circa-1910 station was disused in 1976 and sat empty for many years (Pierce 1987). It was not until the late 1980s when it was finally resurrected as a restaurant. Interestingly, the RF&P Company retained ownership of the station until 1996 (CFDB 297:277). It is likely due to this continued rail ownership that the station underwent very few changes as it transformed from a rail depot to a commercial venue.

Rail traffic at the Fredericksburg station began to increase again in the early 1990s—not due to a renewed interest in train travel per se, but through the development of commuter rail. The arrival of the VRE in 1992 brought a revived vigor to the train station (Fredericksburg Free Lance-Star 1992). Today, the Fredericksburg Train Station building and the secondary elements associated with continued rail traffic are at the heart of a vibrant and active part of town.

3.4.2 Architectural Description

3.4.2.1 Primary Resource Exterior

The Fredericksburg Train Station is a rectilinear, two-story, five-bay, brick building constructed in the Georgian Revival style circa 1910. Measuring roughly 135 feet by 26 feet, the station rests on a raised foundation that is hidden by the surrounding poured-concrete platform (Figure 3-43–Figure 3-45). The brick walls of the building are laid in a Flemish bond pattern featuring hard-fired, or blackened, headers. The base of the building is decorated with a molded brick and cast stone water table as well as beveled brick quoins at the corners.

The main massing is covered by a hipped asphalt-shingled roof lined by a wood cornice with heavy modillions and pierced by a single, central-interior, corbelled, brick chimney. At the center of the north and south elevations is a two-story, projecting, gabled bay that contains a Palladian window at the lower level and two pre-cast stones featuring the numbers "19" and "10" at the upper level with a pediment above. Appended later, at the same time as the reconstruction of the Rappahannock River Bridge circa 1927, two one-story wings flank the station on both the east and west sides (Figure 3-46). These wings are covered by a low-pitched roof lined by a pre-cast concrete balustrade. A hipped, asphalt-shingled skirt wraps around each wing and a portion of the north elevation of the station building to create wide overhanging eaves. On the south elevation, this skirt has been removed from the main massing and replaced by a wide band of stucco.

Two double-leafed entries are located on the north elevation, each flanking the central projecting bay. Both are filled with a set of half-glazed wood doors topped by a five-light, wood-framed transom window. One set of wood double-leafed doors and a paneled wood door are located on the west elevation. All of the doors at the station building do not appear to be original. The windows, however, do appear to be original to the construction of the building and comprise nine-over-one, double-hung, wood-sash windows topped by splayed jack arches and a central pre-cast keystone. Filling the projecting central bay on both the north and south elevations is a Palladian window featuring fluted pilasters and a pebble-dashed stucco (Figure 3-47). At the upper level, a series of wood-framed fanlights with pre-cast stone sills and keystones are exhibited. Windows in both wings are largely nine-light, wood-framed, pivot sashes with pre-cast sills, splayed jack arches, and pre-cast keystones.

3.4.2.2 Primary Resource Interior

On the interior, the spatial organization of the train station remains largely intact even though the space was converted into a restaurant in the 1990s. Originally, the main massing consisted of open waiting rooms on either side of two smaller central spaces that historically served as the ticket office and "colored" restrooms. Today, the "white" waiting room remains open and retains its finely dressed stone walls, intricate woodwork, and arched plaster ceiling. The "colored" waiting room is largely open, but now contains a long bar and the hostess waiting area. What was the ticket office is now a private dining room, which has maintained its unique hexagonal wall configuration and large windows for viewing train traffic. The original "colored" restrooms appear to have been reworked into storage spaces.

Historically, the east wing was equally divided into "white" restrooms for both men and women, but this wing, in particular, was gutted during the latest renovation and is now one large dining space (Figure 3-48). This is the one interior area that has not retained its integrity. The west wing originally functioned as a baggage area but now serves as a kitchen and storage area for the restaurant. The general configuration and flow of this space has been maintained.

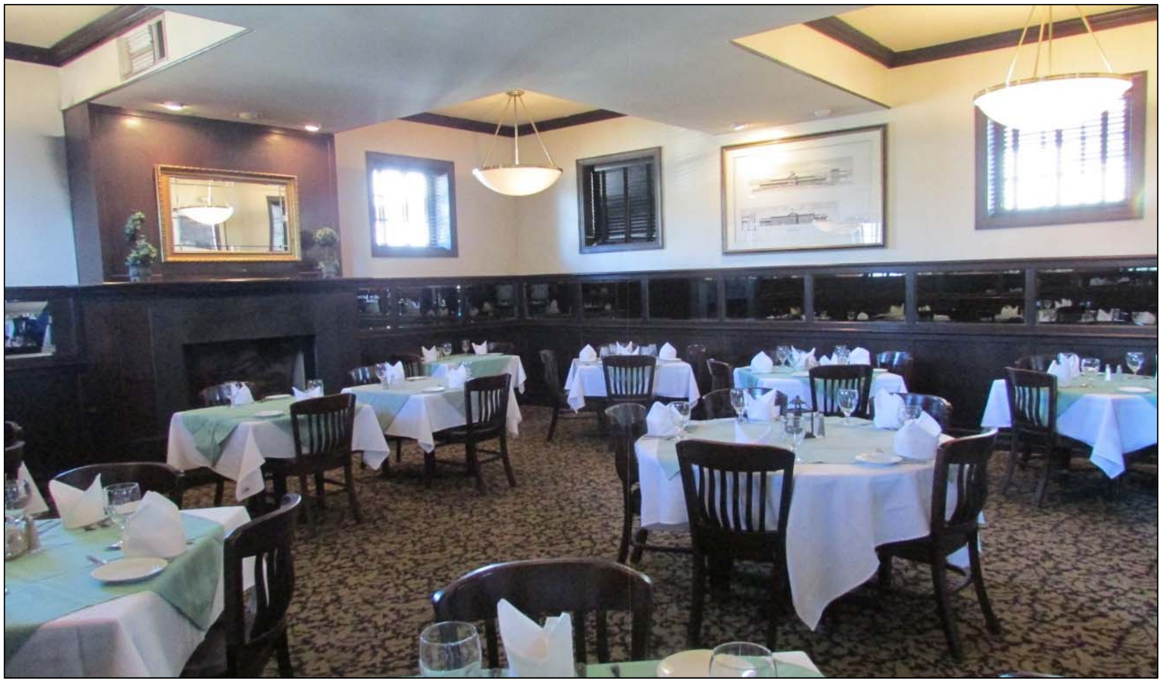

FIGURE 3-48: VIEW OF DINING ROOM, LOOKING EAST

3.4.2.3 Secondary Resources

Four secondary resources are associated with this property. A two-story freight tower lift was built circa 1927 when the station and platform were raised to eliminate at-grade street crossings (Figure 3-49). The tower construction utilized the same materials as the station building additions. It likely rests on a poured concrete foundation and has a masonry structural system clad in a Flemish-bonded brick featuring brick quoins. It is covered by a low-pitched roof lined with a pre-cast concrete cornice and topped with a concrete balustrade. In recent decades, this tower has been rehabilitated to include an elevator for accessing the station platform. At this time, fixed metal-framed windows were added to allow natural light into this structure.

A concrete platform surrounds both the station building and elevated railroad tracks. This structure is made of reinforced poured concrete and dates from the circa-1927 expansion of the station and is lined by the same pre-cast concrete balustrade and railing used throughout the station. A passenger waiting station was also constructed opposite the station building in 1927 (Figure 3-49). It is a single-room structure with a poured-concrete foundation and structural system that is covered by a low-pitched roof lined with the station's ubiquitous concrete balustrade. Two single-leaf entries are located on the north elevation facing the tracks on either side of a central, fixed, multi-pane window. This waiting station is still in use as a rail waiting area today.

A circa-1995 metal canopy shelters the area on both sides of the railroad tracks where passengers get on and off the trains (Figure 3-50). At the north side, the canopy extends to the freight tower on the west end, and at the south side the canopy envelopes the waiting station and extends to a circa-1995 elevator tower at the east end of the platform.

A modern elevator tower, constructed circa 1995, is located at the southeast corner of the modern metal canopy on the south side of the railroad tracks. It was built to match the older station building in material and design, featuring a poured-concrete foundation and structural system topped with a low-pitched roof.

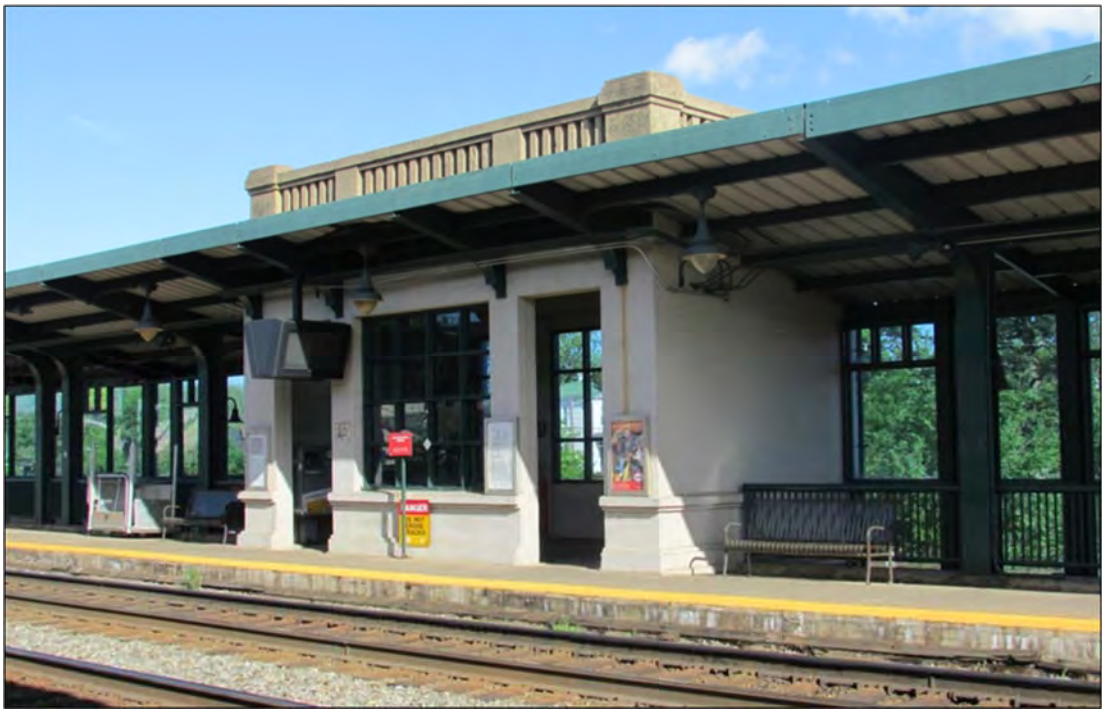

FIGURE 3-50: NORTHWEST OBLIQUE OF PASSENGER WAITING STATION

3.4.3 NRHP Evaluation

Rail travel has been a mainstay of Fredericksburg since the first train arrived in January 1837. In fact, the extant Fredericksburg Train Station is the third station in the city. A small depot was built in the 1850s and this building was replaced in 1888 by a larger structure. The high demand for passenger and freight services caused this station to be demolished in 1910 and replaced by the current Georgian Revival-styled building. The station and surrounding tracks were modified in 1927 to accommodate raised facilities, and rail continued to be a central part of Fredericksburg life until the construction of nearby I-95 in the late 1950s, when the personal automobile overtook the train as the preferred mode of interstate transportation. Interest in the rail was revived in 1992 when the VRE was established.

The Fredericksburg Train Station is the most prominent surviving symbol of the importance of rail travel to the community, and visitors from across the nation stepped through the station's doors. It directly reflects historical trends ranging from the dichotomy of the train and the automobile in the early-twentieth century to the presence of Southern racial segregation in the pre-Civil Rights era. It is recommended that this resource is eligible for the NRHP under Criterion A for its significant associations with transportation, community planning, and development in Fredericksburg at the local, state, and national level.

Although the Fredericksburg Train Station was built by one of Fredericksburg's most notable designers, Peck Heflin, NRHP guidelines state that resources associated with architects, artisans, artists, or engineers solely due to their involvement in the design should be noted under Criterion C rather than Criterion B. For a resource to be eligible under B, it has to have had a long-term, profound effect on their work, such as a studio or a home. While the train station is a very important piece of Heflin's work and represents a key moment in his design evolution, the association is project specific. There is also no connection between this resource and any other notable individual. As such, it is recommended that this property is not eligible under Criterion B.

The Fredericksburg Train Station is an excellent example of Georgian Revival architecture in the community. The building's symmetry, Flemish-bonded brick structural system, hipped roof, quoins, and other decorative elements such as keystones, fanlights, and stone lintels clearly demonstrate the influence of Georgian architectural trends on earlier examples of the Colonial Revival style. Furthermore, the building is a notable part of how the City's designers embraced their Colonial heritage in the first decades of the twentieth century. Though the main station building is now used as a restaurant, the interior spaces and the vast majority of the architectural elements were maintained during the conversion to commercial use. Moreover, the secondary elements that surround the station, including the tracks, platform, waiting station, and elevators, are all still used for rail travel.

In comparing this station to other rail buildings in Virginia, there are 21 stations that have been determined to be eligible for the NRHP. Of these, only four were designed in the Colonial Revival style: the Alexandria Station (100-0124), the Orange Station (275-0022), the Williamsburg Station (137-0250), and the private station at the DuPont Spruance plant south of Richmond (020-5474). The Fredericksburg Train Station is a direct comparison to the Alexandria Station, which is listed on the NRHP. Both are brick stations built in the first decade of the twentieth century in urban environments to service a growing clientele. Both include high-style architectural elements on the exterior and both retain many of their original architectural elements and historic space uses. On the interior, the Fredericksburg station also retains its high-styled decorative elements such as terrazzo floors and chestnut woodwork.

In addition to being an exceptional individual example of Georgian Revival architecture with excellent integrity, the Fredericksburg Train Station is also significant as the work of Fredericksburg's most prominent twentieth-century architect, E.G. "Peck" Heflin. Heflin dropped out of school at the age of 15 to work as a carpenter. From these humble beginnings, he went on to design and construct the city's most notable buildings in the first half of the twentieth century. The train station was one of his earliest forays into high-style Colonial Revival design, more particularly as it was influenced by Georgian architecture in Virginia. After the success here, he went on to design and build Lafayette School (now the Central Rappahannock Regional Library), the Princess Anne Hotel, the Stratford Hotel (now the George Washington Executive Center), the old Mary Washington hospital, several buildings on the campus of what is now the University of Mary Washington, and dozens more. In addition to his success as a commercial designer, he also crafted hundreds of private residences, many in variations of the Colonial Revival style. The importance and prevalence of his work, and the Colonial Revival style in general, to Fredericksburg is reflected in the Fredericksburg Historic District's (111-0132) NRHP nomination update written in 1984, which was specifically appended to the original 1972 nomination to include buildings designed in the Colonial Revival style. Many of these were designed by Heflin, and the train station was one of the catalysts for this design trend. Given its exceptional integrity of location, design, setting, feeling, association, workmanship and materials, as well as its importance as an early Colonial Revival building designed by Peck Heflin, it is recommended that the Fredericksburg Train Station is eligible for the NRHP under Criterion C. As an architectural resource, the property was not evaluated under Criterion D. In sum, the Fredericksburg Train Station is **recommended as individually eligible under Criteria A and C and is a contributing element to the Fredericksburg Historic District (111-0132).**

The proposed NRHP boundary for the Fredericksburg Train Station at 200 Lafayette Boulevard follows the legal lot description for two parcels in their entirety (Parcel Numbers 7789-23-2444 and 7789-23-3302) as well as the CSXT-owned railroad tracks that separate the two parcels (Figure 3-51). It is bounded on the north by Lafayette Boulevard, on the west by Princess Street, on the south by a series of parcels (Parcel Numbers 7789-23-3296, 7789-23-2199, and, 7789-23-2233), and on the east by Caroline Street. The proposed boundaries include the train station, passenger waiting station, two-story freight tower lift, concrete platform, metal canopy, elevator tower, small parking areas and poured-concrete sidewalks. The period of significance for the Fredericksburg Train Station begins with its construction date in 1910. Because it continues to be associated with railroad traffic in Fredericksburg, the DC2RVA Team applied the NPS 50-year-rule for defining periods of significance for resources "where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997). As such, the period of significance spans from 1910 to 1968.

3.5 PURINA TOWER COMPLEX (111-0132-0020)

The industrial building complex at 401–403 Charles Street, known locally as the Purina Tower Complex (111-0132-0020), is located within the boundaries of the Fredericksburg Historic District (111-0132) in the City of Fredericksburg, Virginia, along the western bank of the Rappahannock River. The building occupies a 0.36-acre parcel on the northwest corner of the intersection of Frederick and Charles Streets, just south of the CSXT elevated railroad tracks in the city's downtown district (Figure 3-52).

The areas to the immediate north, east, and west of the property are largely industrial in character, embodied in the CSXT railroad tracks and train station, several late-nineteenth and early-twentieth-century warehouses, and the city's one-time gas plant building. The areas to the south and southeast are primarily residential, populated by single-family homes of varying size and style dating from the late nineteenth-century through the present.

3.5.1 Historic Context

The parcels presently associated with 401–403 Charles Street were part of a larger, 330-acre tract purchased by Roger Dixon shortly after his arrival in Fredericksburg in 1749. More specifically, the present-day property was part of lot 220 on block 60, platted by Dixon in 1752. As shown on the map in the figure below (Figure 3-53), the northern boundary of his land extended at an angle through block 60 and a portion of lot 220. Interest in Dixon's real estate venture was slow to manifest. Though he had sold 33 of the platted lots by the early 1760s, few had been improved in any substantial way (Loyd n.d.). Lot 220 was sold in 1765 (CFDB F:694).

The first reference to any standing structures on lot 220 appears in 1834, when the property's then-owner, John Metcalf, paid fees on a building valued at $100.00 (Stanton 2013). A dwelling is noted in the 1886 Sanborn Fire Insurance map at the northeast corner of Frederick and Charles Streets (Figure 3-54) (Sanborn Map Company 1886). In 1909, the estate of Thomas Griffin was charged a fee on a portion of lot 220 valued at $200.00 and a building—presumably the dwelling on the southwest corner of the parcel—assessed at $50.00. The house was apparently demolished shortly thereafter as the following year's tax rolls list no structure and a note appearing in the page margin read, "small building off" (Stanton 2013). Five years later, in 1914, the heirs of Thomas Griffin (dec.) sold the 30 by 165-foot property along the west side of lot 22, to local businessmen, Edgar M. Young and Houston K. Sweetser (CFDB 48:545).

The new owners were partners in "a feed and grain concern" known as the Young-Sweetser Company (Fredericksburg Free Lance-Star 1961). The enterprise had been established two years prior, and the pair were looking to expand. In 1915, they enlarged their existing 30 foot by 165 foot site (Parcel 1) through two additional acquisitions. The first, an east-adjoining, 78 foot by 104 foot property (Parcel 2), was purchased from the RF&P Railroad (CFDB 49:11). As part of the deal the railroad received a 30 foot by 68.5 foot section excised from the north end of the parcel acquired from the Griffin estate the year before. The second (Parcel 3) was another east-adjoining, 43 foot by 104 foot lot (CFDB 49:94). The approximate boundaries of the three acquired properties are shown on the 1919 Sanborn map (Figure 3-55) (Sanborn Map Company 1919). Also visible on the 1919 map is a new warehouse building, which according to land tax records, was likely constructed around 1916, and a new rail spur line extending along the north edge of the property (Stanton 2013). By 1920, this building had either been replaced by, or incorporated into, a new, larger warehouse and a six-story, concrete grain elevator appended to the northwest corner. An advertisement for the Young-Sweetser Company appearing in the 1921 Fredericksburg City Directory specifically noted the "new concrete elevator and warehouse" (Fredericksburg City Directory 1921). The new facility is visible on the 1927 Sanborn map below (Figure 3-56). Also shown are a square-shaped, one-story, frame addition at the south end of the warehouse's west elevation, a frame canopy along the west elevation of the grain elevator, and a rectangular clerestory centered on the main block's roof.

The grain elevator, built by the Deverell-Spencer Co. of Baltimore, Maryland, was erected on a concrete slab using a slip-form method (Heverin 1997). The slip-form method utilizes formwork raised vertically in a continuous process to extrude a reinforced concrete section that is suitable for construction of high-rise structures, such as towers (MPA 2018). The finished structure stood 88 feet tall with a storage capacity of 20,000 bushels of grain. It was built on a "unit plan" that could be expanded by simply appending additional silo bins. Grain was transported by train car using the rail spur, by river barges, and by truck to one of two loading doors on the Charles Street side and north elevation of the tower. The facility was outfitted with the latest machinery for cleaning, weighing, distributing, elevating, and storing the grain. "Nothing so voluably typifies progress as to view the big concrete grain elevator of the Young-Sweetser Co. here and compare it with conditions in olden times for handling and keeping grain crops" (Fredericksburg Daily Star 1919; Fredericksburg Free Lance-Star 1922). Reportedly the only "large elevator between Richmond and Washington," it had an immediate impact, helping connect area farmers with a larger market for their products (Fredericksburg Free Lance 1922). As seen in a 1930s photograph, the rail siding ran along the north side of the building where grain could be loaded and unloaded from cars through a door on the north side of the elevator (Figure 3-57).

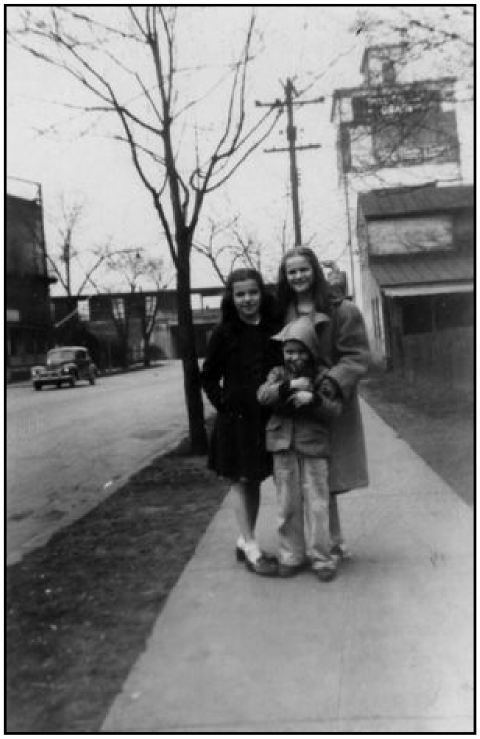

FIGURE 3-57: HALL FAMILY WALKING TO CHURCH ON LAFAYETTE BOULEVARD IN 1949. PURINA TOWER VISIBLE IN THE BACKGROUND TO THE RIGHT. (STROBEL 2015)

The Young-Sweetser Company's business continued to thrive until the mid-century; however, in the 1950s things changed as the enterprise faced increasing competition from other local grain companies like Germania Mills and Roxbury Mills, which, by then, had also constructed large-volume elevators. The operation continued, supported mainly by smaller volume customers, and focus gradually shifted from bulk grain shipments to more "specialized feeds and prepared mixtures" (Figure 3-58) (May 1987:6). In 1961, the company's remaining founder, H. K. Sweetser, passed away (Edgar M. Young had died in 1944). The business continued for another two decades under the direction of his widow, Mary Sweetser, who had joined the board of directors in the 1930s, and their son, Robert Moore. In 1981 however, following the deaths of Mary Sweetser and Robert Moore, the company was sold and the tenure of the Young and Sweetser families ended (May 1987:4-8).

The new owner, the Farm and Tack Supply Company, Inc., which had been operating out of the facility since 1966, was owned by the Redgrave family. The Young-Sweetser Company's feed business continued, but the product line had been expanded to include horse tack, pet supplies, and leather goods. The elevator remained in operation for another five years, but by 1986, the interior machinery had become too outdated and was shut down for good (May 1987:6). The Farm and Tack Supply Company remained in business until 1992 and two years later (1994), the 401 Charles Street property was sold to an LLC (Prime Properties, LLC) whose principal had plans to adapt the warehouse and elevator for use as a health club (Amrhine 2001; CFDB 275:467). Those plans failed to manifest, and five years later (1999) the site was acquired by its current owner, Hamilton Palmer (CFDB 330:500).

In the early 2000s, a portion of the warehouse interior was reconfigured to provide office and meeting spaces, and a rehabilitation of the facility was completed. The rehabilitiation work included repairs to the exterior concrete walls of the grain elevator. An open area along the east side of the warehouse was paved for parking and the tower's familiar checkerboard paint scheme was refreshed around this time as well. The original checkerboard paint scheme had reportedly been paid for by one of Young-Sweetser's largest clients, the Purina Company, as an advertisement likely sometime after the 1950s (Amrhine 2001; May 1987:6; Staley 2005:4).

3.5.2 Architectural Description

3.5.2.1 Primary Resource Exterior

The industrial building complex at 401–403 Charles Street, known as the Purina Tower Complex, is located on the southwest corner of the Charles and Frederick Streets intersection on a lot approximately 0.36 acres in area and roughly 104 by 150 feet in dimension (Figure 3-59). The facility, which includes a large, one-and-a-half-story, warehouse main block and a six-story, concrete, grain elevator appended to its northwest corner, sits slightly set back from Frederick Street on the south and Charles Street on the east with its primary elevation facing south. Paved parking areas border the north, south, and east sides of the building, and a paved driveway extends in a north-south direction along the west elevation. Landscaping is limited to several modestly sized trees planted in the east-side parking area, along the sidewalk on the west side of the structure, and adjacent to the side entrance centered on the building's west elevation. Manicured shrubs also line portions of the west and east elevations. The latter screen a gas meter and its associated piping installed along the foundation. A vertical-plank wood fence extends eastward from the northeast corner of the building along the north side of the east-adjoining parking area (Figure 3-60).

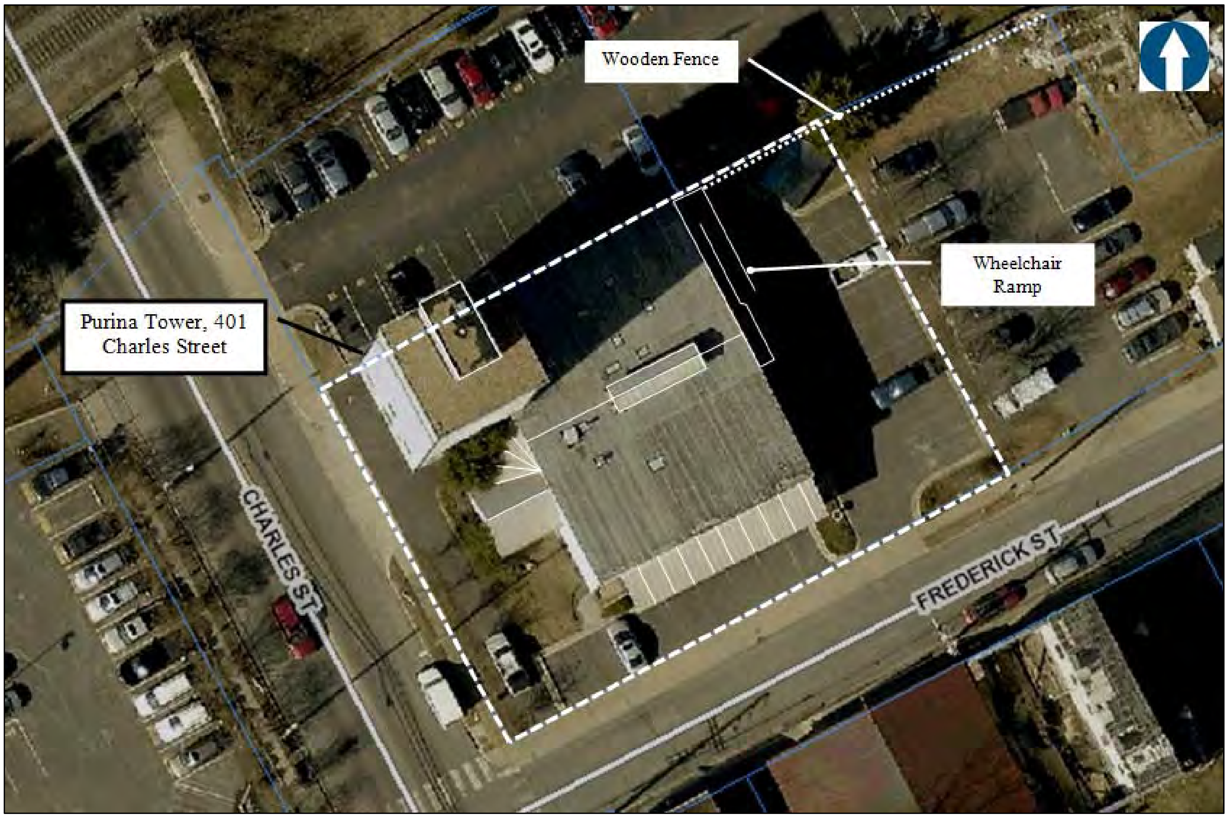

FIGURE 3-59: SITE PLAN OF 401 CHARLES STREET (111-0132-0020), FREDERICKSBURG, VIRGINIA, AS SHOWN ON A 2014 AERIAL PHOTOGRAPH (CITY OF FREDERICKSBURG 2017) (NOT TO SCALE)

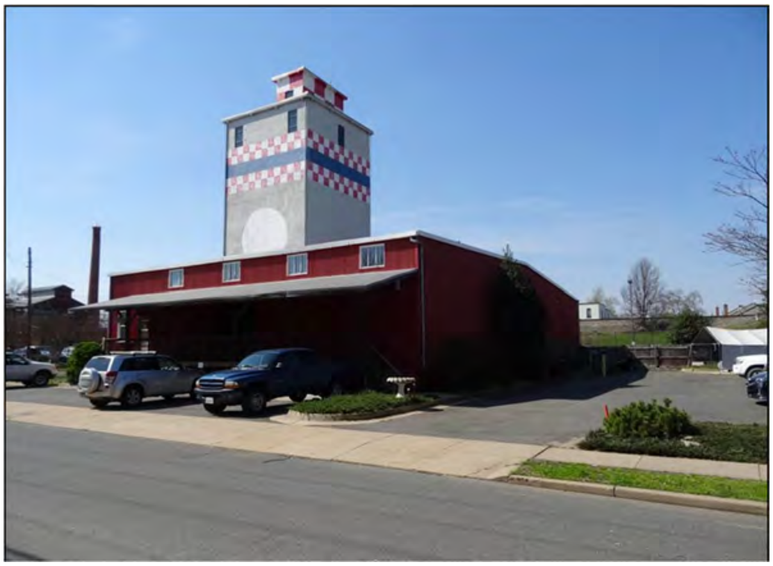

FIGURE 3-60: SOUTHEAST OBLIQUE VIEW OF PURINA TOWER COMPLEX

The warehouse section has a slightly raised, concrete-block foundation. The brick-and-wood frame is clad on the south and east elevations in corrugated metal, and parged along the west side. The north elevation is an aluminum-framed, glass curtain wall supported by a slightly raised brick foundation with concrete piers. The low-pitched, side-gable roof is sheathed in standing seam metal. A narrow, gable-roofed clerestory extending east-west along the central portion of the roof peak provides light to the interior (Figure 3-61 and Figure 3-62).

A wood porch, raised on square wood piers and framed by a balustrade of simple, square spindles, extends nearly the full length of the south elevation. A shed roof clad in corrugated metal extends out over the porch and a set of wood steps at the east and west ends provide access. Both have a single wood railing on their south (outer) side. The main entrance is marked by a set of recessed metal doors with a 14-pane, metal-framed, glass surround located near the center of the south facade. The current owner and his staff generally access the building via a single wood door situated near the west end of the south elevation. The door has a three-panel lower half and a three-light glass section in its upper half covered by metal-framed, wire mesh. A similarly designed entrance is also present on the building’s east elevation. Access is provided via a set of wood steps or a bi-directional wood access ramp. There are several other secondary entrances. A metal gate in the corrugated metal wall between the west elevation’s one-story addition and the grain elevator, leads to an open-air, side porch entry. A set of metal steps flanked by metal railings ascend to a triangular-shaped wood deck bordered by a metal balustrade. A wood-framed glass door at the back of the deck provides interior access. There are also two glass doors, separated by a narrow glass panel near the center of the glass wall, on the north elevation. Square, metal, access panels on the west elevation of the main block, the south wall of the one-story addition, and near the midpoint of the raised brick foundation on the north elevation provide basement level access.

Fenestration on the south elevation of the main warehouse block includes a single one-over-one, double-hung, wood window located just west of the entry door at the west end of the elevation, four, three-pane, wood-framed, casement windows centered in each of the four eastern bays just below the roof edge, and a glass block window under the porch. There are two, fixed, three-pane windows in the south half of the west elevation. An additional one-over-one, double-hung window is visible near the tympanum area on the west elevation.

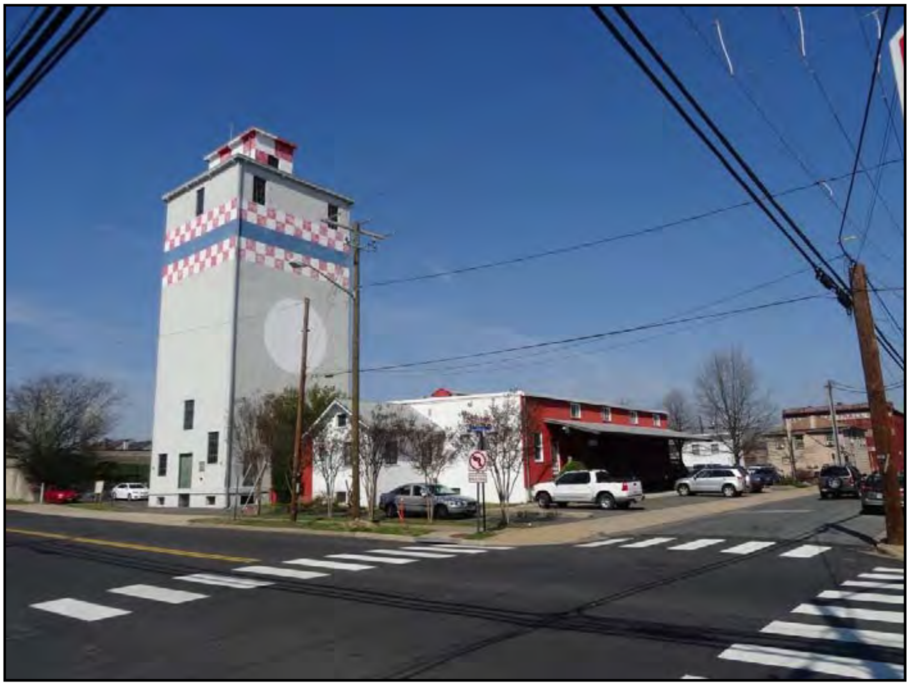

FIGURE 3-61: SOUTHWEST OBLIQUE VIEW OF PURINA TOWER COMPLEX

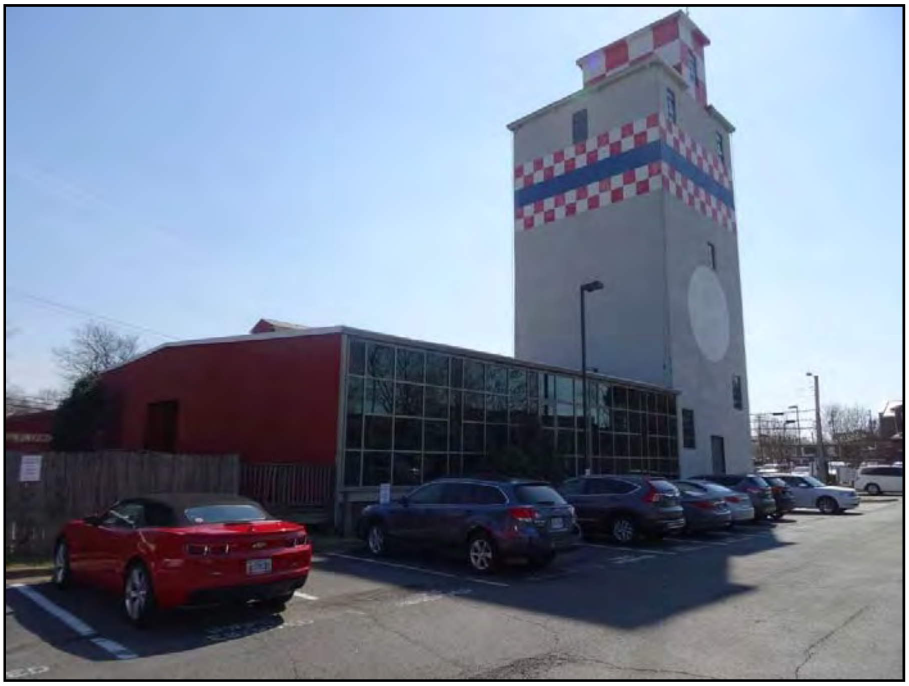

FIGURE 3-62: NORTHEAST OBLIQUE VIEW OF PURINA TOWER COMPLEX

There are two additions present, including a one-story, one-bay section on the west elevation that once housed a greenhouse and a six-story grain elevator adjoining the northwest corner of the main block. The one-story addition is situated near the southern end of the main block's west elevation. Its raised concrete-block foundation contains a full basement and supports a parged brick frame. The steeply-pitched, front-gabled roof is sheathed in standing seam metal with overhanging raking eaves supported by simple brackets. A slightly overhanging section of roof on the front (west) elevation is supported three wood brackets situated at either end and below the peak. Fenestration includes two, double, six-light, casement windows topped by four-light transoms on the south wall and one more located just south of the midline of the west elevation (Figure 3-63). A small, four-light, casement window occupies the north side of the latter.

On the west elevation there are two small, three-pane, casement windows located mid-way up the wall on the south side of the one-and-a-half-story addition and a new one-over-one, double-hung unit positioned near the roof peak just below the cornice on the north side of the addition (Figure 3-64). There are also five fixed, three-pane windows at the basement level, including two on the north and south elevations and one centered on the west elevation.

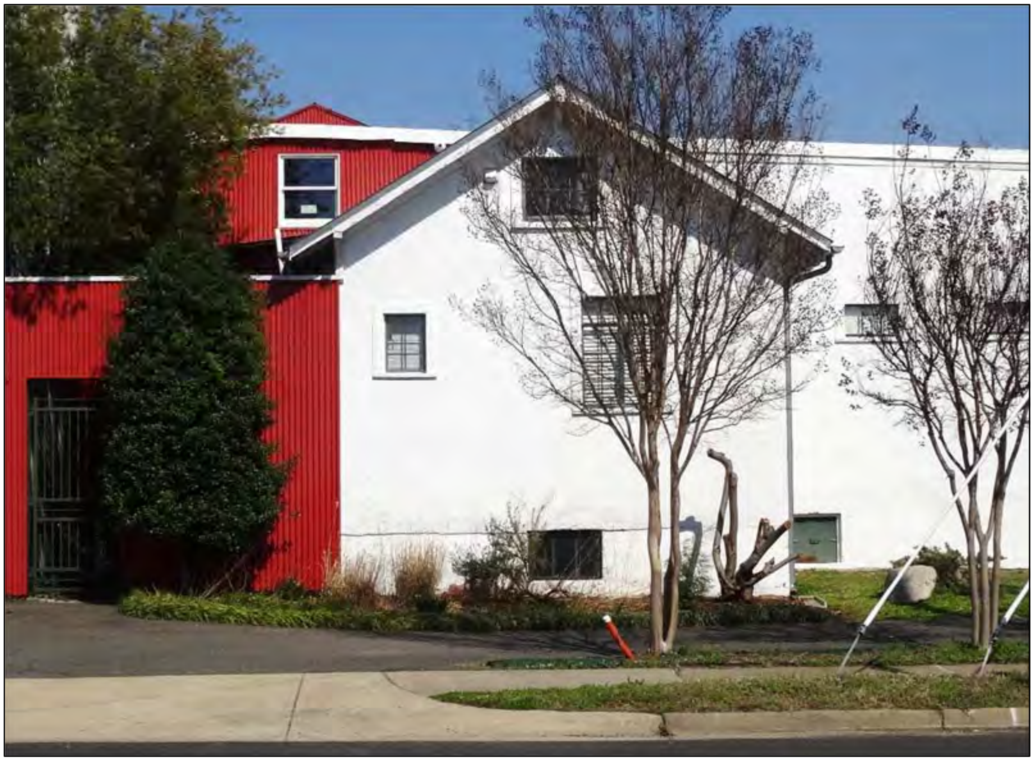

FIGURE 3-63: WEST ELEVATION OF THE ONE-STORY ADDITION ON WEST ELEVATION OF WAREHOUSE BLOCK AT PURINA TOWER COMPLEX

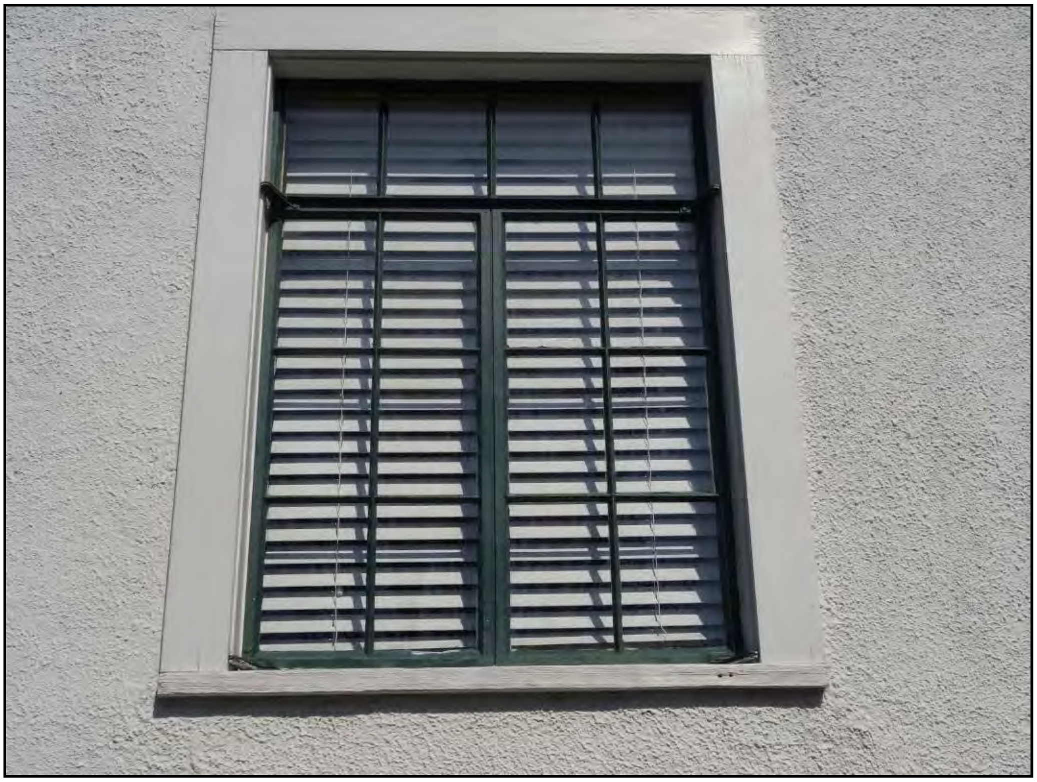

FIGURE 3-64: DETAIL VIEW OF METAL CASEMENT WINDOW

The second addition is the multi-story grain elevator which is approximately 80 feet tall (Figure 3-65). A raised concrete foundation set upon a concrete slab base supports a steel-reinforced, poured-concrete frame with a parged exterior. The flat, tar-and-pebble clad roof has slightly overhanging eaves supported by simple triangular brackets. Centered on the roof is a rectangular-shaped, concrete cupola with a hipped roof and the same overhanging eaves and brackets as the main tower block.

There are two sets of double-leaf doors just above the raised foundation at the center of the north and west elevations. Each is wood sheathed in metal. The tower's windows are primarily located in the upper and lower bays, and include original, 12-light, metal-framed units with pivoting, six-light, central sections; a single 12-light metal unit with an upper eight-light pivoting section, and four-pane, wood-framed, awning windows at ground level of the north, south and west elevations.

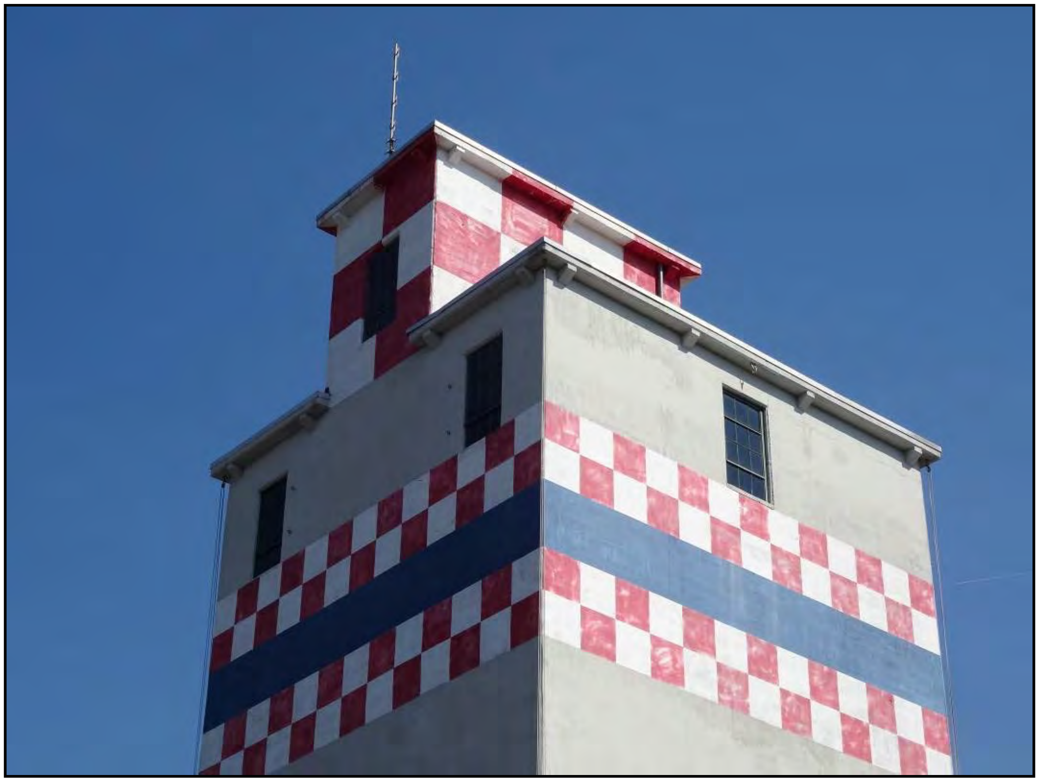

FIGURE 3-65: CLOSE-UP VIEW OF GRAIN ELEVATOR ROOF AND CUPOLA OF PURINA TOWER

3.5.2.2 Primary Resources Interior

The majority of the warehouse interior is open, save for a long, narrow, frame-walled section in the southwest corner that contains office spaces, a meeting room, and bathroom facilities. This corner section is internally subdivided by a frame wall that extends north-south through its center. The single, wood-paneled door near the west end of the main block's south elevation opens into a long, narrow, open space on the west side of this dividing wall, containing work areas. On the west wall, a few feet north of the entrance, stands a square cubicle bordered by low frame walls on its north, south, and east sides. A door on the east wall, across from the cubicle, accesses a meeting room/conference space. The rest of this area is open with several desks and tables along each wall. Original wood flooring is visible in the middle section of this space, with remainder covered in carpet. The walls and ceiling in this southwest corner section are finished in sheetrock (Figures 3-66 through 3-68).

A short distance north of the cubicle, a pair of wood doors on the west wall open into a square room that once housed the facility's greenhouse (but now serves as office space). The original pine wood floor in this room, which is now used as office space, is in generally good condition. Wood shelves frame the entrance on the room's east wall. Just north of the door to this space is a set of concrete steps that descend to the basement level. Metal railings and metal mesh frame the landing. On the east wall directly opposite the stairwell, is a solid wood door that opens into a square-shaped space. Solid wood doors on the north and south walls open into modern bathrooms. A third solid wood door near the southeast corner of the room leads to a narrow wood staircase that ascends to an unfinished attic space above. The remaining wood door centered on the east wall opens into the adjoining warehouse space.

A door at the north end of the long, narrow office/work space also opens into the building's open warehouse section. The exposed, wood roof framing visible in the ceiling is supported by large steel rafters and wood-boxed, steel columns positioned at the corners of each structural bays (Figure 3-69). The wood floors in this section of the warehouse are original and in generally good condition.

A large, sliding, metal door near the northwest corner of the warehouse space opens into the ground floor (working level) of the grain elevator tower. The majority of the original mechanical equipment, with the exception of a few elements stored in the northeast corner of the ground floor space (Figure 3-70), has been removed. The walls and ceiling are exposed concrete. Evenly distributed square holes, which mark the locations of the elevator's grain storage bins, are also visible in certain areas of the ceiling. One of the bays near the northwest corner of the tower extends as an open shaft to the floor of an enclosed space at the upper-most level. A metal ladder is affixed to the shaft's east wall and a pair of large beams is present on the west wall (possibly associated with a "man lift" mechanism used to transport workers up and down the tower). Two of the bays along the west wall are partially enclosed on the second level by frame walls with a door centered on the east side. A one-by-two-bay portion of the ground floor's southeast corner is enclosed and houses a small work/tool shop.

3.5.3 NRHP Evaluation

The industrial building known as the Purina Tower Complex (111-0132-0020) at 401–403 Charles Street is a former grain storage and shipping facility constructed in the early-twentieth century. It is one of downtown Fredericksburg's most familiar and important landmarks and has helped define the community's skyline for nearly a century. The multi-story, reinforced-concrete grain elevator was completed in 1920 and operated continuously until 1986. It was the first, and for several decades only, high-capacity facility in the Fredericksburg region and had an important impact on the area's agricultural economy during the first half of the twentieth century. The Young-Sweetser enterprise helped connect local and regional farmers with a broader market, reaching as far as the Chesapeake Bay, and "created a link between agriculture and industry" (NPS 1986).

It is one of the few, and possibly only, surviving reinforced-concrete buildings in Fredericksburg constructed using the slip-form method (May 1987:7). As previously discussed, this technique, which was developed in the late-nineteenth century, greatly enhanced the concrete construction process by allowing for a continuous pour (versus pouring in stages and waiting for each to dry) and saving significant time and cost. The facility remains in generally good condition and retains sufficient integrity of location, design, workmanship, setting, feeling, association, and materials, including original windows and interior wood flooring. The interior layout of the warehouse was altered somewhat in the 2000s when the current owner adapted a portion for use as office space. The resulting changes, including the addition of frame walls and new bathrooms are largely reversible.

The Purina Tower Complex is recommended eligible for individual listing in the NRHP under Criterion A, at the local level, in the areas of commerce and transportation. The 1920 grain elevator was the first high volume grain shipping and storage facility built in the area and shipped and received product by wagon, truck, train and barge. It had a substantial impact on the region's farmers and agricultural economy. The property bears no known associations with any particularly significant individuals, and is therefore not recommended eligible for listing in the NRHP under Criterion B. This resource is also recommended eligible for listing in the NRHP under Criterion C as a representative example of an early-twentieth century, high capacity grain elevator and shipping/storage facility, as well as a specific construction method known as slip-form, reinforced-concrete grain elevator. As an architectural resource, the property was not evaluated under Criterion D.

In sum, the early-twentieth century warehouse and grain elevator known as Purina Tower Complex at 401–403 Charles Street is **recommended eligible for the NRHP under Criterion A at the local level for its importance to the Fredericksburg area's agricultural economy, and under Criterion C at the local level as an example of an early-twentieth century, slip-form, reinforced concrete grain elevator**.

Additionally, this resource is situated within the boundaries of the Fredericksburg Historic District (111-0132). Its date of construction falls within the District's period of significance (1721–1921) and the building's design is reflective of the city's prevailing architectural and historic trends. As such, the property should be considered **a contributing element to the Fredericksburg Historic District**.

The proposed NRHP boundary for the Purina Tower Complex at 401–403 Charles Street follows the legal lot description for one Fredericksburg City parcel (Parcel Number 7789-23-0003) (Figure 3-71). The lot is bordered on the west by Charles Street, on the south by Frederick Street, and on the north and east by lots predominately filled with asphalt parking lots (Parcel Numbers 7789-23-1019, 7789-23-1107, and 7789-13-9170). The proposed boundary includes the Purina Tower and two asphalt parking areas. The period of significance for the Purina Tower starts in 1916, the date of its construction, and ends in 1992, when it stopped being associated with Fredericksburg's agricultural scene.

3.6 GEORGE ALER HOUSE (111-0132-0522)

The duplex known as the George Aler House at 314–316 Frederick Street (111-5296/111-0132-0522) is located in the City of Fredericksburg, Virginia, along the western bank of the Rappahannock River. The dwelling straddles two adjoining parcels, approximately 0.09 acres in combined area, on the southeast corner of the intersection of Frederick and Charles Streets, near the southern end of the City's downtown district (Figure 3-72). The building is situated in the property's northwest corner with minimal setback and its primary elevation facing north. Open areas of lawn containing several mature trees lie east and south of the dwelling. A section of approximately 6-foot-tall, vertical-plank wood fencing with a wood gate at its center runs along the north side of the east yard. Additional sections of wood fencing also border and subdivide the rear (south-side) yard spaces behind the duplex. A second wood gate located near the southwest corner of the building accesses a small brick patio behind the west-side, rear yard. A second brick patio is present in the east-side yard.

3.6.1 Historic Context

The two parcels presently associated with 314–316 Frederick Street were part of a larger, 330-acre tract purchased by Roger Dixon shortly after his arrival in Fredericksburg in 1749. The tract, which adjoined the town's southern boundary at the time, was subdivided and platted by Dixon in 1752. The current resource area became part of block 59, which was further subdivided into four lots, each 132 feet by 165 feet in dimension (approximately 0.5 acre in area) numbered 226, 227, 218, and 219. The latter, comprising the northwest quadrant of the block, was bordered by Prince Augusta Street (present-day Charles Street) in the west and Frederick Street in the north (Figure 3-73).

Interest in Dixon's new subdivision was slow to manifest. Though he had sold 33 of his 40 platted lots by the early 1760s, few had been improved in any way (Loyd n.d.). This was true of the area, which despite its sale in 1765, remained largely undeveloped for another 30 years (Spotsylvania County Deed Book [SCDB] F:702). The first reference to any structure on the property comes from a Mutual Assurance policy (#25) issued to William Harvey in 1796 on a building valued at $700.00 (MAS 1983). A sketch map included with the policy identified the parcel as Lot 219 and described a "Dwelling house 18 feet wide 24 feet long… two story high built of wood & covered with wood" that fronted on the south side of Frederick Street, at least 20 feet east of the intersection with Princess Augusta Street (present-day Charles Street) (Figure 3-74). Harvey, who had acquired the property in 1783, was a local merchant and one-time mayor of Fredericksburg in the early 1790s (CFDB A:46; The Virginia Herald 1791, 1792). The policy referred to a tenant named Samuel Lucas, so he apparently did not reside in the house.

FIGURE 3-74: SKETCH MAP RECORDED ON A MUTUAL ASSURANCE POLICY (#25) ISSUED TO WILLIAM HARVEY IN 1796 DEPICTING A TWO-STORY, WOOD-FRAME DWELLING ON A PORTION OF CITY LOT 219 (PRESENT-DAY 310 FREDERICK STREET) (MAS 1983)

Following Harvey's death in 1798, the property passed through several owners, including a gentleman named William Emmerson, who acquired Lot 219 and Harvey's frame dwelling in 1810 (CFDB D:275). Shortly thereafter he subdivided and sold a 73 feet by 132 feet section from its southern end (CFDB D:316).

The remaining northern portion of the lot was purchased by George Aler in 1843 (CFDB M:460). According to land tax records, the property came with one taxable structure, presumably the two-story frame dwelling built by William Harvey in the 1790s, valued at $400.00. Seven years later, in 1851, he paid fees on two taxable structures, including the two-story frame dwelling valued at $750.00 and a second, newly erected building assessed at $250.00 (Stanton 2013). The latter, as depicted on an 1886 Sanborn Fire Insurance map, was a two-story brick dwelling with a one-story, rear, brick addition situated on the northwest corner of the parcel, the same building currently associated with 314–316 Frederick Street (Figure 3-75). Tax records for 1854 and 1855 list Aler as the occupant of both buildings. A year later, the 1790s frame dwelling is listed as tenant-occupied and the new brick structure is described as a "jail" (Stanton 2013).

George Aler owned and operated the largest of Fredericksburg's brickyards at the time and, according to newspaper accounts, provided oversight, as well as labor and materials, for several notable construction projects around town, including St. Mary's Church on Princess Anne Street and the Fairgrounds, west of town (Fredericksburg News 1857; Hennessy 2010a; Weekly Advertiser 1854, 1857). Though not documented in historical records, it is reasonable to assume that he also provided the labor and materials for the construction of the two-story brick building on his Frederick Street property. Aler was also active in the civic arena, serving at various times as a member of city council and the Superintendent of Streets. Between the late 1840s and 1860, he was also Fredericksburg's leading slave trader (Hennessy 2010a).

It is this latter role that may help explain the "jail" reference appearing in the 1856 land tax records. Evidence from historical records, including, in particular, the documented testimony of a slave named Isaac Williams, whom Aler had purchased in the early 1850s, suggests the brick building on Frederick Street may have been constructed and, for a few years (1856–1859), utilized as a slave jail. In a manuscript entitled, *Sunshine and Shadow of Slave Life: Reminiscences As Told by Isaac D. Williams to "Tege,"* published in 1885, Isaac Williams offers the following account:

> Fitzhugh finally agreed to their terms and I was sold to George A. Ayler of Fredericksburg, Virginia, a town situated on the Rappahannock river. Thither I was removed and kept by him in a sort of pen, where slaves and cattle were huddled promiscuously together. I was locked up at night in a little room just large enough to stand up in and kept there for nine days; then I was sold to Dr. James, a Tennessee slave dealer, who gave fifteen hundred dollars for me. …One day I got leave to go across the road, to get some clothes that we had left in a house just opposite our prison pen [Williams 1885:9-10].

If William's testimony does describe the present-day dwelling at 314–316 Frederick Street, then the "little room" he mentions may have been located in some portion of the building's one-story rear addition.

The presence of an enclosure to house enslaved individuals adjacent to the rail tracks follows in line with a development pattern seen throughout Virginia in the middle of the nineteenth century. In 1808, Congress enacted the African Slave Trade Act, which halted the practice of importing enslaved people into the United States (Gudmestad 1993). At the same time, the mid-

Atlantic agricultural economy changed from labor-intensive crops such as tobacco to less labor-intensive goods such as wheat. This change in agricultural practice resulted in an overabundance of enslaved labor in the mid-Atlantic region. This is in stark contrast to areas further south, where tobacco, rice, indigo, and other labor-heavy crops were king (Laird 2010:6). Since the foreign slave market had been cut off in 1808, planters in the south looked for other ways to meet their labor needs; one of the most prolific was purchasing individuals from the "overstock" areas to the north. This resulted in what has been called the "interstate slave trade" in America, which emerged in the 1820s and was prolific until the Civil War (i.e., Gudmestad 1993; Wright 1993:28–32).

Like many individuals in Alexandria and Richmond, such as Robert Lumpkin, George Aler capitalized on this trend. He owned two potential slave jails in downtown Fredericksburg: one at 300 Caroline Street and the second at 314–316 Frederick Street. Both are within a block or two of the railroad tracks and near the Rappahannock River, but outside of the dense commercial core thus keeping overt evidence of the darkest side of slavery out of the direct public eye.

References in the land records to the building at present-day 314–316 Frederick Street as an active jail cease after 1859. The following year, the occupants of both of Aler's dwellings are listed as "tenants." In 1861, Aler sold his portion of Lot 219 to Elizabeth McDougal, which included both the two-story, brick building and the 1790s frame house just to the east (CFDB T:296). Land records indicate that during her ownership tenure, Mrs. McDougall occupied half of the brick duplex and rented the other section to various tenants including, beginning in 1869, her daughter, Mary Jane Gately.

In 1889, the eastern portion of the property containing the 1790s frame dwelling was subdivided and sold to William King (CFDB CC:176). Two years later, Elizabeth McDougal passed away leaving her remaining portion of Lot 219, containing the brick dwelling, to her daughter, Mary Jane Gately (CFWB I:323). The latter conveyed a deed of trust on the property to the Enterprise Building Association in 1894 and, in 1898, was sold by a special commissioner appointed in chancery suit involving Mary Jane Gately to Ella M. Hicks and her husband Richard for $400.00 (CFDB EE:561, HH:245).

It is not entirely clear if the brick dwelling at 314–316 Frederick Street was originally constructed as a duplex or if it was later reconfigured to serve as such, possibly in the late 1890s or very early 1900s. Sanborn Fire Insurance maps published in 1886, 1891, and 1896 show only one street number (#222) in front of the building, no interior dividing wall, and a single, centrally located, interior doorway connecting the main block with the one-story rear addition (Figure 3-76) (Sanborn Map Company 1886, 1891, 1896). A Sanborn map published in 1902 however, depicts a two-unit dwelling with two assigned street numbers (#312 and #314) and two interior doorways leading to the rear addition (Figure 3-76) (Sanborn Map Company 1902). The 1902 map also indicates two apparently recent subdivisions of the lot, including a narrow strip from the northwest corner of the parcel with a lot line that extended north-south through middle of the brick dwelling, and a section from the south end of the property. Land records confirm that in 1900, then-owner Ella Hicks built a small two-story, frame dwelling (present-day 317 Charles Street) on the 26.5 feet by 51 feet parcel subdivided from the south end of her Frederick Street lot.

FIGURE 3-75: DWELLING AT PRESENT-DAY 314–316 FREDERICK STREET SHOWN ON AN 1886 SANBORN FIRE INSURANCE MAP (SANBORN MAP COMPANY 1886)

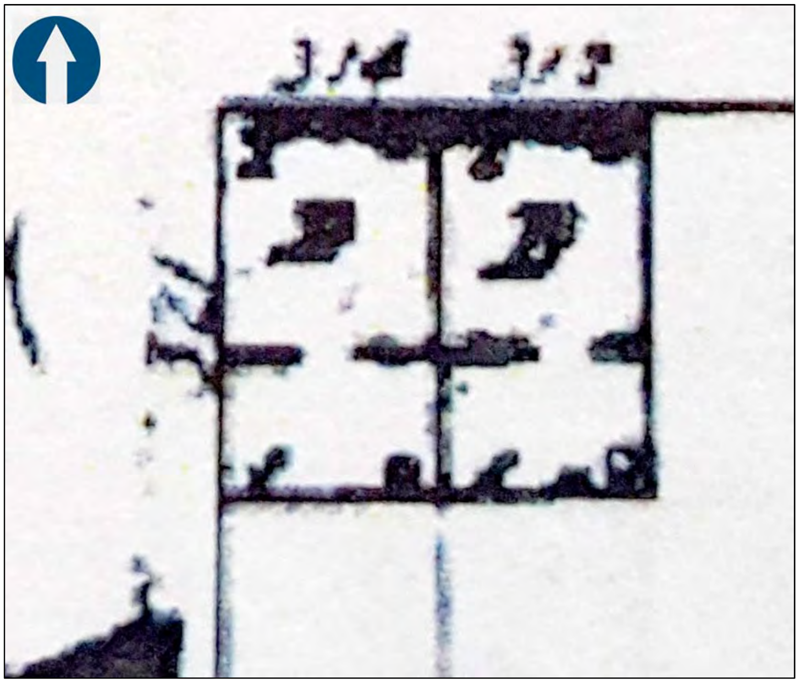

FIGURE 3-76: GEORGE ALER HOUSE, 314–316 FREDERICK STREET SHOWN ON A 1902 SANBORN FIRE INSURANCE MAP (SANBORN MAP COMPANY 1902). NOTE: THE SKETCH SHOWS TWO INTERIOR DOORWAYS (ON REAR WALL OF MAIN BLOCK) FOR FIRST TIME.

Beginning in the late-nineteenth through the early-twentieth centuries, Mrs. Hicks and her husband, Richard Hicks, invested heavily in real estate, acquiring over 20 individual parcels near the south end of downtown (O'Brien 1999:4–5). The majority of these lay in the vicinity of Princess Anne, Charles and Prince Edward streets, including the property directly south of the 314–316 Frederick Street parcel (designated 317 Charles Street) (CFDB HH:245).

Sometime between 1927 and 1941, as evident from a review of Sanborn Fire Insurance maps, a one-story, four-bay, single-pile, frame addition was erected on the rear (south) elevation of the building's one-story, rear, brick addition (Figure 3-77) (Sanborn Map Company 1941). In a photograph taken in 1949 looking north along Charles Street from a point just south of 314–316 Frederick Street, this second rear addition appears to be a partially-enclosed, shed-roofed porch.

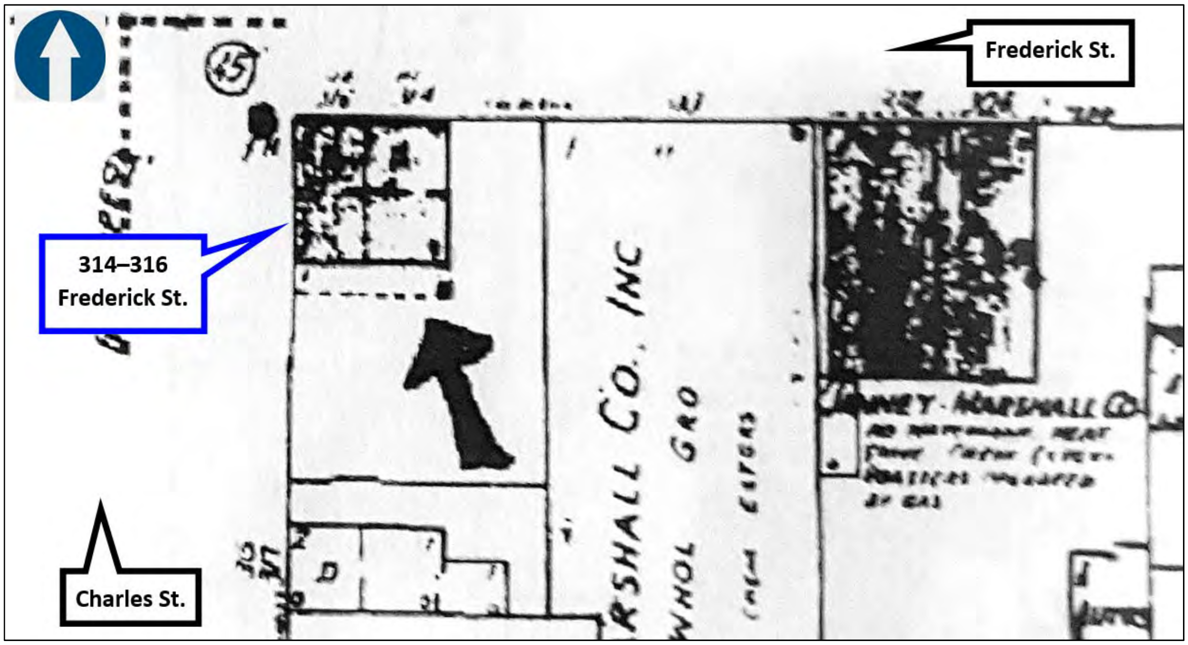

FIGURE 3-77: GEORGE ALER HOUSE, 314-316 FREDERICK STREET SHOWN ON A 1941 SANBORN FIRE INSURANCE MAP (SANBORN MAP COMPANY 1941). NOTE: A ONE-STORY FRAME ADDITION HAS BEEN ERECTED ON THE REAR (SOUTH) ELEVATION OF THE DWELLING.

Following Ella's death in 1935, the property remained in the family until 1973, when the lot and dwelling were sold by Betty Sivak and her husband to the HFFI, a local preservation advocacy group (CFDB 150:101). The latter re-conveyed the property a year later, but retained a preservation easement, which was recorded with the deed (CFDB 152:248-249). A mid-twentieth century photograph of the building's north elevation shows that the façade has not been greatly altered; however, a 1949 photograph of the duplex's rear shows the second-story, brick addition visible on the current building (Figures 3-78 and 3-79) (Strobel 2015).

3.6.2 Architectural Description

3.6.2.1 Primary Resource Exterior

The property's primary built resource is a two-story, four-bay, vernacular-style duplex constructed in 1851 (Figure 3-80). The building's rectangular plan, measuring approximately 28.0 feet by 33.0 feet in dimension, is oriented east-west with minimal setback and its primary elevation facing north (Figure 3-81). A continuous brick foundation supports the main block's brick frame, set in a five-to-one, common bond pattern, and a shallow-pitched, side-gabled roof clad in composite shingles. A large, central-interior, brick chimney with a corbelled cap rises above the main block and a second, smaller, interior brick chimney is visible near the center of a two-story, rear addition.

CHARLES ST

FIGURE 3-80: SITE PLAN OF GEORGE ALER HOUSE, 314–316 FREDERICK STREET (1121-0132-0522) (CITY OF FREDERICKSBURG 2017) (NOT TO SCALE)

The two main entrances to the duplex are marked by a short brick stoop and a modern, six-paneled, wood door situated near each end of the primary (north) elevation. Both doorways are recessed slightly and the east-end door is topped by a slightly-splayed, brick lintel. There are two additional secondary entrances on the rear (south) side of the building, each marked by a modern, two-paneled, wood door with a nine-light section of glass in their upper half. The west-side entrance is located near the west end of the south elevation of a one-story, one-bay frame addition. The second is situated on the east elevation of a one-story, one-bay, frame addition located near the east end of the building's rear elevation.

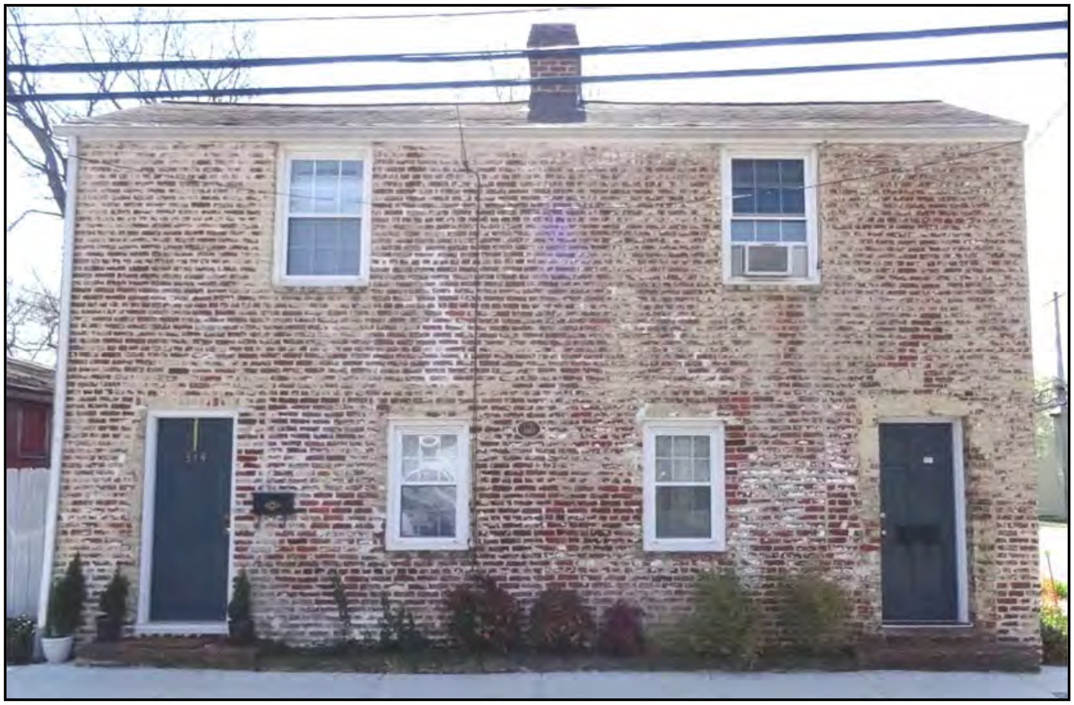

FIGURE 3-81: PRIMARY (NORTH) ELEVATION OF GEORGE ALER HOUSE, 314–316 FREDERICK STREET

Fenestration consists of one-over-one, double-hung, vinyl windows with simulated divided lights, brick sills, and molded wood frames. There are four windows on the primary elevation, including two symmetrically placed between the east- and west-end entrances, and two on the second floor centered in each half of the facade just below the roof's simple molded cornice. The remaining fenestration includes a single window on the east and west elevations on the first floor of the rear, two-story, brick addition, and two windows on the second floor of the building's rear elevation placed just below the roof on either side of the building's midline. The latter have molded frames, but no brick sills.

A one-story, four-bay, single-pile, brick addition, set in a five-to-one common bond, was added to the main block's rear elevation either at the time of the building's original construction or shortly thereafter. A second-floor, four-bay, single-pile, brick addition was erected atop the first-story addition sometime after 1958 as evidenced by a photograph taken that year, which shows only one story. The brick frame is set in an all-stretcher bond configuration. A one-story, four-bay, frame porch erected on the rear of the building during the early-twentieth century was later removed and replaced with two one-story, single-bay frame, rear-entry additions sometime in the late 1900s. The existing additions each have a shed roof sheathed in composite shingles. The existing east- and west-side frame additions are clad in vinyl- and beaded-weatherboard siding, respectively, and both are topped by a shed roof sheathed in composite shingles.

3.6.1.2 Primary Resource Interior

Access to the interior of the duplex's eastern section (314 Frederick Street) was not possible, but according to the homeowner, the two sides mirror one another very closely in terms of appearance, layout, and detailing (Michael Pappas, personal communication 2016). Though not currently visible, there is reportedly an interior doorway in the second floor's central dividing wall, which was covered over when new sheetrock was installed in the 1970s (Michael Pappas, personal communication 2016). If original, the door's presence would suggest there was free movement between the building's two halves for some period of time. The front entrance to the western half of the building (316 Frederick Street) opens into a large, open living room space with a wood, closed-string staircase situated along the west wall that ascends to the second floor. The latter has a plain, square-plank handrail and simple, square balusters topped with turned caps. A small storage space lies beneath the south end of the staircase. The ceiling and walls are finished in sheetrock. The pine wood flooring in the main block's first and second levels are original. Additional wood trim details include molded chair rails, baseboards with cavetto-style base caps, and molded wood door and window surrounds. There is a contemporary brick fireplace centered on the east wall. It has a slightly raised brick hearth, a four-panel glass screen, and a simple, white-painted, built-up, mantel shelf supported in front by two L-shaped, wood brackets (Figure 3-83).

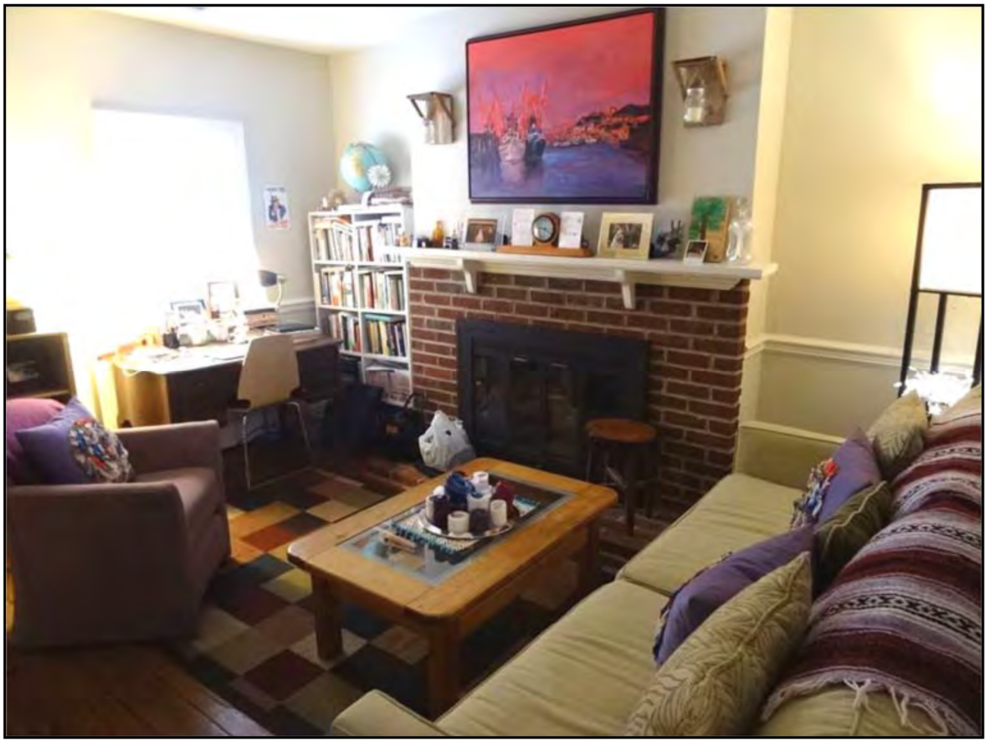

FIGURE 3-82: FIRST FLOOR LIVING ROOM AND BRICK FIREPLACE ON THE EAST WALL, LOOKING NORTHEAST

An opening near the west end of the rear (south) wall steps down into a kitchen space in the rear brick addition. The broad, wood-plank threshold of this doorway is original and years of use have created a concave depression near its center. The kitchen beyond has an unpainted, wood-plank ceiling and alternating black-and-white linoleum tiles cover the floor (Figure 3-83). There is a contemporary brick fireplace installed at an angle in the southeast corner of this space. It has a slightly raised brick hearth, a four-panel glass screen, and an unpainted mantel very similar in appearance to the one in the living room. The angled wall space above the fireplace is covered with stained, horizontal, wood planks. An open doorway in the south wall steps down into the one-story, rear, frame addition, which contains a laundry area and an enclosed half-bath.

The staircase in the living room ascends to a large, open bedroom on the second floor (Figure 3-83). A simple wood-plank railing secured by two square posts and topped with turned caps surrounds the second-floor landing. The walls and ceilings are finished in sheetrock and pine wood flooring is original. The room's lone window has a molded wood surround and a plain wood sill. There is a modern brick fireplace centered on the east wall identical to the one in the living room below. A shallow closet with wood louvered doors occupies the space on the south side of the fireplace. Reportedly, the interior doorway that once connected the two halves of the building still exists behind the sheet rock on the back wall of the closet (Michael Pappas, personal communication 2016). A square wood panel near the northwest corner of the ceiling provides access to an attic space. A six-panel, wood door centered on the north wall opens and steps down into a second bedroom in the rear brick addition. The walls and ceiling are covered in sheetrock and floor is carpeted. Another six-panel wood door on the east wall opens into a modern full bath.

3.6.3 NRHP Evaluation

The duplex, known as the George Aler House, at 314–316 Frederick Street is a vernacular dwelling constructed in 1851. It is unclear whether the building was originally constructed as a duplex or as a single-family home that was later reconfigured to serve as such. For the first five years following the building's construction in 1851, then-owner, George Aler, is listed in land tax records as the tenant of both the brick building and the 1790s frame dwelling on his portion of Lot 219. Between 1856 and 1859, the frame house is described as tenant-occupied and the brick building as a jail. By 1902, a Sanborn map shows an interior dividing wall extending north-south through the center of the building. Though it has undergone a number of interior and exterior changes over time, the core of the original building remains intact and in generally good condition. Changes to the dwelling's interior have also been made over the years, including the replacement of wall- and ceiling-plaster, however other original materials (in the main block), such as the wood flooring, molded wood chair rails and base boards, door and window surrounds, fireplace mantels, and staircase, still survive. These elements still collectively reflect the home's relatively modest, almost utilitarian, interior design, which reflects the surrounding neighborhood's mixed industrial/residential character that manifested and evolved during the late-eighteenth- and early twentieth-centuries.

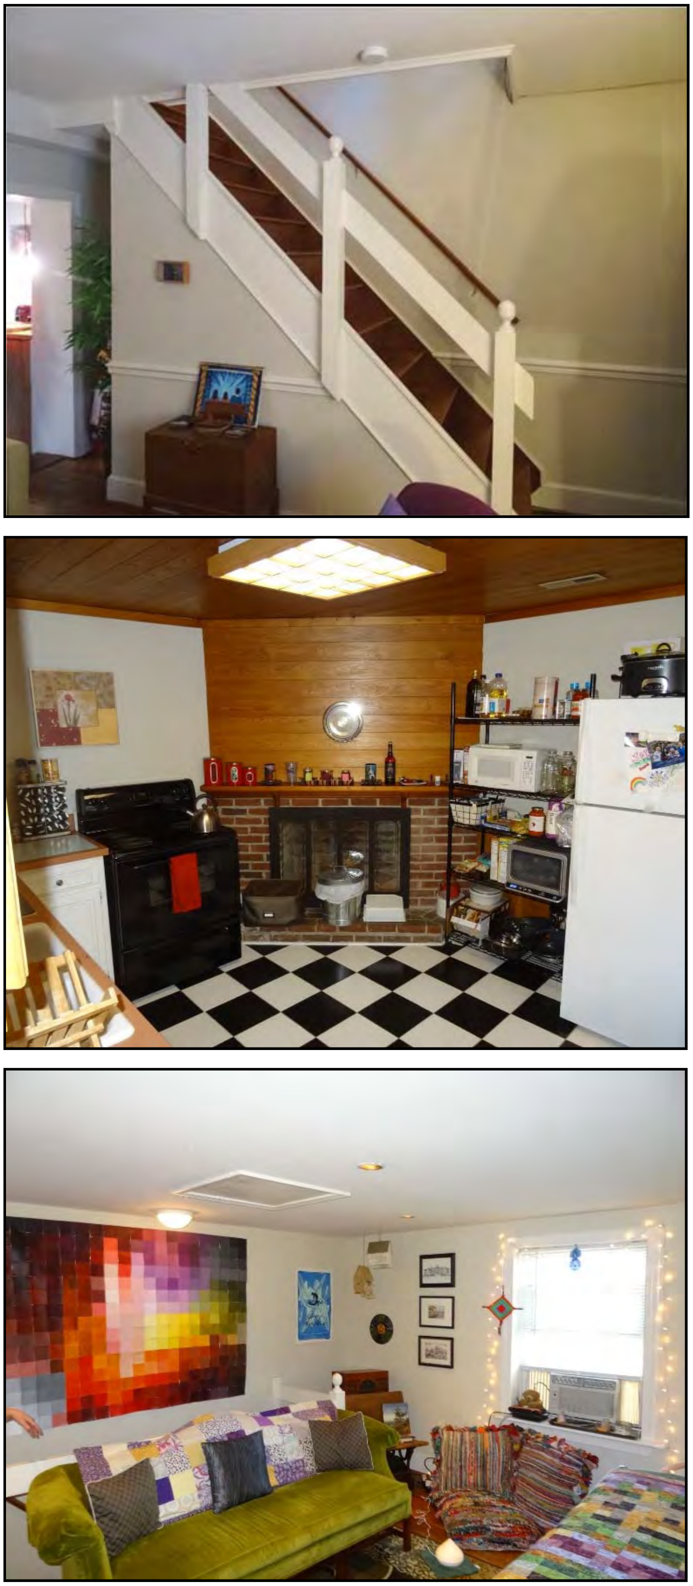

FIGURE 3-83: STAIRCASE ON WEST WALL OF FIRST FLOOR LIVING ROOM, LOOKING SOUTHWEST (TOP); OVERVIEW OF KITCHEN AND BRICK FIREPLACE IN SOUTHEAST CORNER, LOOKING SOUTHEAST (MIDDLE); SOUTH BEDROOM ON SECOND FLOOR, LOOKING NORTHWEST (BOTTOM)

Though the building has undergone a number of changes over time, including several additions and the replacement of all original exterior siding and windows, it retains sufficient integrity of design, location, association, workmanship, setting, and feeling to merit NRHP-eligibility consideration. It is recommended eligible for individual listing on the NRHP under Criterion A for its associations with Fredericksburg's African American population and slave trade during the mid-1800s. It is one of the last extant buildings with a direct association to the practice of slavery in Fredericksburg and one of the few above-ground reminders of the slave trade in Virginia in most areas, such as the Shockoe Bottom in Richmond, all evidence of this practice were demolished in the late-nineteenth and early-twentieth centuries.

It is also recommended eligible for listing on the NRHP under Criterion B at the local level for its associations with George Aler, who was Fredericksburg's leading slave trader from the 1840s through 1860. Though the building survives as one of Fredericksburg's few mid-nineteenth-century brick duplexes, its design does not embody any distinctive characteristics of a type, period, or method of construction, or represent the work of a master, or possess high artistic values and is therefore, not recommended NRHP-eligible under Criterion C. As an architectural resource, the property was not evaluated under Criterion D.

In sum, the George Aler House at 314–316 Frederick Street is **recommended eligible for the NRHP under Criterion A at the local level for its association with Fredericksburg's African American community and Criterion B at the local level for its association with George Aler.**

Additionally, this resource is situated within the boundaries of the Fredericksburg Historic District (111-0132). Its date of construction (1851) falls within the District's period of significance (1721–1921) and the building's design is reflective of the city's prevailing architectural and historic trends. As such, the property should be considered **a contributing element to the Fredericksburg Historic District.**

The proposed NRHP boundary for the George Aler House at 314–316 Frederick Street follows the legal lot description for two parcels in their entirety (Parcel Numbers 7789-22-0849 and 7789-22-0827) (Figure 3-84). It is bounded on the northwest by Frederick Street, on the southwest by Charles Street, on the southeast by a lot containing a single-family dwelling (Parcel Number 7789-22-0856), and on the northeast by a large industrial building (Parcel Number 7789-22-1954). The proposed boundary for this resource includes the George Aler House, fence, and enclosed yard. Because this resource is significant only during the ownership of George Aler, the period of significance spans from 1851, when the house was constructed, to 1861, when Aler sold it the property to Elizabeth McDougal.

3.7 PULLIAM'S SERVICE STATION (111-0009-0795)

The property presently known as Pulliam's Service Station (111-0009-0795), is located at 411 Lafayette Boulevard in within the boundaries of the Fredericksburg Historic District Expansion (111-0009) in the City of Fredericksburg, Virginia. The parcel is more particularly located on the northeast corner of the boulevard's intersection with Kenmore Avenue (Figure 3-85). The surrounding neighborhood is marked by a mix of commercial and industrial properties.

3.7.1 Historic Context

The property located at 411 Lafayette Boulevard was part of lot 292 in the southwest corner of city block 86 of Fredericksburg. Between 1902 and 1904, a local businessman named J. W. Masters acquired lot 292 and a north-adjoining property (lot 293). He established a planing mill and lumber yard business on the northern two-thirds of the combined parcel. As evident on the 1927 Sanborn Fire Insurance map shown in (Figure 3-86), the lower portion of Masters' property (the current 411 Lafayette Boulevard lot), remained undeveloped, due in part to the fact that a section of an old mill race still extended through the parcel's southwest corner.

The late 1920s witnessed several developments that would help shape the future of the 411 Lafayette Boulevard lot. In 1927, a new section of Route 1 connecting Richmond with Washington, D.C. was completed. The roadway passed through downtown Fredericksburg bringing traffic along Princess Anne Street and Lafayette Boulevard (then-called National Boulevard). A year or two later, Kenmore Avenue was extended southward to Lafayette Boulevard covering the mill race mentioned above. Finally, in 1929, J. W. Masters died and ownership of lots 292 and 293 passed to his two children, Ada and Howard Masters (CFWB R:2006; Spencer 2013).

The siblings, along with Ada's husband, Edward Gibson, continued operating their late father's mill and lumber yard for several more years (Spencer 2013). Around 1936, the family, no doubt seeing the potential investment opportunity that Route 1 presented, decided to develop the south end of the Prince Edward Street parcel. A year later, a new filling station was erected on the site and leased to a man named, T. Olin Linthicum (Fredericksburg City Directory 1938). The new Linthicum Service Station was a rectangular-shaped, one-story building of concrete block construction. Interestingly, it featured a Mission Revival-style design with a hipped, terra cotta-tiled roof, a white stuccoed exterior, and large storefront windows. As shown in a 1938 photograph, the building fronted onto a large concrete parking lot with the pumps out front and a fence lined with planted shrubs, running along the north and east sides of the lot. A tall sign near the road bearing a star-in-circle logo announced to drivers that the new station sold Texaco Oil Company products (Figure 3-87). The photo also shows what may be a possible service area just to the west of the station (same location of the site's current two-bay garage).

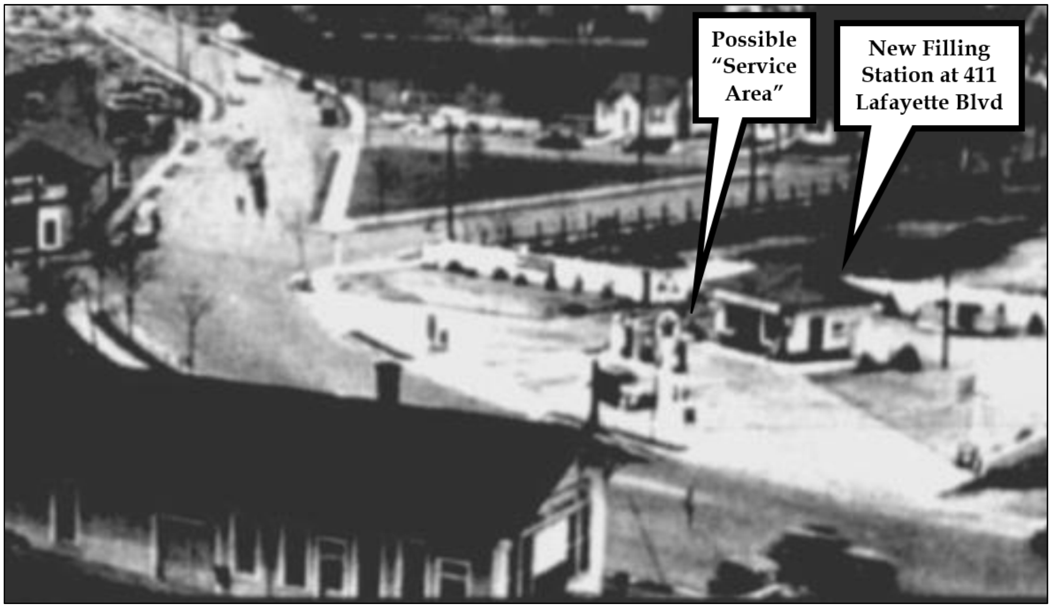
FIGURE 3-86: THE 411 LAFAYETTE BOULEVARD LOT SHOWN ON A 1927 SANFORD FIRE INSURANCE MAP (SANBORN MAP COMPANY 1927)



Possible "Service Area"
New Filling Station at 411 Lafayette Blvd

FIGURE 3-87: 1938 PHOTOGRAPH OF 411 LAFAYETTE BOULEVARD, LOOKING WEST (RAINES 1938)

The first filling stations, which began to appear around 1910, were simple, curb-side hand pumps connected to a below- or above-ground tank (Figure 3-88) (Lienhard 1997). When congestion due to increasing traffic made access to the pumps problematic, they gave way to a new form: the drive-up filling station. The first of these were typically one-story, rectangular-shaped buildings with gas pumps out front, covered, in some cases, by a canopy. Many were built along gateway corridors, ideally on corner lots with two or more points of access. Where they adjoined residential neighborhoods, station designers began incorporating revival-inspired architectural styles popular at the time, such as the Colonial and Tudor Revival styles, to give them a more "house-like" appearance and better blend them into their surroundings (Figure 3-89). The "house type" model typically contained office/sales space, a storage area, and public restrooms (Center of Preservation Research [CoPR] 2015:3; Jakle and Sculle 1994:45; Randl 2008; Rosin 2010:4). At the same time, gas stations were also becoming increasingly tied to corporate identity. Oil companies developed standardized, prefabricated designs intended "to coordinate logos, color schemes, signage, and building architecture" (Kaszynski 2000:65). The Texaco Oil Company, which by the 1920s had expanded to 46 states, including Virginia, had adopted the Mission Revival style for many of its new stations, featuring terra cotta-tile roofs, large windows, and stucco exteriors (Landscape Change Program 2011; Moore and Mace 2016:4-11).

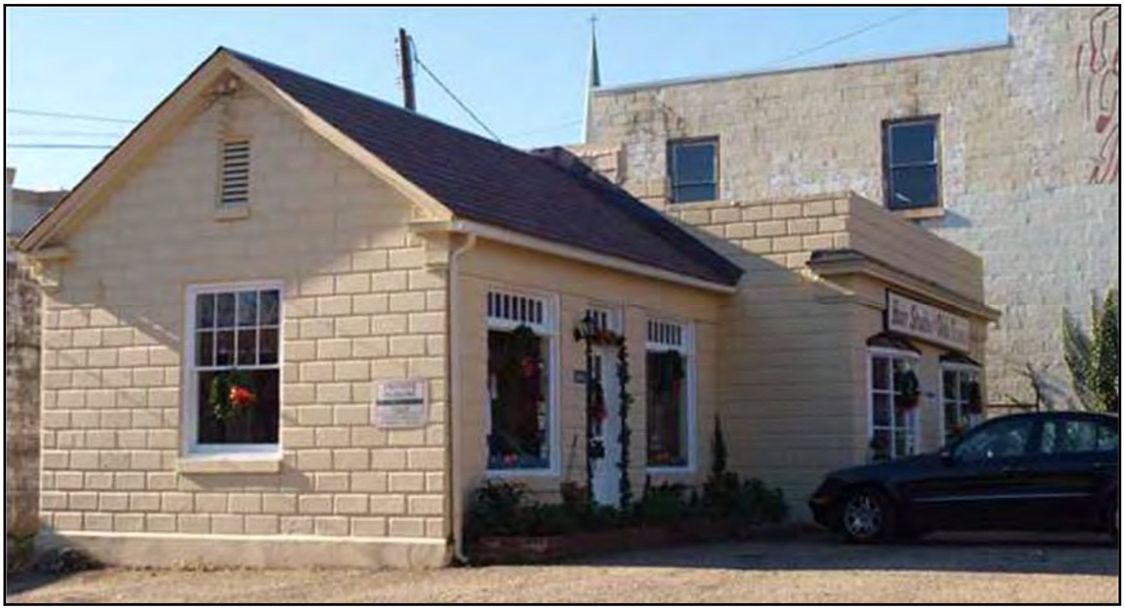

FIGURE 3-89: FORMER “HOUSE-STYLE” GAS STATION AT 100 WILLIAM STREET (CITY OF FREDERICKSBURG 2017)

Around 1940, the one-story, concrete-block building that presently stands on the east side of the 411 Lafayette Boulevard lot, was constructed, and as indicated on the 1941 Sanborn Fire Insurance map shown below (Figure 3-90), housed a restaurant.

FIGURE 3-90: THE 411 LAFAYETTE BOULEVARD PROPERTY SHOWN ON A 1941 SANBORN FIRE INSURANCE MAP (SANBORN MAP COMPANY 1941)

The presence of the new eatery, which was advertised as “Mack’s Lunch” in the 1947–1948 Fredericksburg City Directory and had its own address (407 Lafayette Boulevard), was not unusual for this period. Prior to World War II (WWII), the terms "filling station" or "gasoline station" were standard. During the 1930s, however, owners began expanding their auto-related products and adding new auto repair services and by the post-War period, the term "service station" had become common (Keenov and Baxter 2005:E-11). Expanded services were not exclusively limited to automobiles. Many stations also added sit-down restaurants and curbside food service to attract tourist traffic. A block south of the Linthicum Service Station, the Horton's Esso Filling Station and Dining Room offered an indoor restaurant and served curbside barbeque (Figure 3-91).

In 1946, Edward Gibson acquired his brother-in-law, Howard Masters' half interest in the 411 Lafayatte Boulevard lot (CFDB 82:451). A year later there was apparently a change in management and corporate affiliation as the 1947–1948 city directory lists the business as Blackley's Esso Station. In 1949, the name changed again to Johnson & Hurlock's Mobil Gas. Also around this time, the circa-1940, one-story building was repurposed as office space for a used cars enterprise called Blackley's Used Cars (Spencer 2013).

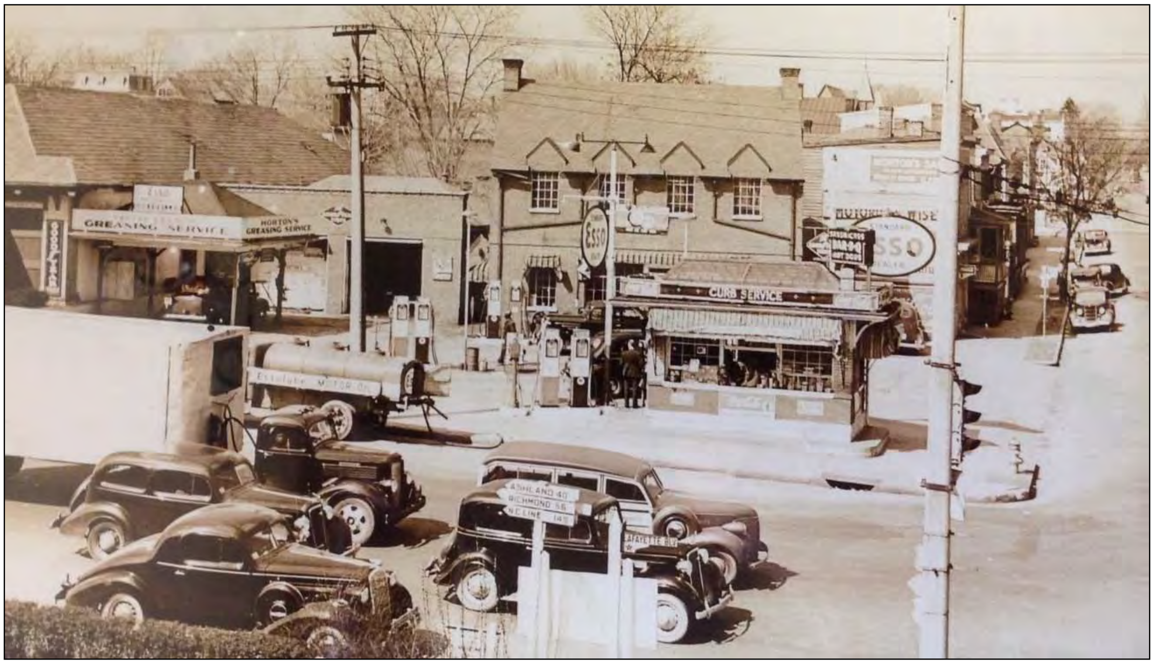

FIGURE 3-91: EARLY-TWENTIETH CENTURY PHOTO OF HORTON'S ESSO FILLING STATION AND DINING ROOM (301 LAFAYETTE BOULEVARD) (CENTRAL RAPPAHANNOCK HERITAGE CENTER [CRHC] CIRCA 1930)

The 1950s were a period of expansion and improvement for the operation at 411 Lafayette Boulevard. In 1951, Edward Gibson, as the owner, was issued a permit to construct a new 26.5 by 28-foot "service shop & grease storage addition" (Stanton 2014). The permit describes the proposed structure as an addition, but its dimensions closely match those of the detached two-stall service garage that presently stands on the lot. The new building's design, featuring simple, rectangular-shaped massing and a flat roof, was typical of service stations during this era. The previously-discussed expansion of auto-related products and service offerings that manifested in the 1930s had, by the post-WWII years, spurred another shift in gas station form. The previous "house style" model was replaced by the "oblong box," an expandable, rectangular-shaped form comprised of adjoining, flat-roofed bays that housed space for additional auto services (Jakle and Sculle 1994:144, 156).

In 1955, the property's circa-1940, one-story building, which up to this point had maintained its own address (407 Lafayette Boulevard), was folded into the site's service station facilities (Spencer 2013). Three years later, in 1958, Gibson was issued another permit for the installation of two 4,000-gallon, below-ground, gas tanks (Stanton 2014).

Edward Gibson passed away in 1972 and, sometime thereafter, ownership of the station and lot was conveyed to Johnson & Hurlock. A year later the business became a Texaco station and operated as such for the next decade. In 1983, Rixey Johnson gained full ownership and changed the name of the business to Johnson's Automotive (Spencer 2013). In 1989, after 42 years in the business, Johnson retired and leased the property to Kennedy's Towing and Repair. Two years later, the lot and facilities were purchased by Lee P. Rowe for $45,000. In 1995, the site was leased to its current proprietor, Pulliam's Auto Center, Inc. (CFDB 242:313; Spencer 2013).

3.7.2 Architectural Description

The built complex includes a circa-1937, single-story, filling station flanked on either side by a detached one-story garage and is set on a 0.39-acre, irregularly-shaped lot with a curved southern boundary that follows the alignment of the roadway connector between Kenmore Avenue and Lafayette Boulevard (Figure 3-92). The parcel is flat and open with covered primarily by a mix of concrete and paved-asphalt parking areas and is accessed from the street at the southeast and southwest corners of the lot. The site is bordered by a large paved parking lot to the north and a poured concrete sidewalk along the south. Vegetation is limited to a narrow strip of grass along the east side of the parcel and small grassy areas on the north side of the built complex. A vertical-plank, wood fence composed of 6-foot, arched sections fastened to square wood posts borders the north and east sides of the parcel. The posts are topped by a pointed finial. Additional wood fencing extends laterally from the filling station in center to the east- and west-flanking garages. The latter has a paired set of gates at center, providing access to parking area in the northeast corner of the parcel.

3.7.2.1 Primary Resource Exterior

The property's primary resource is a one-story, one-bay (structural), former filling station constructed circa-1937 in the Spanish Mission Revival style. The building is set back some distance from the street near the center of a 0.39-acre lot with its rectangular plan oriented east-west and its primary elevation facing south. A concrete slab foundation supports the building's concrete-block frame. The latter is clad in white stucco with grey trim and topped by a hipped roof sheathed in original, terra-cotta, barrel tiles with broad overhanging eaves. A single, faux, interior, brick chimney is visible near the east end of the roof ridge (Figures 3-93 and 3-94).

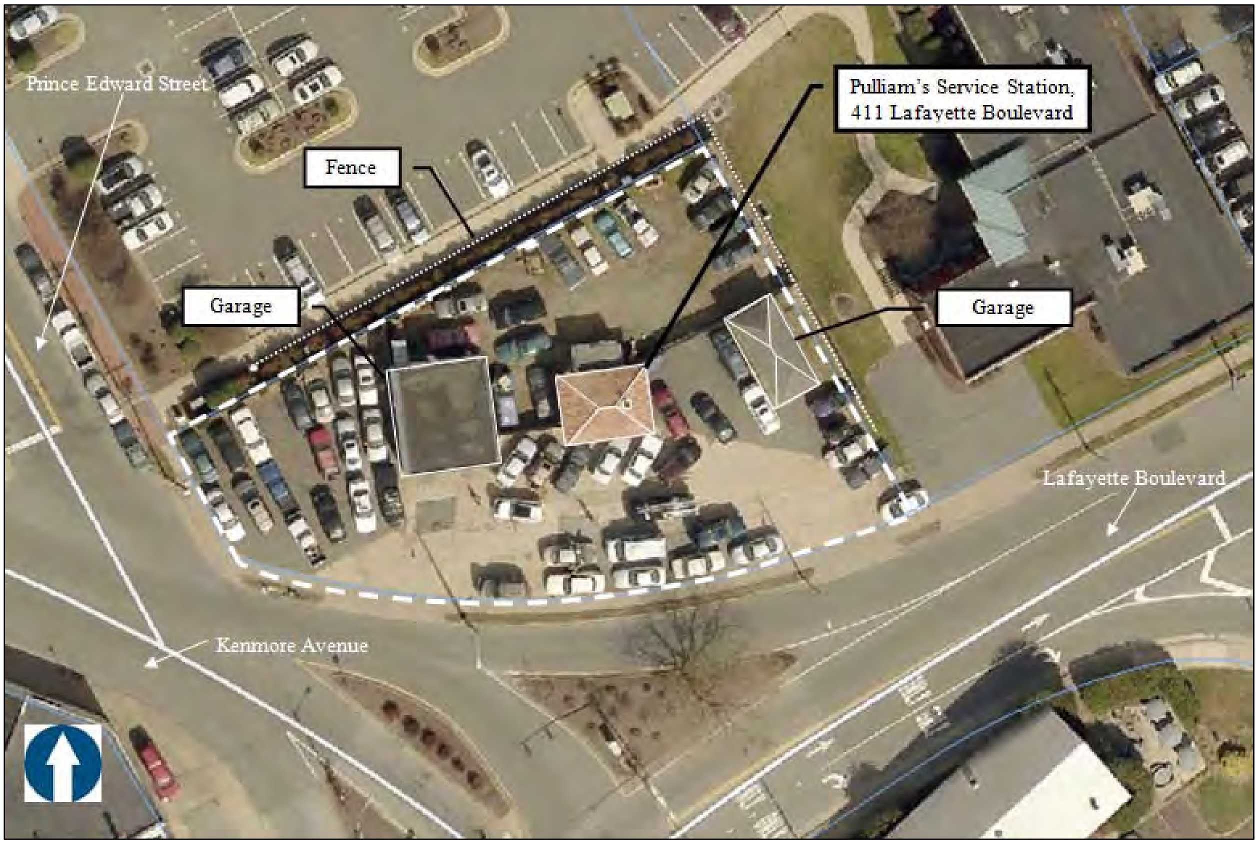

FIGURE 3-92: SITE PLAN OF PULLIAM'S SERVICE STATION (111-0009-0795) (CITY OF FREDERICKSBURG 2017) (NOT TO SCALE)

The primary entrance, marked by full-light wood door topped by a transom window, is centered on the south elevation. Large, square, storefront windows topped by two-pane transoms flank the entry door, and simple paneled pilasters frame either end of the elevation. A band of decorative brick veneer covers the bulkhead panels on the façade (south elevation) and continues along the east and west elevations. The band consists of a five-course section set in an all-stretcher bond bordered at top by a single rowlock course and at the bottom by a single soldier course. Narrow bands of grey trim extend horizontally along the top of each façade, beneath the overhanging eaves.

There are two secondary entrances marked by a single, six-paneled, wood door positioned at the north end of both the east and west elevations, which formerly led to women's and men's restrooms. A single lighting fixture is visible beneath overhanging eaves near the southeast corner of the building and two small cameras are similarly mounted at the southwest corner. Fenestration includes a metal casement window on the east and west elevations, and a small, three-pane, wood-framed, hopper window on the east wall located between the metal casement window and restroom door. A single, small, three-pane, wood-frame window is also visible at either end of the rear (north) elevation. There is a small, rectangular, cinder-block addition centered on the rear elevation of the former filling station (Figure 3-95).

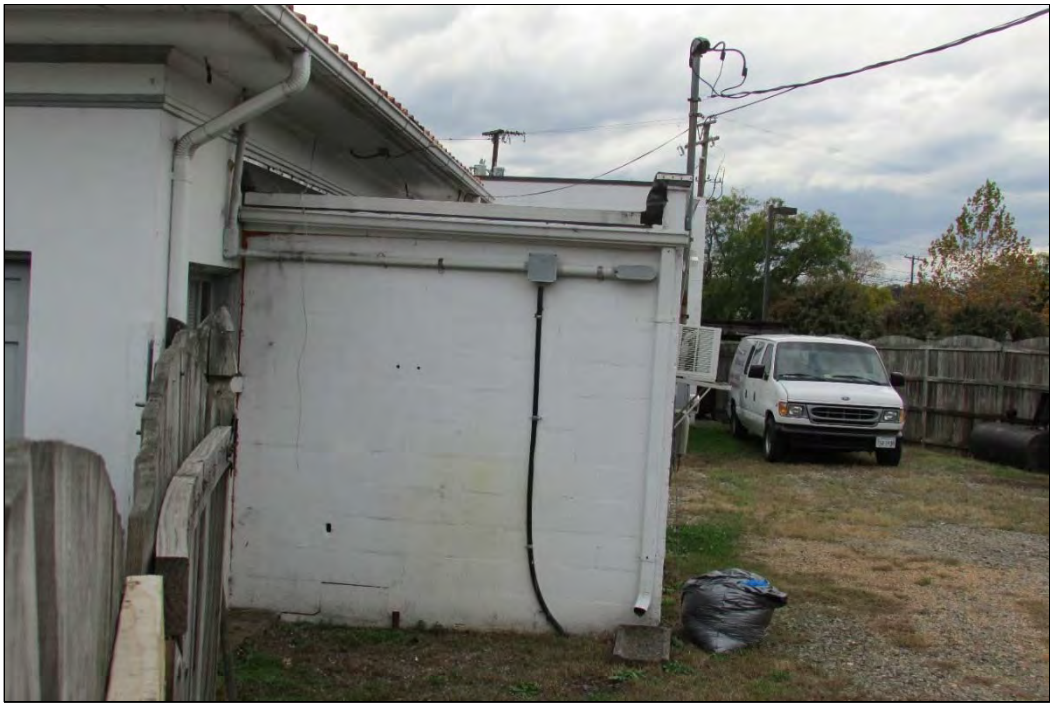

FIGURE 3-95: ONE-STORY, CONCRETE-BLOCK REAR (NORTH) ADDITION

3.7.2.2 Primary Resource Interior

Photographs of the building's interior were not permitted and only limited access was possible during the most recent site visit. Based on a cursory inspection, the original layout appears to be generally intact with an open area at front and a couple of doorways in the north half of the space possibly leading to a storage room and the northeast corner restroom. Such an arrangement was fairly typical of early-twentieth century, house-type, filling stations. The main entrance usually opened into a sales and product display area with, depending on the facility's size, additional rooms, such as an office or storage space, located to the rear. In cases where the design incorporated separate men's and women's facilities, like this resource, interior access to the men's room was also common (Randl 2008).

3.7.2.3 Secondary Resources

The property contains two secondary resources. The first is a circa-1940, one-story, five-bay garage situated near the lot's eastern boundary (Figure 3-96). The building's rectangular plan is oriented north-south with its primary elevation facing west. A concrete foundation supports concrete-block walls and a hipped roof clad in composite shingles with overhanging eaves. The main entrance is marked by a single, slightly recessed, wood door at the center of the west elevation. There is also single-bay garage door opening at the south end of the building. Fenestration includes two, three-over-one, double-hung, wood windows on the south side of the main entrance, a small, four-pane, wood-framed, hopper or awning-style window on the north side of the main entry door, and a similarly-sized, boarded-up window space near the north end of the façade. Four more three-over-one, double-hung, wood windows present on the rear (east) elevation. When originally constructed, this building housed a restaurant, but was later adapted for other uses, including an office for used car business. It presently serves as additional auto service space.

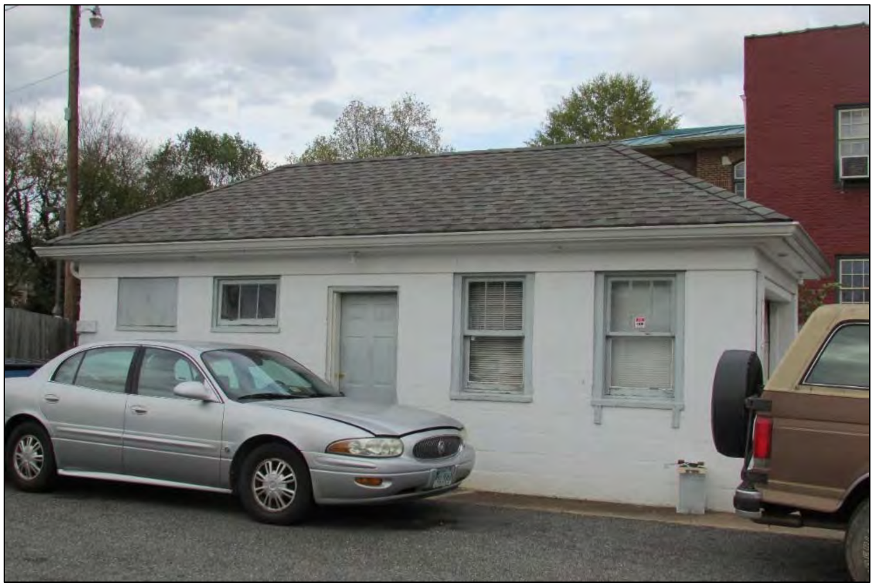

FIGURE 3-96: SOUTHEAST OBLIQUE VIEW OF THE CIRCA-1940, ONE-STORY GARAGE

The lot also contains a circa-1950, one-story, two-bay, concrete-block, service garage located just west of the primary resource (Figure 3-97). The square-plan building is set back from the street roughly the same distance as the filling station with its primary elevation facing south. The building has a concrete slab foundation and a flat roof with metal coping. Overhead segmental garage doors provide access to each bay on the south elevation, and two single-leaf doors on the east wall offer pedestrian access. Fenestration includes two, multi-light, metal windows on the east, west, and north walls.

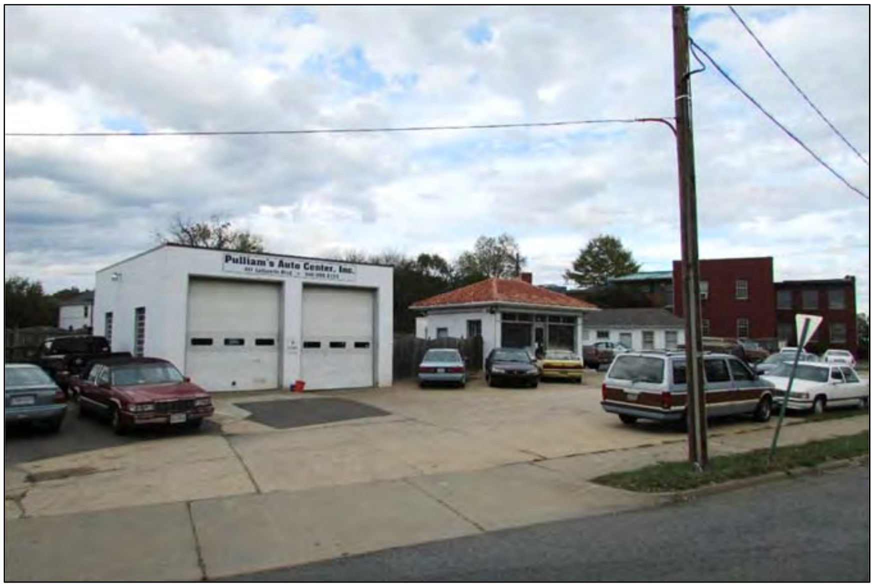

FIGURE 3-97: SOUTHEAST OBLIQUE OF THE CIRCA-1950 SERVICE GARAGE

3.7.3 NRHP Evaluation

The one-story concrete building at 411 Lafayette Boulevard is a Mission Revival-styled, "house-type" filling station constructed around 1937. Popular architectural styles were incorporated into gas station designs to help them blend in with surrounding residential neighborhoods. Eventually, particular designs became closely tied to corporate identities and oil companies began developing standardized designs to help promote brand recognition and sell their products (Blanton 2012:E2). The Texaco Oil Company, which had expanded nationwide, initially developed its Mission Revival-styled stations for its home state and southwest markets, but as the visual link between model and brand solidified, the design was deployed to other areas of the country as well, including the east coast (Moore and Mace 2016:3–5). Only a few known examples remain extant in Virginia (Figure 3-98).

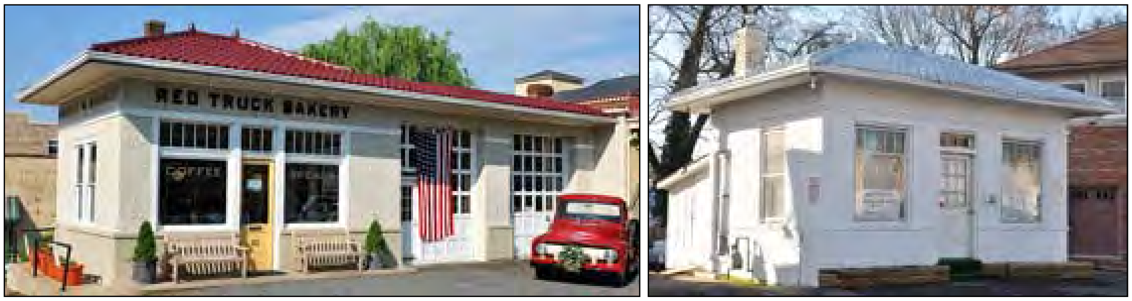

FIGURE 3-98: TWO EARLY TWENTIETH CENTURY, MISSION REVIVAL-STYLED GAS STATIONS IN WARRENTON (LEFT) AND WINCHESTER (RIGHT), VIRGINIA (ROADSIDEARCHITECTURE.COM N.D.)

Though a number of changes have been made to the site over time, including the removal of the original gas pumps and the addition of two new buildings, such alterations are not uncommon and, in fact, reflect the evolution of gas and service station design during the twentieth century, as adjustments were made in response to shifting industry trends and design aesthetics. The former filling station's original design remains intact and readily discernable. It retains key elements of its Mission Revival style, including the stuccoed concrete exterior, hipped roof and terra-cotta barrel tiles, and the decorative band of brickwork at the base of the wall. The scale and interior layout of its "house-type" form, which typified station design during the 1920s and 1930s also remains intact. The original windows also survive. Overall, this resource remains in good condition and retains sufficient integrity of location, design, setting, materials, workmanship, feeling, and association to warrant its consideration for listing in the NRHP.

The former filling station presently known as Pulliam's Service Station is recommended eligible under Criterion A, in the areas of commerce and transportation at the local level, as a reflective example of the important impact that the automobile had on Fredericksburg's economy and built environment during the early decades of the twentieth century. The growing popularity of the automobile combined with coursing Route 1 through Fredericksburg in 1927, had a significant and tangible effect on the city. A host of auto-related businesses, including filling and service stations, tourist homes and motels, dealerships, and restaurants, grew up along gateway corridors and adjoining streets during this period. While many of the buildings that housed those businesses have been lost or repurposed over time, the 411 Lafayette Boulevard complex has continuously served the auto-related needs of travelers and local residents for over three-quarters of a century. It is also an illustrative example of oil companies' efforts to leverage gas station design as a branding tool during the first half of the twentieth century.

The property bears no known associations with any particularly significant individuals, and is therefore not recommended eligible for listing in the NRHP under Criterion B. The former filling station is a good example of a specific building form developed and utilized, in this case by the oil industry, to brand and market products. Its design, which combines the Mission Revival style applied to a house-type gas station, was utilized by the Texaco Oil Company during the 1920s and 1930s to market and brand its auto-related products and services. Moreover, it is one of only a handful of known examples left in Virginia. One of these, a circa-1920 service station, is also located in Fredericksburg (2400 block of Princess Anne Street), but its design and form have been negatively impacted by an out-of-scale, two-bay, service-garage addition that intrudes on the footprint of the original section (Figure 3-98). For these reasons, this resource is also recommended eligible for the NRHP under Criterion C at the local level. As an architectural resource, the property was not evaluated under Criterion D.

In sum, Pulliam's Service Station at 411 Lafayette Boulevard is **recommended eligible for the NRHP under Criterion A at the local level for its association with the important impact that the automobile had on Fredericksburg's economy and built environment during the early decades of the twentieth century, and under Criterion C at the local level as an example of an early-twentieth century, Mission Revival-styled, house-type, gas station, and a building form developed and utilized to brand and market automobile-related products.**

Additionally, this resource is situated within the boundaries of the Fredericksburg Historic District Extension (111-0009). Its date of construction falls within the District's period of significance (1794-1967) and the building's design is reflective of the city's prevailing architectural and historic trends. As such, the property should be **considered a contributing element to the Fredericksburg Historic District Extension.**

The proposed NRHP boundary for Pulliam's Service Station at 411 Lafayette Boulevard follows the legal lot description for one Fredericksburg City parcel: Parcel Number 7789-13-5279 (Figure 3-99). It is bounded on the west and south by the intersection of Prince Edward Street, Kenmore Avenue, and Lafayette Boulevard, on the northeast a two-story commercial property (Parcel Number 7789-13-6375), and on the northwest by an empty lot currently used for parking (Parcel Number 7789-13-4472). The proposed boundary for Pulliam's Service Station includes the service station, two garages, and surrounding parking areas. The period of significance for Pulliam's Service Station begins in circa 1937, when the original fueling station was constructed. Because it continues to be associated with Fredericksburg's automobile industry, the DC2RVA Team applied the NPS 50-year-rule for defining periods of significance for resources "where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997). As such, the period of significance spans from circa 1937 to 1968.

3.8 FREDERICKSBURG HISTORIC DISTRICT EXTENSION (111-0009)

The Fredericksburg Historic District Extension (111-0009) encompasses an approximately 40-block area bordering the north, west, and south margins of Fredericksburg's original 50-block downtown Fredericksburg Historic District (111-0132), listed in the NRHP in 1971 (Figures 3-100 and 3-101). The eastern boundary of the extension district runs along the Rappahannock River at the north end, then follows the west side of the existing Fredericksburg Historic District midway between Prince Edward and Winchester streets, and along the west side of Dixon Street at the south end. To the west, the boundary extends southward along Charles Street for roughly three and a half blocks, where it intersects with the Washington Avenue Historic District (111-5262), Sunken Road, and the Fredericksburg and Confederate Cemeteries (Figure 3-101). At the south end, the margin stretches along Lafayette Boulevard, the Virginia Central Railway Trail, Hazel Run, and Dixon Street. The district was briefly resurveyed as part of reconnaissance studies conducted as part of the DC2RVA project, where it was found that the district remained potentially eligible (Staton and Lesiuk 2015).

Though the proposed extension area contains a handful of late-eighteenth-century resources, including, for example, the 1794 dwelling at 504 Hanover Street known locally as Federal Hill (111-0030), the majority of resources date from the early-nineteenth through the mid-twentieth centuries. The area is characterized by residential neighborhoods intermixed with pockets of industrial and commercial development. Also present are several churches, cemeteries, and other green spaces, schools, and commemorative memorials. The extension area's existing building stock exhibits a wide range of architectural styles, including both high-style and vernacular examples. Collectively, they reflect and embody the community's 200-plus year evolution from eighteenth-century port town to modern city.

3.8.1 Historic Context

The town of Fredericksburg was surveyed and platted in 1727. Almost immediately, the community began to grow and, by 1730, had become the 10th largest shipping port in the colonies. In 1759, continuing growth necessitated the extension of the community's boundaries (Alvey 1978:1–2). The area that is within the current historic district was sparsely populated during the eighteenth century. It comprised a handful of larger farms on the outskirts of the growing town.
